South Wales Power Co., Ltd.—Speaking at the annual meeting last week, Mr. W. Forster Brown, who presided in the absence through illness of the chairman (Mr. W. North Lewis), said that in spite of industrial depression in the district the company had continued to progress. The first stage of the large developments in hand was completed recently, and two 15,000-kW turbo-alternators were running on high-pressure steam. The power station at Treforest now supplied energy for 73,000 h.p. of motors in South Wales and Monmouthshire, and the demand upon it was steadily increasing. Mr. Brown said that, in common with many others, he viewed the Government's Electricity Bill with grave misgivings, and all necessary steps were being taken to safeguard the shareholders' interests.

Cork Electric Tramways and Lighting Co., Ltd.—Mr. A. R. Monks, presiding at the annual meeting on April 15th, said that the tramway results had been unsatisfactory, and there was a small loss on operating to which had to be added renewal and depreciation charges. Under pressure from the Ministry, they had reduced their fares in the autumn of 1924, and the financial results on the basis of the present fares would always be unsatisfactory. The reduction in the lighting and power revenue was partly due to the small falling off in the power demands and partly to the reduced power and heating tariffs.

Low Temperature Carbonisation, Ltd.—Steps are being taken to reduce the capital of the company from £1,275,000 to £162,150 10s. by cancelling 2s. 6d. per share on the "A" preference shares, 17s. 6d. on each of the participating preference shares, and 18s. on each of the ordinary shares. The capital will then be reinstated to £1,275,000 all in ordinary shares of 2s. each, and it is proposed to issue £284,841 of 8 per cent. cumulative income debentures. The debenture holders are asked to accept new stock and ordinary shares in exchange for their holdings.

Great Northern Telegraph Co., Ltd.—The directors propose to distribute a total dividend and bonus of 20 per cent., including the 5 per cent. already paid, for the year 1925, and to transfer £19,444 to the reserve and renewal fund, and £37,500 to the pension fund. It is also proposed to carry forward £244,438. The annual meeting will be held at Copenhagen on May 28th.

Indo-European Telegraph Co., Ltd.—The directors recommend a final dividend of £1 2s. 6d. per share and a bonus of 15s. per share, both free of tax, making a total distribution of 10 per cent., tax free, for 1925. The dividend for 1924 was the same but the bonus was only 7s. 6d. The annual meeting is to be held on April 29th.

Northern General Transport Co., Ltd.—The report for the past year shows a net revenue of £101,630. After meeting loan and debenture interest, &c., and adding £8,305 brought forward, a sum of £53,664 remains. It is proposed to pay a dividend of 10 per cent. (2½ per cent. already paid), to place £3,000 to reserve and £2,053 to debenture sinking fund, leaving £7,111 to be carried forward. The meeting was to be held yesterday (Thursday), when a resolution was to be submitted empowering the directors to increase the capital to £700,000 by the creation of 50,000 six per cent. preference and 150,000 ordinary shares of £1 each. The directors have decided to offer 118,750 ordinary shares at par to present holders in the ratio of one to four.

Wycombe (Borough) Electric Light and Power Co., Ltd.—The balance available from 1925, after meeting debenture interest, preference dividends, &c., and adding the amount brought forward, was £11,782. An interim dividend of 4 per cent., free of tax, on the ordinary shares absorbed £2,500, and at the annual meeting on April 13th it was decided to allocate the balance as follows:—Final dividend of 6 per cent., free of tax; £4,000 to general reserve; £500 to superannuation account; leaving £1,032 to be carried forward. The directors issued £25,000 in ordinary shares during the year and additional plant and cables have been ordered to meet the growing demand.

Simms Motor Units (1920), Ltd.—In his speech at the annual meeting on April 14th, the chairman (Mr. F. R. Simms) said that the trading results for the past year had been very satisfactory, enabling the directors again to declare a dividend of 10 per cent., and to increase the carry forward from £19,742 to £33,171. A branch had been opened in New Zealand and two British branches and one in Canada would be opened during the current year. The directors intended to extend their branch policy over India and the British Dominions, so as to be able to give "Simms Electric Empire Service," coupled with a proved sales policy.

Carmarthen Electric Supply Co., Ltd.—The accounts for 1925 showed a profit of £2,571 and to this was added £584 brought forward, making £3,155. The interim dividends absorbed £410 (including one at the rate of 7½ per cent. on the ordinary), £600 is transferred to depreciation fund, and £500 to capital reserve account. The final dividend on the ordinary shares is at the rate of 3¾ per cent. for the half-year and a bonus of 2½ per cent. is also paid. A balance of £902 is carried forward. Prices to consumers have been reduced.

Kalgoorlie Electric Power Corporation, Ltd.—The Perth (W.A.) correspondent of the *Financial Times* reports that the Western Australian Government has offered to render financial assistance to the company to enable it to extend its plant. It is anticipated that this would result in a reduction of ore-treatment costs and would prolong the lives of the mines by enabling low-grade ore to be worked profitably.

Stock Exchange Notice.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Calcutta Electric Supply Corporation, Ltd.—150,000 new 5 per cent. cumulative preference shares of £1 each, fully paid, Nos. 2,375,001 to 2,525,000 150,000 new ordinary shares of £1 each, issued at £1 13s. per share, partly paid and fully paid, Nos. 1,216,711 to 1,366,710.

Montevideo Telephone Co., Ltd.—An interim dividend at the rate of 6 per cent. per annum has been declared on the ordinary shares in respect of the year ending July 31st. Last year's interim dividend was at the rate of 4 per cent.

Joseph Lucas, Ltd.—Interim dividends of 5 per cent. on the ordinary shares (against 2½ per cent.) and of 2½ per cent. on the 1926 ordinary have been declared in respect of the year ending August 31st.

English Electric Co., Ltd.—The annual meeting was held on Wednesday last. A report of the proceedings will appear in our next issue.

Stocks and Shares.

MONDAY EVENING.

ACCORDING to the various phases of the coal situation, so do Stock Exchange markets ebb and flow in the matter of their price-fluctuations. These movements are brought about, as a rule, as much by sentiment as by actual orders, for trade is exceedingly slack, and in no market can it be said that there is anything that approaches liveliness. The fate of the Electricity Supply Bill is expected to be settled one way or the other in the present session of Parliament, but, as a market factor, it is completely over-shadowed by more pressing industrial problems.

The feature of the week, so far as our markets are concerned, is another sharp rise in the issues of the Underground Electric Railways of London, where optimism has again become pronounced over the expectation of a dividend announcement, joined to the anticipation of some form of capital reorganisation—so often canvassed during the past ten years. The £10 shares gained 7/6 at 3¾ and the "A" shares are up to 12/-. The 4½ per cent. bonds have risen to 101. Even the Contingent Certificates have increased their value by about 50 per cent., standing now at the lordly price of 6d. each. Districts strengthened to 51, but no changes occurred in Central Londons or Metropolitans. There is a good deal of speculation afoot in Underground Electrics, mostly of that kind, how-

ever, in which the buyers pay for what they purchase, content to wait upon the future for a profit rather than to look for an immediate gain.

Sir Douglas Hogg, K.C., is in charge of the Electricity Bill in its passage through Committee. The Industrial Group held a meeting last week, in the House of Commons, with the intention of considering the Bill, and of deciding what assistance should be offered to secure its safe conduct through the Committee stage. It was agreed to propose a series of amendments for the purpose of fortifying the Bill, and, although this was unofficial, hints were given that the Government would look favourably upon the group's movements. With regard to the price movements in the market, the tendency is dull, owing to the coal outlook. Bournemouths have gone back to 58/3 and Chelseas have come on offer, shares changing hands down to 38/6. A fall of 5/- in Kensingtons lowered the price to 13½, Westminsters fell 1/9 to 42/-, Metropolitans to 35/9. Midland Counties remain heavy, upon the apprehensions of shareholders who are timid in regard to the effect which the Government Bill may have upon companies such as this.

The only improvement in this week's list is secured by Urban Ordinary, the price of which has risen to 20/6. City Lights are unchanged at 44/6. Protests are again being made by the City Corporation against the price of electricity, and a speaker at one of the meetings the other day maintained that prices are still much too high, and that citizens must not rest content until the rates approximate more nearly to those paid by neighbouring boroughs. The chairman at the Bournemouth and Poole meeting declared that his company is willing to become a centre of supply, or to obtain cheaper bulk supply elsewhere.

Amongst the cable stocks and shares, Indo-European have risen 2 to 47½, on declaration of a final dividend of £1 2s. 6d. and a bonus of 15s., both free of tax, making 10 per cent. tax-free for the year. This is an increase of 1½ per cent., and the market is very well satisfied. On the other hand, Great Northerns are £2 down at 30, there having been a little selling from Copenhagen. The Montevideo Telephone Company has declared an interim dividend at the rate of 6 per cent. on the ordinary shares, as against 4 per cent. this time last year. The price is better at 23/9. It may be recalled that the final dividend paid last November was 5 per cent., and it is assumed that the final for the current twelve months will show an increase upon this rate. Chili Telephones are ⅛ up at 6⅞ and Orientals are firmer at 42/-. The Marconi group is placid. Radios have steadied after their violent slump and recovery. Automatic Telephones keep about 48/9 and Internationals have been changing hands on the basis of 43/9.

Electric Supply Corporations remain at 32/6, and at the meeting last week it was stated that potential cheaper supply will be worth while, even at the cost of shutting down small generating stations. The speaker, Mr. K. A. Scott-Moncrieff, said that he hoped the Electricity Bill would be strengthened in the Committee stage, so that its purpose might be achieved on equitable lines. English Electric shares rallied a trifle to 15/-. The report states that an outstanding feature of the company's business at the present moment is the fact that the unexecuted orders on its books already exceed the whole output for last year. This suggests that the progress in the present financial year will be such as to wipe out the memory of the unfortunate 1925, with its absence of dividend for ordinary shareholders.

Manufacturing shares are dull as a whole. Edisons have gone back to 7/9, General Electrics to 28/3, Electric Constructions to 30/- and Brush to 25/9. The same story has to be repeated in regard to the cable construction shares, where declines have occurred in Callenders, Siemens, Johnson and Phillips and India Rubber. Babcock & Wilcox hold their price at 53/9, the comparatively small return which the shares offer at the present time being taken as no more than an earnest of what the company will be able to achieve when trade settles into more prosperous lines.

British Electric Traction ordinary retains its gain of 5 points, and it is taken for granted that the company will declare an increased dividend. Attention has been drawn to the company's preference, the price of which stands at 107. The stock carries participating rights, and optimism looks for a possible 8 per cent. dividend on this stock in the course of time. The company is managed on cautious and safe lines. As a sound investment of the lock-up type, the stock is reasonably priced at the present quotation. Brazilian Tractions are lower, Canada having come in a seller, and Anglo-Argentines have made no further addition to their improvements of last week. Mexicans are a little better. A few of the Indian Industrials have been disposed to weaken, in consequence of the recent rioting in Calcutta. In Calcutta Electric Supply Shares, however, no particular change has occurred, and the price of the new ordinary is better at 3/3 premium. Lancashire new shares are 23/6.

The rubber share market has been depressed by a further fall in the price of the commodity to 1s. 10½d. per lb. Many of the best-class companies are now declaring dividends that afford, at the current quotations of the shares, about 12½ per cent. on the money. With the price of rubber so dull, it is natural enough that the public should feel indisposed to take any particular hand in the market at a time when industrial conditions do not encourage capital to seek speculative investments. The American buyer controls the situation in regard to the demand for raw rubber. "Dollar" stocks have fallen: Montreal Light and Power at 228 and Shawinigan Water at 184½ both show losses of 5 points.

Electricity in Coal Mines.—II.

A Survey of the Present Position in British Mines.

(*Abstracts of Papers read before the* Institution of Electrical Engineers.)

It will be recalled that the three papers which were presented to the Institution on April 8th provided members with a general review of the present position of electricity in mines, the application of machinery at the coal face, and the design of storage-battery locomotives for use therein. One of the papers, together with the discussion on all three, was abstracted in our issue of April 16th; the other two are dealt with below:—

The Design of Battery Locomotives.

By L. Miller, A.M.I.E.E.—*Abstract.*

The average cost of power in a mine works out at 1s. per ton of coal produced; therefore, any slight saving in power which might be achieved by the use of locomotives cannot have very much effect on the cost of the coal at the pit mouth. Any gain in output which may result from the more efficient gathering and conveying of the coal to the surface may, however, have quite a considerable effect on the price.

In considering the use of locomotives to replace rope-haulage systems, there is no doubt a very good case to be made out from the point of view of power-saving and efficient and speedy handling of the loaded trains, provided that the haulage roads are level. If gradients and faults exist, then the locomotive cannot compete with rope haulage from the point of view of speed; in fact, if the gradients are much worse than 1 in 20 the use of a locomotive may be quite impracticable.

For gathering work the locomotive cannot compete with a conveyor system from the point of view of speed. Conveyor systems can be used economically only in thick seams; in thin seams for gathering and marshalling the loaded tubs on the main haulage road and for keeping a supply of empty tubs at the coal face, the battery locomotive can be used to replace the pit pony with satisfactory results from the point of view of speed and cost and also from the purely humanitarian point of view. The locomotive can also be efficiently employed for marshalling purposes at the junction of haulage roads.

After detailing the limitations placed on the design and dimensions of a mine locomotive, it is stated that as its use can only be economically justified on narrow seams, cost is of paramount importance. Standardisation is, of course, the most satisfactory way of keeping down the cost, having got the simplest design, but the chief difficulty affecting standardisation is the gauge question. The B.E.S.A. Report on Colliery Light Rails [C.A. (C.R.) 9,295] shows that out of a total of 468 collieries 132 are using the 2-ft. gauge; there are 56 different gauges in use.

In designing a battery, the largest possible individual cells that can be accommodated in the space available should be used, which will tend to keep the voltage below 80, rather than above it. The two-motor scheme has the advantage that by connecting the armatures and fields in series-parallel it is possible to do away entirely with resistances. On straight runs any advantage due to this will not appear, but in marshalling the tubs and manœuvring, which will have to be done at a restricted speed, the advantage of the two-motor scheme will be apparent; in America the actual power consumption in service has been found to be very much in favour of the two-motor arrangement. The motor short-time rating of 1.64 h.p. per ton per mile per hour is obtained when a coefficient of adhesion of 25 per cent. is employed, plus 1 per cent. for the locomotive friction; the efficiency of the gears is taken at 95 per cent. The 1-hour rating of the motors on locomotives employed for gathering service can usually be taken at roughly half this figure where the grades do not exceed 5 per cent. and are not long.

Many things affect the adhesion factor, and the author recently had some tests carried out on an 18-in. diameter steel wheel which show the effect of several variables on the coefficient of adhesion, but the experiment gives no new information. Attention is called to the effect of increasing the lines of contact from ½ in. to 1¼ in., which shows a marked improvement in the coefficient. This illustrates the importance, from the point of view of adhesion, of using flat-topped rails. Increasing the diameter of the wheel also tends to increase the coefficient of adhesion. It is quite clear from the tests that the sanding apparatus is of great importance in obtaining good adhesion, and the sanding gear should be so designed that it cannot be put out of action when going through water.

The trend of development in controller design for heavy service is towards the contactor type. It is extremely inadvisable to rely on fuses for over-load protection. The best arrangement is an interlocked circuit breaker which can be replaced only when the controller is in the "off" position. Regarding methods of gearing the motor to the driving axle, in America the tendency is to adopt either spur or worm gearing, and the chain drive is not regarded as sufficiently robust for the service. This is what would be expected for American conditions, where a great many large trolley locomotives are in service on straight haulage work and operating at speeds up to 10 miles per hour at their rated draw-bar pull. For the small powers and low speeds required for gathering service the author believes that a properly designed chain drive will give satisfactory service. It is cheap and easily renewed at low cost, and can be accommodated in a small space without sacrificing the necessary clearance required to avoid the obstructions in the haulage roads.

The saving in power due to the use of roller bearings in the tub and locomotive axle bearings will amount to 40 per cent. of the power required to overcome friction. The use of ball bearings on the motor will result in a reduction in the length between bearings and will assist in obtaining a satisfactory flame-proof design.

The actual saving in power consumption taking into account braking, flange and air friction, grades and curves, will probably amount to as much as 20 per cent., which will enable a smaller battery capacity to be utilised for the same amount of work. The extra capital cost entailed in fitting roller bearings to the tub and locomotive axle bearings should be wiped off very soon. Roller bearings are, however, not likely to be received with any enthusiasm by the colliery personnel.

It has been suggested that where the gate roads are such as to have a heavy grade against the loaded tubs, or where they are of such dimensions as to make it difficult for the locomotive to proceed to the coal face, a winch driven by the propelling motor would be an advantage. This would enable the full rated power of the motors to be utilised without considering the question of adhesion, and the loaded tubs could be hauled up a grade on which the locomotive could not operate. In fact the locomotive would, in addition to its marshalling duties, act as a portable haulage. By arranging a sheave on the roof timbers it could be utilised when erecting or dismantling pumps, coal-cutters, erecting or withdrawing props, &c.

The problem of providing suitable flame protection resolves itself into flange protection, which, without any doubt whatever, is simple and most effective.

No data are available, so far as the author is aware, as to the running costs of locomotives as compared with ponies on gathering service in this country.

A gathering locomotive will cost £400 to £500 per annum to run, and it will be necessary to replace at least three ponies to cover this expense. Where it is possible for the locomotive to replace six pit ponies the case is very strongly in favour of the battery locomotive, from the point of view of running cost and speed of handling the coal.

Machinery at the Coal Face.

By Sam Mavor, M.I.E.E.—*Abstract.*

The mining industry of this country contains within itself the means of its own regeneration, and if relieved of legislative interference these means would become increasingly operative. It is impossible for anyone familiar with recent practice in mechanical coal-mining and with its economic results, to be otherwise than optimistic as to the future of the industry if the colliery owners and the miners are left to settle their own affairs. The problem of cost reduction is that of increasing individual output, but in mining this problem has special significance because labour accounts for 75 per cent. of the total cost of production, and apart from the number of working hours, the only way to effect substantial increase of output per man and consequent reduction of costs is the systematic application of labour-saving machinery. In other words, there are too many men in the mines; the number must be reduced, for the industry cannot afford to support them. The necessarily gradual nature of the process of adapting mining methods to the use of machinery will to a great extent avoid the imposing of individual hardship by reduction in the number of men employed. At many collieries modern coal-producing machinery is even in these days of low prices earning profits that without it would be non-existent. Unsettlement and the sense of insecurity have seriously retarded progress in the equipment of mines with machinery of production, and have thus accentuated the difficulties of the present situation.

In England the proportion of machine-cut coal to the total output is, according to the latest Report of the Mines Department, 14 per cent., whereas in Scotland the proportion is 47 per cent. The geological conditions in Scotland are not more favourable to machine mining; the difference is due partly to economic pressure compelling a reduction in cost of production, but largely to the permissibility of electricity at the coal face in most of the Scottish mines. In Scotland 93.25 per cent. of the coal-cutters in use are electric and 6.75 per cent. are compressed-air machines. It is not generally realised that a very important factor in the rapid extension of machine mining in the United States is that the comparative freedom from gas in the mines renders electricity permissible, and it is noteworthy that in the most recent years the rate of increase in the proportion of machine-mined coal has been greater in Scotland than in the United States.

The surface equipment of many collieries is splendid, but underground, where the money is lost or made, the coal faces

are crying out for machinery for winning the coal and conveying it from the immediate vicinity of the face—operations to which the whole surface and underground equipment and organisation of the mine are secondary.

Following a general outline of the principal characteristics of the coal seams of this country and of the methods by which they are mined, the development of the mechanical coal-cutter is dealt with, it being pointed out that the design of electric motors for coal-cutters is subject to many limitations. The problem is presented to the electrical designer from a totally different aspect, and the ordinary canons of electric motor design cannot be applied.

There is no recognised standard of power rating of coal-cutter motors, each maker's rating is individual and arbitrary, and, whilst it may serve for comparison of different machines by the same maker, the absence of a uniform basis prevents useful comparison of the rating of machines by different makers. The mean and the maximum powers required by the bar cutter are less than for the chain and disk types; the chain type is next in order, the greatest being required by the disk machine.

Where the mining conditions are favourable and systematic coal-cutting has been established, the machine takes the primary part in a cycle of operations organised to time table for production of 70 to 150 tons per shift, and in which 20 to 50 men (according to the seam conditions) may be engaged. The penalty of failure of the machine to fulfil its part is disorganisation of the whole scheme, suspension of the correlated operations, loss of wages to the men, loss of output and serious increase of costs to the colliery.

With the compressed-air driven coal-cutters the b.h.p.-hours required to be delivered to the compressors is roughly between four and five times that required to be delivered to electric generators for an equal amount of useful work done by coal-cutters. This relatively low efficiency of compressed air is partly inherent in the system as applied to colliery service, and partly due to the conditions under which coal-cutters are used. Wherever considerations of safety do not preclude the use of electricity for coal-cutting, electricity should always be adopted. There are, however, a large number of collieries in this country where there is no alternative to compressed air and its indispensability condones its relative inefficiency. Generally, compressed-air power systems are much less efficient than they might be, because engineers in charge have not yet acquired the habit of measurement that has so importantly contributed to efficiency in electrical engineering. Generally, compressed air is sent underground without being measured, and there is no check upon extravagance in its use or waste.

The b.h.p. rating of coal-cutters is arbitrary; the rated powers of the machines in most general use are between 20 and 50 b.h.p., but all have large overload capacity for short periods, and not infrequently they are required to develop it. Under normal conditions the energy delivered to electric coal-cutters per square yard undercut varies from about 0.2 kWh in the most easily cut materials to about 1.0 kWh in the hardest cuttable materials. The average may be taken as 0.4 to 0.5 kWh; the equivalent in the case of compressed-air machines is much higher, especially in the case of harder materials.

The application of power to the conveying of coal at and in the vicinity of the coal face is technically and economically essential to intensive mining in which the productive effort is concentrated and large outputs are obtained from comparatively small areas. Coal-cutters increase largely the yield of coal per lineal yard of face per day, and, if full advantage is to be realised from the machines, the coal produced must be promptly removed from the faces. The workings of most existing collieries are laid out for hand-mining, and the fact that the difficulties of dealing with the output from coal-cutters, without radical change in methods of loading the coal and delivering it to the mechanical haulage, are practically insuperable is becoming more widely recognised.

The drilling of rock or other strata too hard for cutting by the edge of a rotating drill is a special problem. The material must be attacked by percussive blows and the tool must reciprocate. The difficulties of applying electric power to this service are well known; the compressed-air drill holds the field.

Closely allied to the application of electric power at the coal face is the problem of improved lighting. At most modern collieries the pit bottoms are now not merely lighted by electric lamps—they are illuminated—and illumination pays because it facilitates activity and promotes safety in the operations conducted. There can be no doubt as to the desirability of improved lighting at conveyor faces. Prof. W. M. Thornton has gone far towards making available, in closed-lamp pits, the advantages of coal-face illumination that have been demonstrated where the use of existing equipment is permissible.

It must be accepted that electricity will continue to be excluded from the coal face in many collieries, but the number of these may be reduced by fuller knowledge by mining men of the characteristics of mining electrical appliances and of the conditions essential to securing and maintaining the highest degree of safety in their use, and by fuller knowledge by electrical men of the conditions of service of coal-face machinery and other in-bye electrical apparatus and of the rough nature of the treatment to which it is unavoidably subjected.

Practice of the intensive methods of mining, rendered possible by coal-face machinery, has a bearing on the permissibility of the in-bye use of electricity. The reduced pit room, the less surface of exposed gas-bearing coal, the diminished number, increased area, and improved maintenance of the air ways, and reduction of air leakages between intakes and returns, are all favourable to more effective ventilation, and therefore to safety in the use of electricity. On the other hand, the more rapid advance of the workings may in some gaseous seams liberate so much gas as to exclude electrical appliances at the face. This also applies to seams liable to the occurrence of sudden outbursts of gas, and to places in the working of normal seams where accumulation of gas may be difficult to avoid.

Everyone familiar with underground conditions knows the difficulty of securing adequate maintenance of underground electrical apparatus. It takes time to train the personnel, but experience is educating mining men in the necessity for due attention to this subject, and improvement is progressive. At large collieries with competent electrical staffs, adequate in number, very good standards of maintenance exist; only at such collieries is it wise to send underground delicate automatic devices which are only a snare if their condition and adjustment are not properly maintained.

In the main, the sphere of electricity underground will continue to be in the secondary services—ventilating, pumping, hauling and winding. In application to the primary processes of mining at and near the coal face, the use of electricity is restricted; although increasing confidence in electricity may lead to some relaxation, it is certain that compressed air, displaced by electricity from important services at and near the shaft and in intake airways, will be very much more difficult to dislodge from the region of the coal face.

The services of the mechanical and electrical engineer to the mining industry have been manifold, but abundant opportunity remains and the measure of it is the high cost of coal production. The output per underground worker is too low, therefore too many men are in the industry—that is why wages are low and costs are high. By mechanical and electrical aids to production the output per man can be increased, wages and the status of the miner can be raised, and the cost and price of coal can be reduced.

A Special Electric Furnace.

In a paper read recently before the Institute of Metals by Mr. Douglas Jepson, M.Sc., a special type of electric resistance furnace, employed in connection with experiments on the influence of gases on copper at high temperatures, is described. It can be evacuated or filled with any desired gas, and contains a crucible which holds the substance under treatment and which can be lowered from the heating zone into a water-cooled chamber, thus giving a very rapid and reproducible rate of cooling. This arrangement was found necessary, for the

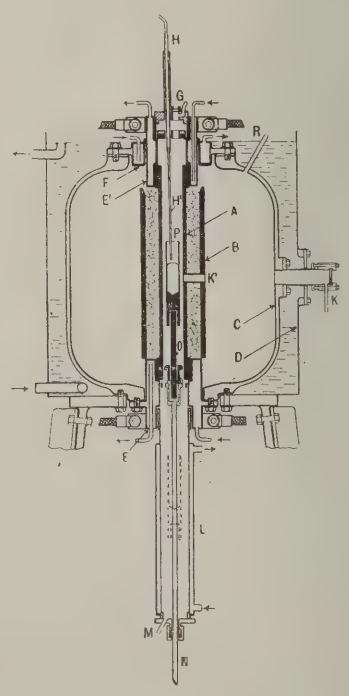

Fig. 1.—An Experimental Electric Furnace.

purposes of the investigations, after a large number of preliminary experiments had been made with a simpler type of furnace.

This furnace, fig. 1, contains a carbon resistor tube A, 520 mm. long, 66 mm. external diameter, and 48 mm. bore; this is fitted into graphite adaptors by means of accurately ground taper joints, the bushes being soldered to the electrodes E and E'. In order to reduce radiation losses, A is surrounded by another carbon tube B, insulated from the lower electrode E on which it stands, the intervening space being filled with wood charcoal. The cast-iron essvel C is entirely surrounded by water contained in the galvanised iron jacket D. The bottom water-cooled electrode E is bolted, with a vacuum-

tight joint, direct into the vessel C, whilst the top electrode E' is left free to slide in a water-cooled, insulated collar F, the sliding joint being made vacuum tight with a flexible wax. E, E', and F are made of best quality gun-metal. The top electrode is provided with a cap having two openings, one fitted with a glass window G for general observation, and the other with a sliding sheath H holding a narrow carbon tube H', which can thus be raised or lowered into the furnace. A second observation window is fitted in the side of the furnace at K, a short carbon tube connecting the corresponding apertures in the large tubes. Below the lower electrode is a water-cooled copper cylinder L of similar length to the resistor, the bottom end being closed with a removable cap M, having a special gland through which passes a long steel rod N. The upper end of the steel rod carries a series of radiation screens and an insulated carbon rod O, which in turn supports the graphite crucible P, the inside of which is 125 mm. deep and 25 mm. in diameter. Below the furnace, which is supported 4 ft. above the ground, the steel rod is connected with a long wooden lever by means of which the crucible can be moved steadily and rapidly up or down. To ensure perfectly parallel motion the rod is continued through a bush in the floor.

Evacuation of the furnace is effected by a large rotary oil-pump connected to the cast-iron vessel by a wide-bore tube R. Gas may be admitted at any of the points H, G, K, or M, the first directing the gas into the crucible, and G and K enabling the sight tubes to be kept free from fumes. A mercury manometer is also connected to the top of the furnace. Gases may be allowed to escape either at R or M.

The method of mounting the resistor with taper joints, and the holding of the upper electrode so as to be free to move only in a vertical direction, have resulted in the life of the tube being very greatly increased.

The furnace can be evacuated down to a pressure of 3 mm. of mercury in about 10 min., this vacuum being sufficient for the experimental requirements. The temperature can be raised to 2,000 deg. C. in 15 min. without undue strain. To maintain a temperature of 2,000 deg. C. in hydrogen a current of 1,550 A at 10.75 V is employed. Single-phase energy at 50 cycles is supplied from a separately excited motor generator with pressure-controlling rheostats in the field.

India's Electrical Imports.

(From Our Indian Correspondent.)

THE total value of the electrical imports into India during the calendar year 1925 was Rs.437 lakhs. This is a satisfactory advance on the previous year, during which the total trade amounted to 392 lakhs. Of the total trade, electrical machinery accounted for 210 lakhs, as against 199 lakhs in the previous year, while electrical instruments and apparatus were responsible for 227 lakhs, as against 193 lakhs in 1924. The United Kingdom increased its share from 308 lakhs to 332 lakhs, Germany from 25 to 31 lakhs, and the United States from 29 to 37 lakhs. The principal classes and values were as follows:—

	1924. Rs. lakhs.	1925. Rs. lakhs.
Control and switchgear	37.7	37.8
Generators, alternators and dynamos	33	34.5
Motors	42.6	36.6
Transformers	14.5	13.7
Turbo-generator sets	7.3	15.2
Other sorts	64.3	71.9

Two developments deserve to be noted in the table above. One is the continued decline in the imports of motors, which are now less than half of what they were in 1923. The other is the continued increase in the imports of turbo-generator sets, which more than doubled during the year.

As regards the sources of the electrical machinery, the shares of the different countries were as follows:—

	1924. Rs. lakhs.	1925. Rs. lakhs.
United Kingdom	170.4	174.8
Sweden	1.6	1
Germany	4.9	8.8
United States	13.7	17.3
Other countries	8.8	8

The share of the United Kingdom is steadily increasing. It was 147 lakhs in 1923, 170½ lakhs in 1924 and about 175 lakhs in 1925. Germany during recent years has also been making progress. In 1923 her imports amounted to Rs. 2 lakhs only. They doubled in 1924, and also practically doubled again in 1925. In the case of the United States there appears to be some improvement during the year, but its share has dwindled materially during recent years. In 1923 imports from that country amounted to 43.7 lakhs, but in 1924 they were only 13 lakhs.

As regards electrical instruments and apparatus, the imports of the various kinds of goods were as follows:—

	1924. Rs. lakhs.	1925. Rs. lakhs.
Electrical fans and parts	25.4	28
Electric wires and cables	62.3	81.7
Telegraph and telephone instruments and apparatus	11.9	8.5
Electric glow lamps	12.5	17.9
Electric lamps (other sorts)	3.5	3.8
Parts and accessories of electric lamps	1.2	2.3
Batteries	6.9	8.9
Electric carbons	0.7	0.7
Accumulators	8.6	12.7
Condensers	0.3	0.2
Electric bell apparatus	0.1	0.2
Electric lighting accessories and fittings	13.4	15.7
Meters	6.4	6
Other sorts of electrical instruments	1.5	4.2
Electro-medical apparatus	0.9	1.9
Switchboards	4.7	3.2
Unenumerated	32.5	30.7

The sources of these imports were as follows:—

	1924. Rs. lakhs.	1925. Rs. lakhs.
United Kingdom	138.8	157.6
Germany	20.5	21.8
Netherlands	7.1	8.7
Italy	5.8	6.2
Japan	1.6	3
United States	16.3	20.4
Other countries	3	9

The United Kingdom's share, though it increased during the year, was short by about 5 lakhs of the 1923 figure. Germany, Italy and the Netherlands is showing continued progress. The imports from the United States in 1923 were valued at 18 lakhs.

An analysis of the various types of goods shows that in the case of electric fans and parts the United Kingdom's share increased from 12.4 to 16.3 lakhs, and that of Italy from 5.3 to 5.8 lakhs, but the share of the United States fell from 2.8 to 1.3 lakhs. In the case of the insulated rubber wire, the total imports, of which amounted to 41 lakhs, as against 23.7 lakhs in the previous year, the imports from the United Kingdom increased from 21.8 to 37.8 lakhs, and those from Germany from 1 lakh to 2.1 lakhs. In other insulations, of which the imports were valued at 21.3 lakhs as against 17.6 lakhs, the share of the United Kingdom rose from 16 to 19.4 lakhs. In telegraph and telephone wires and cables, there was a heavy decline in total imports from 6.1 to 1.6 lakhs and the United Kingdom's share consequently declined from 5.9 to 1.4 lakhs. This was due to the growth of the Indian production under the encouragement of the Government of India. The imports of bare (electrolytic) copper wire increased from 14.8 to 17.7 lakhs, and the United Kingdom's share from 14 to 14.8 lakhs. Of the total electric wires and cables, the United Kingdom's share was 73½ lakhs, as against 58 lakhs, in the previous year; Germany's 4.4 lakhs, as against 2 lakhs; and the share of the Netherlands 2.2 lakhs, as against 1.2 lakhs. In telegraph and telephone apparatus the share of the United Kingdom declined from 11.2 to 7.4 lakhs. In electric glow lamps there was close competition between the United Kingdom and the Netherlands, the former's share amounting to 6.5 lakhs and the latter's to 5.9 lakhs. In the face of this competition from the Netherlands, the United Kingdom was able to increase her share from 3.9 to 6.5 lakhs. The share of Germany declined from 1.8 to 1.2 lakhs. In other kinds of electric lamps, the United Kingdom's share was very small, being only Rs. 44,000; the United States was the principal supplier, her share having increased from 1.9 to 2.6 lakhs. In the case of batteries, the United Kingdom's share increased from 3.7 to 4.4 lakhs, and that of the United States from 2 to 2.3 lakhs. In accumulators the United Kingdom's share rose from 6.9 to 9.7 lakhs. In electric lighting accessories and fittings, imports from the United Kingdom practically remained stationary at 8.9 lakhs, while the United States increased her share from 2.5 to 4.6 lakhs, and Germany from 1.5 to 1.8 lakhs. The United Kingdom's share in meters declined from 4.5 to 4.3 lakhs, and in switchboards it declined from 4.6 to 3 lakhs. In the case of unenumerated goods the imports from the United Kingdom fell from 21.6 to 19.3 lakhs, and those from Germany from 5.9 to 4.8 lakhs, but those from the United States increased from 3 to 3.8 lakhs.

Vehicle Operating Cost Tables.—The *Commercial Motor* Tables of Operating Costs of all types of goods and passenger-carrying petrol, steam, and electric commercial vehicles are now in their 18th year of publication. The current tables are based upon the costs prevailing in March, 1926, and the actual experience of owners of each type of vehicle under all sorts of conditions in different parts of the country. The statistics should therefore be a valuable guide to owners of single vehicles and fleets alike. The tables are issued free on application.

New Automatic Telephone Exchanges.

A Private Installation and Four Post Office Exchange Equipments.

The adoption of the automatic telephone system by the British Post Office authorities as the standard for the State service is prompting progressive manufacturers and industrialists to follow suit and equip their premises with the same system for inter-departmental communication purposes.

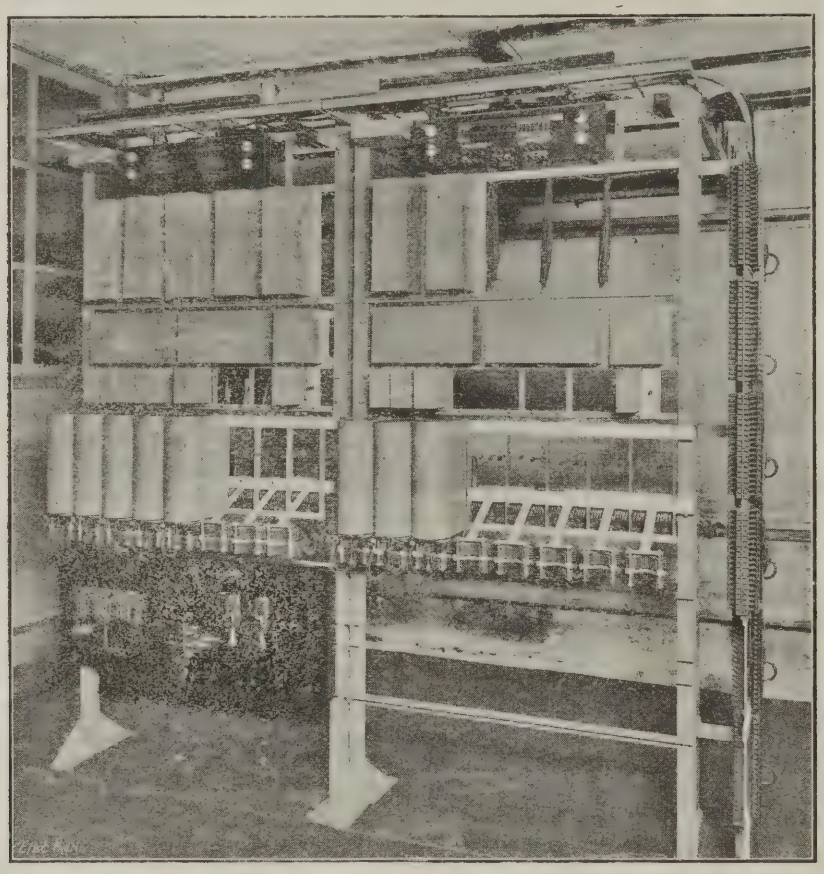

Fig. 1.—A Private Branch Exchange in a Biscuit Factory.

One of the latest concerns to install a Strowger p.a.x. (private automatic exchange) is a well-known firm of biscuit manufacturers, Messrs. W. & R. Jacobs & Co. (Liverpool), Ltd., whose offices, packing rooms, and distributing centre in Liverpool are now served by a 100-line exchange as shown in fig. 1, which was manufactured and installed by the Automatic Telephone Manufacturing Co., Ltd. The immediate capacity of the installation is 67 lines, but provision has been made for an ultimate expansion to the full 100-line capacity, or beyond, should circumstances dictate such growth.

In design, manufacture, and finish, the apparatus is precisely similar to that supplied to the Post Office for public Strowger exchanges. In the functioning of the switches, however, there is a slight difference in principle, it being based on what is known as the "finder" system; each line terminates at the automatic switchboard in a line and cut-off relay, but has no rotary line switch definitely associated with it as in the case of the larger exchanges.

Instead of line switches the rotaries, eight in number, function as "finder switches," their duty being to "find," or select, the particular pair of contacts associated with a calling subscriber's line. Each "finder" controls, or has access to, a corresponding final selector, to which it connects the calling line when it has "found" the calling party's terminals in its own bank of contacts.

Direct current at 50 volts is derived from two Alton storage batteries, each of 25 cells (one being in reserve) and 40 Ah capacity, and provision has been made for charging them alternately through a rheostat from the 230-volt d.c. supply mains. A "Record" cut-in and cut-out controls the charging, an alarm automatically drawing attention to any undue fall in battery voltage.

The present equipment of finder switches and final selectors is eight, enabling a corresponding number of simultaneous conversations to take place. Should the traffic increase, however, there is accommodation for a further eight sets, which would increase the maximum of simultaneous conversations to sixteen, or thirty-two people making use of the system at one and the same time. Refinements include a meter for registering the total number of calls passing through the exchange, and a system of automatic alarm signals indicates any abnormal condition.

The good work of the Post Office Telephone Department in modernising the country's telephone system by periodical additions to, and extensions of, the areas served by the Strowger system continues. The first town to benefit by the change in 1926 is Shrewsbury, the county town of Shropshire, where a 1,000-line automatic exchange was cut into service at the Head Post Office on January 9th.

The equipment, which is of the standard type, comprises nine rotary line-switch units and one p.b.x. unit, which will cater for 1,000 lines, of which approximately 800 are already taken up, but provision has been made for an ultimate expansion to 1,800 lines. The system is four-digit, subscribers' numbers lying 2,000 and 2,999, and the usual special numbers have been allocated.

Associated manual equipment has been provided to enable outer-area subscribers to gain access to Shrewsbury automatic subscribers through the medium of operators who will extend the incoming calls on receipt of verbal instructions in the usual course. The two main batteries (one reserve) are of the Premier Accumulator Co.'s manufacture.

The population of Shrewsbury at the 1921 census was 31,000, so that, even allowing for subsequent growth, the present telephone density of the area (about one telephone to every 40 inhabitants) leaves much to be desired. No doubt the substitution of the automatic system for the slower manual switching of local calls will help to improve this record.

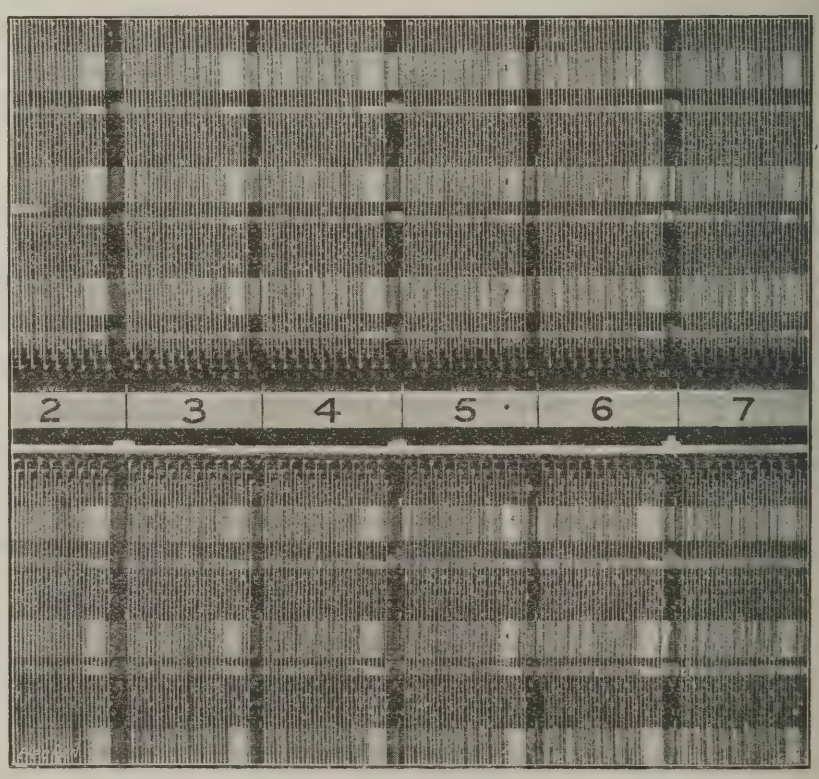

Fig. 2.—Ipswich Exchange; Link Frame Wiring, Selector Trunk Board.

By the completion of two new "satellite" Strowger exchanges at Gosport and Hayling Island, the automatic area of which Portsmouth is the centre has been materially extended. Portsmouth was one of the early towns to enjoy the advantages of a fully automatic service, having been originally equipped in 1916 by the Automatic Telephone Manufacturing Co., Ltd.

Taking post-war growth into account, the present capacity of the main Portsmouth exchange is approximately 5,200 lines. The addition of Gosport and Hayling Island's quota will bring the immediate total of the network up to nearly 6,000 automatic lines, with power to add to that number by virtue of spare equipment available.

Gosport is a Hampshire seaport on the west shore of Portsmouth Harbour, being the site of the Royal Clarence Victualling Yard and Haslar Naval Hospital, and its satelite exchange is equipped for 600 lines, but designed for expansion to 800 lines. The system is four digit, subscribers' numbers lying between 8,000 and 8,599. Switching selector repeaters are employed, their function being threefold: (*a*) To engage trunks for calls to Portsmouth; (*b*) as digit absorbers in the case of local Gosport calls, and (*c*) as repeaters.

Calls to subscribers outside the Portsmouth automatic area are made by dialling "O" when the trunk and junction operator completes the connection on verbal instructions given by the calling subscriber in the usual course; Portsmouth manual operators are retained for this duty. The main batteries are of the Chloride Electric Storage Co.'s manufacture.

Hayling Island, which lies off the coast between Langston and Chichester Harbours, is favoured as a seaside resort and the telephone exchange is a satellite of Portsmouth, the present capacity being 70 subscribers' lines, 70 p.b.x. lines, and three coin-box lines, but there is accommodation for additional lines, or 300 total.

Unlike Gosport, there are no switching selector repeaters at Hayling Island; the group selectors are located in the Portsmouth main exchange, and even local calls proceed *via* trunks to Portsmouth and back again to the Island. Whilst somewhat extravagant in the matter of inter-connecting trunks, involving two pairs for every local connection, this arrangement effects economies in space at the Island exchange and thus has compensating advantages.

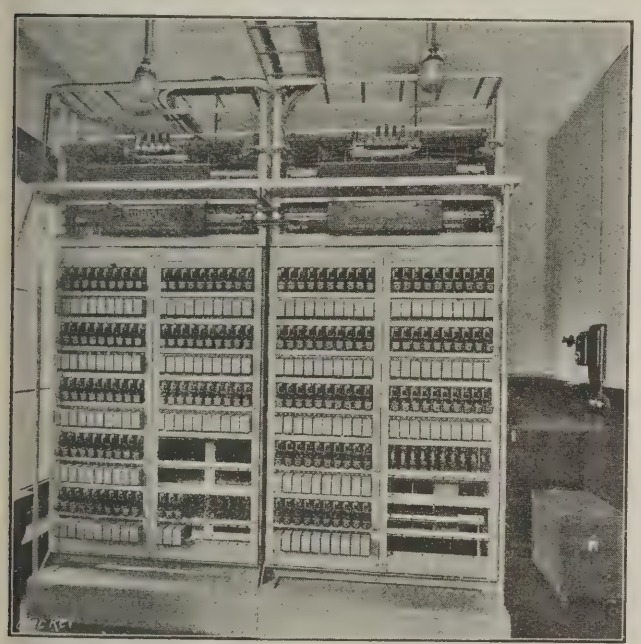

Fig. 3.—Line Switches at Hayling Island Satellite Exchange.

To simplify and centralise maintenance so far as is practicable, certain supervisory features are extended to the Portsmouth exchange. Thus, should the called subscriber fail to replace this receiver at the conclusion of a conversation, the calling subscriber having already cleared in the usual manner, an outgoing repeater will be seized, completing a loop to a first group selector at Portsmouth and a visual lamp signal will be actuated at that exchange, calling attention to the omission. Similarly, the traffic from the Hayling coin-box telephones will be handled directly at Portsmouth.

The population of Gosport, including Alverstoke, at the 1921 census was 33,580, or, allowing for estimated increase, approximately one telephone to every 60 persons. Hayling Island, at the same period, boasted a population of 2,309 souls, or, say, one telephone to every 20 inhabitants, a rather better record than Gosport's, which is probably accounted for by its comparative isolation from Portsmouth.

Both satellite installations were cut into public service on January 13th.

Ipswich, the first town of any magnitude in East Anglia to be converted, is the county town of Suffolk, with a population of 79,371 at the 1921 census. The new A.T.N. (Strowger) equipment has a present capacity for 2,000 lines, of which 1,640 subscribers' and 290 p.b.x. lines are equipped. There are thus 17 regular and 3 p.b.x. rotary line-switch units installed in the switchroom, together with one first group and two second group selector racks and a 2-way repeater rack, with complementary equipment.

The system is 4-digit, subscribers' numbers lying in one of three groups; two groups of numbers have been allocated to p.b.x. lines, and the usual special service numbers have been provided, including one for rural party lines. In addition to a 7-bay rack carrying the usual subscribers' meters, there is a traffic meter rack, a feature of the installation which aptly demonstrates another outstanding advantage of the system. In every telephone area it is the traffic (either estimated or actually determined) which governs such factors as the number of subscribers per operator's position, the number of junctions between two given points, or in the case of A.T.M. (Strowger) equipment, the ratio of group and final selectors to primary rotary line switches, &c. In manual exchanges traffic data are obtained by a "peg count" carried out by the telephonists on duty, and therefore subject to the possibility of error, but the more accurate service of mechanism has been enlisted at Ipswich and elsewhere.

This rack is equipped with four special duty meters, which perform the following functions: The congestion meters automatically indicate the number of times the last choice of a group of trunks is engaged, and thus record the number of lost calls directly due to trunk shortage. Associated with each congestion meter is a traffic unit meter which operates every half minute during the period the congestion meter is energised, thus translating the lost calls into terms of lapsed time. The overflow meter indicates approximately the number of calls rendered ineffective owing to all circuits in a group being engaged, whilst a total traffic record indicates the number of times the switches in any given group are brought into use. To this end a separate meter is provided for each group of switches, and is operated by the release relay belonging to that particular group. Thus this special meter rack ensures the accurate recording of all requisite traffic data, which should prove invaluable to the traffic department. The Post Office is to be congratulated upon the meticulous attention now being devoted to the automatic compilation of guaranteed traffic figures.

At Ipswich batteries of the Premier Accumulator Co.'s manufacture are provided, and the exchange is equipped with complete supervisory and fault-signalling apparatus.

The exchange was cut into service on March 20th last. The telephone density of Ipswich (approximately one to every forty inhabitants) leaves much to be desired. Apart from its local industries, the surrounding country is mainly agricultural and thus lends itself to rural telephone development, and it is anticipated that the introduction of the automatic system will stimulate such development.

Electricity in the Artificial Silk Industry.—A recent "Artificial Silk" number of the *Manchester Guardian Commercial* contains an article by Mr. F. Bunzl Geemen upon the uses of electricity in the artificial silk industry. In the first place the advantages of the electric drive are dealt with, and the author points out that the principal attraction is the elimination of all forms of intermediate gearing, shafting, &c., by the application of the power at the point at which it is required. The design of motors for this class of work is of a very special nature, not only because the electrical and mechanical demands are exceptionally high, but also because all parts have to withstand the attacks of the acids inseparable from the process. This necessitates the choice of special alloys for the various parts of the motor. A further considerable field of utility for electricity in the industry is for the purpose of measurement, regulation, and supervision. There is scarcely another industry in which accurate measurement and supervision of the manufacturing process is of such paramount importance. The possibility of remote measurement is a great advantage. The chemical action of electricity is used in a number of directions, including the recovery of copper from the acid used in the cupro-ammonium process, in "electric bleaching," and in the purification of air charged with sulphurous gases by high-pressure discharges.

Revised B.E.S.A. Publication.—A revised edition of the specification for insulated annealed copper conductors for electric power and light has recently been issued by the British Engineering Standards Association. Few changes were found necessary, although those made are of importance. One extra standard size (0.85 sq. in.) has been added to the list of stranded cables. Tables have been included to cover the thicknesses of vulcanised-bitumen insulated and sheathed cables, and a full list of definitions relating to conductors and cables has also been added. One of the earliest and most effective pieces of standardisation carried out by the electrical industry was in connection with the sizes of electric cables. This work was started in 1899 by the Cable Makers' Association, and at the formation of the Engineering Standards Committee, now the British Engineering Standards Association, a representative committee was appointed to continue this work. The first British standard specification for insulated electric light and power cables was issued in 1904. Copies of the revised Specification, No. 7-1926, may be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, London, S.W.1, price 1s. 3d. each, post free.

Electric Welded Construction.

Some Applications of Electric Arc Welding.

(*Abstract of Paper read before the* Institution of Welding Engineers.)

At a recent meeting of members of the above-named Institution in London, a paper with the above title was presented by Mr. James Caldwell, who stated that to anyone considering the use of arc welding the facts of practical importance were that apparatus and materials were now on the market on a commercial basis, that the general technique of the art had been developed to a practical degree, that trained welders were available in many districts and that, with an increased demand, their number could be easily augmented.

Many tests of various natures had been made to establish standards that would give equal, or better, connection between parts than that obtained by riveting and bolting. Apart from a very large number of tests on structural mild-steel carried out by independent parties in this country, facilities had been provided by the Bureau of Standards at Washington, U.S.A., whilst the railway companies in that country, and especially the Belgian State Railways in Europe, had systematically investigated the possibilities of electric welding for constructional service. In Britain the value of electric welding products and machines was assessed by their ability to successfully meet the requirements of the Admiralty and Lloyd's Register of Shipping, whose comprehensive tests were recognised to satisfy the most stringent requirements of modern practice. Tests had shown that when using mild-steel of the usual structural qualities and flux-coated electrodes of various makes, the ultimate or breaking stress was equal to that of the original material; that the weld metal was generally less ductile than the original mild steel and, necessarily, the reduction of area was also less; that welded joints would not stand bending to the same degree as mild steel; and that it could be reckoned that for alternating stresses welded joints had 70 per cent. of the endurance of the unwelded material, and that butt joints were stronger than lap joints, either welded or rivetted. As regarded impact, Lloyd's tests were two blows from a falling weight of 2 cwt. from a height of 9 ft. on to a ¼-in. welded plate, and two blows of 4 cwt. from a height of 12 ft. on to a ½-inch welded plate to produce no sign of cracking. The performance of these tests disposed of any suspicion that the comparatively low ductility of the weld metal connoted brittleness. Below the elastic limit of the welded material the relation between stress and extension was practically equal to that of the unwelded material, but the most satisfactory and convincing proof of the value of electric-arc welding for constructional services was the success achived in the completion of pioneer undertakings. The durability of such structures was now established (the author stated that he had never known an electrically-welded structure to fail to fulfil the conditions for which it was designed, and the wear and tear of practical use).

After mentioning steam and oil pipe lines, the author said he was not aware of any example of electrically-welded hydraulic pipe line, but the attention which was devoted to the development of water power and the necessity of minimising the capital cost of such works, justified the careful consideration of arc welding as one way of reducing the cost of pipe lines between the reservoirs and power houses. In most cases those pipes had to be laid on mountain slopes over rough ground, and the cost of transport of the pipes and jointing outfit to the site was a heavy one. This element of cost naturally increased with the weight of the individual pieces, and frequently resulted in the choice of a number of small diameter pipes in parallel (although a smaller number of larger pipes would reduce the water friction and the cost of the pipes themselves); by building large pipes *in situ* out of plates cut and curved to shape in the steel works and arc-welded in place, a very great economy was possible. Small petrol-driven sets mounted on trucks could be easily handled and moved as required by the same means of transport as that used for the pipe material, or it might be possible to tap an electric line carried along the route for other purposes.

Transformer cases and tanks were extensively made by electric welding, and the output of one of the large American manufacturers amounted to hundreds per week. As some transformers were mounted on poles and in out-of-door positions, the temperature range due to load was added to by sunshine and weather conditions; in tropical and semi-tropical countries the sunshine heating was often more important than the load heating, and welded tanks endured those conditions quite well. Designs for really large oil tanks (up to 4,000,000 gallons capacity) had been worked out in this country and the U.S.A. Towards the end of 1918 the Admiralty had decided to try welded tanks for this purpose, but the return to peace conditions prevented the completion of the experiment.

A gasholder placed in commission in 1921 at Johannesburg, South Africa, was constructed entirely by means of electric-arc welding; it was of ⅜-in. sheet steel, height 25 ft., capacity 8,000 cu. ft. Much larger structures had been successfully undertaken in Australia; the capacity of the welded gasholder at South Melbourne was 3,000,000 cu. ft., diameter 200 ft., and maximum height 105 ft. The crown sheets and all the side sheets of 9/64-in. thickness were arc welded; there was 15 miles of welding, and when the holder was tested there were no more than six leaks. A similar structure at Fitzroy had a capacity of 3,375,000 cu. ft. with a maximum height of 140 ft.; the erection was completed in 16 weeks by 20 men, 8 welders and 12 helpers. "The Fitzroy gasholder was subjected to rigorous examination, and proved to be, if anything, a more effective piece of construction than the South Melbourne holder, and not a sign of a leak was discerned anywhere."

The use of electric welding for the repair of boilers was well established, but the entire construction of boilers by welding instead of by riveting had not yet gone very far; it was, however, practicable. A welded vertical boiler working at 180 lb. pressure was in use at Uxbridge. Messrs. Hawthorn Leslie, of Newcastle, had built a three-furnace Scotch-type marine boiler with most of the joints welded instead of rivetted, the patented design being known as the Hawthorn-Wyber welded boiler; this boiler, designed for a working pressure of 180 lb., was tested to 360 lb. per sq. in., and proved absolutely tight. After being in use at the makers' works for over a year no trouble had been experienced, and it had been approved by Lloyd's Register, the British Corporation, and the Bureau Veritas.

Steel drums and barrels for the transport of oils and other liquids, and wheels for motor vehicles, were included in references to many applications of electric-arc welding, and, finally, numerous cases in which it had been used for general structural work were quoted. Experience proved, said the author, that the adoption of electric welding saved time, labour, and materials, as compared with riveted joints; the design of members and parts was simplified, and stock sections could be utilised to build into stanchions, gantries, roof trusses, &c., in ways which would be impracticable if riveting were employed. Extensive practice had shown that the best conditions resulted from the use of flux-covered electrodes; also the flux covering had an important influence on the composition of the deposited metal. By a proper combination of electrode and flux composition it was possible to make welds of a great variety of ferrous metals in which the deposited weld metal would match in composition and structure the material joined. That could not be ensured by merely making the electrode metal match the work, as their composition was changed in passing through the arc; the co-operation of fluxes seemed to be essential.

Discussion.

Mr. A. E. Plumstead pointed out that in one part of the paper tensile strength of lap joints was said to be from 70 to 85 per cent. of the breaking stress of the plain plate, whilst in another part the tensile strength of lap joints was said to be 100 per cent. Referring to the statement that double-filleted lap joints generally broke across the solid plate on the edge of one of the fillets at a stress of from 70 to 85 per cent. of the breaking stress of the plain plate, and that single-filleted lap joints generally broke in two stages, the closing run first failing, after which the full fillet yielded, he said that in his view the first weld was not so strong as a butt weld, and in the case of the second a construction strain was set up during the welding which caused the lap weld to be weaker than a butt weld; in fact, it was stated in the paper that the breaking stress of a butt weld was equal to that of the original material. The American standard for tanks to withstand a pressure of from 30 to 100 lb. per sq. in. was that the welded joints must be equal to 50 per cent. of the tensile strength of the plate, which equalled 48,000 lb. per sq. in., so that he was unable to reconcile the author's figures with those. He had constructed a good many articles manufactured from ¼-in. plate, and had had difficulty in getting a neat weld; he had found it necessary to tack-weld tanks in some instances, and to run over them in order to secure water-tightness, but rather unsightly lumps were produced on the weld. He had had to repair a gasholder of a capacity of 800,000 cu. ft.; plates and rivet seams were badly corroded, and he had had to weld 120 new plates, varying in size from 4 to 6 ft. square, roughly, over the old plates, whilst the gasholder was actually in use. When the repairs were commenced the operators were rather nervous and there were big leakages to contend with, but the job was a great success.

Mr. E. MacGrath considered that a pressure of 50 lb. was very small to produce leaks in a tank 6 ft. by 3 ft. by 3 ft., made of ⅜-in. mild steel plate, even with riveted seams.

Mr. F. E. Saunders, referring to the author's statement that in Britain the value of electric welding products and machines was assessed by their ability successfully to meet the requirements of the Admiralty and Lloyd's Register of Shipping, asked whether that statement referred to plants or to electrodes. If the latter, what protection had the consumer that the same electrodes would be used, and that the electrodes used would be passed by Lloyd's?

Mr. W. J. Keith asked whether, in the event of pipe lines being welded electrically, electrolytic action might be expected in the course of time. He had been asked that question by a contractor abroad some time ago, but he had been unable to find any information on the subject in welding literature.

Mr. A. C. Brown asked if the author could give any information as to the magnetic inductance through a welded joint. There was a fairly large field for welding in the making of electrical instruments and small things of that nature, but the problem of magnetic conductivity would have to be taken into account.

The Chairman (Mr. A. L. Haggerty) suggested that the paper did not go far enough in some directions. It contained a somewhat remarkable list of the applications of electric welding, but it was surprising, even to those who were familiar with the subject, how large was the number of applications which had already been employed. It had to be borne in mind that electric welding was, to a large extent, competing with practices which were already well established, and he suggested that it was not sufficient to show that electric welding could do what had already been done by other processes; it had to be shown that it was better, and also that it was cheaper, particularly the latter. There was a general opinion among engineers, he believed, that electric arc welding was an expensive process, and it was probable that the experimental jobs which had been illustrated were extremely expensive. At the same time, there were probably many who could testify that electric welding when applied to other structures was a very much cheaper process than riveting.

Mr. A. J. Hoare, who replied in the absence of the author, did not attempt to make a full reply to the questions which had been asked, but with regard to lap welds, said he believed that Major Caldwell referred in the paper to the figures which were obtained by Sir Westcott Abell, who, acting on behalf of "Lloyd's Register of Shipping," had carried out tests at Messrs. Cammell, Laird & Co.'s works at Birkenhead in 1918. Personally, he did not think that ⅛-in. plate welding could be done so neatly with the electric arc as with acetylene. The main advantage of electrically welding ⅛-in. plate was the fact that the sheets could be welded without buckling. As to the machining of the pinion which had been built up by the electrical method, there was no difficulty in machining welded cast steel; difficulty had been encountered in machining welded cast iron, however. He was not aware that the question of electrolytic action on electrically-welded pipe lines had been raised before. The only instance he knew of in which electrolytic action had taken place was in ships' hulls, where the deposited metal stood quite as well as the previous metal did.

As to the utilisation of electric welding for the manufacture of electromagnets, he considered that the conductivity would be sufficiently good, provided the weld was made properly and the metal was absolutely solid, but if the welding were carried out in such a way that there were slag inclusions in the weld, it would reduce the conductivity of the metal.

New Japanese Customs Tariff.

The revised list of import duties put into force by the Japanese Government on March 29th was issued as a supplement to the *Board of Trade Journal* dated April 15th. It is stated that the primary object of the revision is not to raise additional revenue, although increased returns are anticipated, but to protect a number of native industries. From the new tariff we reproduce below a number of electrical and allied items. Except where otherwise stated the duty is given in yen per 100 kin (132,277 lb.); the abbreviation *a.v.* denotes an *ad valorem* percentage:—

Tariff No.	Description.	Rate of duty.
321.	Insulating tapes of tissues	23.70
419.	Sheet mica	free
419.	Sheet mica, glued together	38.10
464.	Copper wires, not exceeding 0.5 mm. dia.	19.30
	Copper wires, exceeding 0.5 mm. dia.	20.40
486.	Insulated electric wires—	
	Submarine teleg. or teleph. cables (armoured)	free
	Other armoured cables combined with india-rubber or gutta-percha	20.00
	Other armoured cables for telephone or telegraphic use	5.50
	Other armoured cables for other purposes	11.20
	Flexible cords combined with silk	25 *a.v.*
	Flexible cords, other	18.00
	Unarmoured cables combined with india-rubber or gutta-percha	26.00
	Unarmoured cables, other	25 *a.v.*
515.	Electric stoves, irons and similar utensils	35 *a.v.*
528.	(2) Electric clocks (master and subsidiary)	35 *a.v.*
543.	Ammeters, voltmeters, and volt-ampere meters	148.00
544.	Wattmeters	20 *a.v.*
	Watt-hour meters	52.30
547.	Accumulators	20 *a.v.*
	Dry batteries	17.30
	Other batteries	25 *a.v.*
	Battery electrodes	20 *a.v.*
	Other parts	25 *a.v.*
569.	Steam boilers, cast-iron	5.00
	Steam boilers, other	8.00
571.	Mechanical stokers	6.10
571.	(2) Fuel economisers	3.35
572.	Feed-water heaters	12.80
577.	Gas engines, weighing not more than 250 kg.	23.10
	Ranging to engines weighing not more than 50,000 kg.	8.2
	Other gas engines	20 *a.v.*
578.	Water turbines and Pelton wheels, weighing not more than 5,000 kg.	20 *a.v.*
	Ditto, weighing not more than 10,000 kg.	15.20
	Ditto, other	14.90
579.	Dynamos, electric motors, rotary converters, frequency changers, rotary phase converters and armatures—	
	Weighing not more than 25 kg.	42.40
	Ranging to machines weighing more than 5,000 kg.	15.80
579.	(2) Transformers weighing not more than 25 kg.	26.00
	Ranging to transformers weighing more than 5,000 kg.	7.00
580.	Dynamos combined with motive machinery	20 *a.v.*
618.	Filaments for incandescent lamps	20 *a.v.*
619.	Carbon for electrical use, powder or grain	8.30
	Carbons, each weighing not more than 300 grammes	20 *a.v.*
	Ditto, weighing more than 300 grammes	8.30
631.	Vulcanised fibres (not embossed)	17.80
635.	Incandescent electric lamps	12.80
	Chandeliers, brackets, shades, &c.	40 *a.v.*

The Contractors' Conference at Brighton.

We have already briefly announced in the Electrical Review that the First Annual Conference of the E.C.A. Allied Associations (The Electrical Contractors' Association, Incorporated, the N.E.C.T.A., Ltd., and the National Federated Electrical Association) will be held at the Royal Pavilion, Brighton, on Thursday and Friday, June 24th and 25th. We have now received particulars of the full programme of events which has been arranged for these days and for the 23rd and 26th as well. These are as follows:—

Wednesday, June 23rd.

10 a.m.—Meeting of the Council of the Three Associations.
6.10 p.m.—Arrival of Delegates and Registration at the Royal Pavilion.
7.30 p.m.—Reception by the President, Mr. T. E. Alger, A.M.I.E.E., at the Royal Pavilion; music, dancing, light refreshments.

Thursday, June 24th.

10 a.m.—Opening of Conference; address of welcome by His Worship the Lord Mayor of Brighton, Councillor J. Lord Thompson, J.P., and reply by the President.
10.15 a.m.—Presidential address by Mr. T. E. Alger.
11.30 a.m.—Annual General Meeting.
1 p.m.—Luncheon adjournment.
2.30 p.m.—Paper by Mr. Walter Finlay, W.S. secretary of the E.C.A. of Scotland, on "Co-operation Between the Supply and Contracting Sections of the Industry."
3 p.m.—Discussion.
4 p.m.—Paper by Mr. Walter Riggs, A.M.I.E.E., past-president, E.C.A. Allied Associations, on "Apprenticeship."
4.30 p.m.—Discussion.
5.30 p.m.—Conference adjourns.
7.30 p.m.—Smoking concert in the Music Room, Royal Pavilion.

Friday, June 25th.

10 a.m.—Discussion initiated by Mr. Llewellyn B. Atkinson, M.I.E.E., director, Cable-Makers' Association, on "The Need for a Standard Set of Wiring Rules to be Applied Nationally."
11 a.m.—Paper by Mr. F. W. Purse, M.I.E.E., engineer and manager, West Ham Corporation, on "The Registration of Electrical Contractors."
12.30 p.m.—Votes of thanks, and brief address by the President-Elect, Mr. H. J. Miles M.I.E.E.
1.15 p.m.—Close of business session.
3 p.m.—Garden party in grounds of Royal Pavilion.
9 p.m.—Ball at Royal Pavilion by invitation of His Worship the Mayor of Brighton.

Saturday, June 26th.

Arrangements for golf, drives, &c., have been made for those who desire to spend the week-end in Brighton.

Arrangements under the usual conditions have been made to secure reduced railway rates on vouchers signed by the Conference Secretary. Comprehensive hotel arrangements have also been made, full details of which, together with copies of the Conference programme and other literature may be obtained from the Conference Secretary, Mr. H. J. Galliers, at 32, St. James's Street, Brighton, to whom all general correspondence relating to the Conference should be addressed.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

New "Osram" Valves and Pins.

The General Electric Co., Ltd., has recently produced a new 2-V thermionic valve of the dull-emitter type (the "D.E.2"), in two patterns—for high- and low-frequency. Their filament current being 0.12A, these valves mark the half-way point between the dull-emitters proper, consuming 0.06 A, and the semi-dull-emitters, which take from 0.2 to 0.3 A. The potential which the filament will safely withstand is the full two volts, so that when a 2-V accumulator is used a low-resistance rheostat is sufficient. The h.f. type was found to operate satisfactorily as an amplifier (requiring from 40 to 50 V on the anode), and as a detector with a similar plate voltage. The l.f. valve gave satisfactory results as an amplifier, with a 3 to 1 transformer coupling, with between 60 and 70 V on the plate and a grid bias of —3 V. When resistance and choke coupled audio-frequency amplifiers are used the h.f. valve will be found suitable. The amplification factor of the h.f. valve is 12 and the impedance 45,000 ohms. The equivalent figures for the l.f. pattern are 7 and 22,000 ohms. The valve is illustrated in fig. 1.

Valve pins, even the best, have at times proved faulty in consequence of their form. The split type of pin hitherto universally used provides good contact in the early stages of its life, but invariably relaxes in time, and the usual course adopted to remedy this defect is to open the pins with a knife; not only does this weaken them, but in many cases

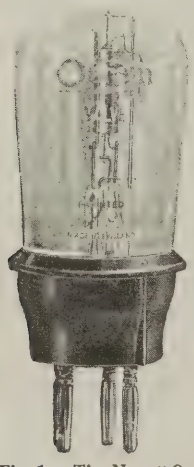

Fig. 1.—The New "Osram" D E.2 Valve.

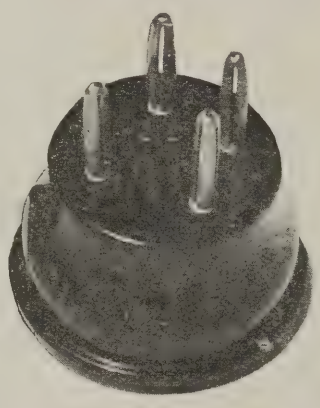

Fig. 2.—Hollow Cross-cut Valve Pins.

recourse to this measure has meant the snapping of one half of the pin. A new type of pin, fig. 2, has been evolved by the General Electric Co., Ltd., which will shortly be fitted to all "Osram" valves; the above-mentioned D.E.2 types, in fact, are already being supplied fitted with this form of contact, which might best be described as the "hollow cross-cut pin." It consists of a turned brass pin, slightly convex in shape, with a hole bored through it longitudinally; in addition, two fine longitudinal sawcuts, made at right angles, give a spring effect to the pin. The sawcuts do not extend to the tip, and thus impart resiliency without weakening. The lead-out wire from the valve is brought through the centre of the pin and soldered to it at the tip, leaving no flux or other obstruction on the base to reduce insulation between pins; this allows the valve to be pushed right home in the socket, the base lying flush with the panel. The base itself of every "Osram" receiving valve in now composed entirely of a high-grade insulating material which reduces capacity effects between the electrodes and is neat in appearance, the flange for lifting the valve and the ridge for indicating the anode pin being well-known features.

An Unusual Crystal Detector.

The adjustment of a point in contact with a surface, such as a crystal detector, requires mechanism capable of the smallest movement and the contact point should be held firmly and be of a rigid character instead of the usual springy nature. It was with such objects as these that Messrs. S. A. Lamplugh, Ltd., patented their detector, which is illustrated in fig. 3. The glass dome is held in position and sealed with a rubber ring, and only needs to be pressed in or pulled out. The universal movement enables nearly the whole of the crystal surface to be searched, and it is claimed that as little as 1/100,000th part of an inch movement of the contact is possible. So precise is the simple mechanism that the contact may be withdrawn and again advanced to the identical position at will. In addition to its handsome appearance, the usual facilities for selecting the best spot and ease of access to both crystal and contact will be appreciated.

This detector is mounted on an insulated base and holes are provided at the four corners for fixing the component to a baseboard or panel. At one end two telephone terminals are mounted, and at the other the base is moulded with a projection, and drilled with two holes through which a stiff vertical U-shaped piece of wire passes. The bottom of the U projects into a longitudinal channel cut in the underside of the base, and a cross-piece slide fits over the two vertical legs.

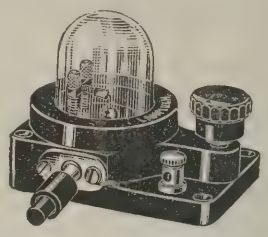

Fig. 3.—The Lamplugh Detector.

Two milled nuts screw on the ends of the legs, and hold the cross-piece in position against two springs, slipped one over each leg. A horizontal split screw in the middle of the cross-piece grips a spear-pointed wire bent vertically downwards to act as a cat's whisker. One end of a plated-metal strip passes between the bend in the U-shaped wire and the underside of the base, while a screw rotated by a knob of insulating material passes through a nut and presses on the other end of the metal strip. This combination acts as a lever with about a six to one ratio, so that an exceedingly fine control of the vertical motion of the cat's whisker is ensured.

The crystal is gripped in a pair of spring tongs moving in a metal sleeve through one side of the base. By pressing a small black knob the jaws of the tongs are opened, and with the aid of the ball-socket mounting it is possible to pick up crystals from the base, and also to obtain coarse adjustment of the contact with the whisker.

A Terminal "De Luxe."

Amongst the little things that count when utility is to be combined with elegance are the insulated terminals made by Messrs. Belling & Lee, Ltd. As indicated in fig. 4, the screw-action insulated head has a non-rotating engraved top; the stem and cross-hole facilitate connection and shielded metal clamping faces are provided. Below the insulating collar are a standard 2 B.A. stem with a nut and washer, and the transverse slot and clamping nut at the end eliminate soldering. The insulation material used is polished black

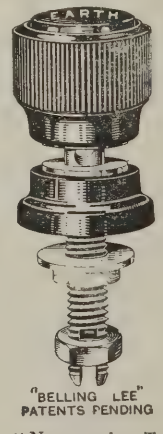

Fig. 4.—The "Non-rotating Top" Terminal.

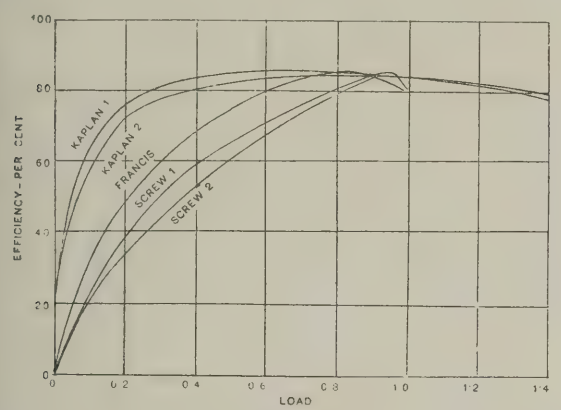
Bakelite, and all metal parts are nickelled. Besides wireless circles, this well-made component should be serviceable to instrument makers and others in the electrical trade. Other patterns of terminal are also made, and also wire couplers and plugs and sockets, which are provided with an internal chuck grip, and present a neat appearance.



Radio Section at Padua Sample Fair.—The Department of Overseas Trade is informed that a special section for the display of radio-technical instruments is to be organised at the Sample Fair at Padua, which is to be held from June 5th to 20th. Prizes will be offered for the best types of apparatus based on the principles of least cost and highest efficiency. The competition is open to manufacturers of all nations.—*Board of Trade Journal.*

The Kaplan Hydraulic Turbine.

Its Advantages over the Francis and Propeller Types.

In a recent issue of the *Revue Générale de l'Electricité*, Mr. E. Luthy, the chief engineer of the Water Power Department of the Société des Constructions Electriques de France, gives an instructive summary of the tests of various types of turbines for hydro-electric stations carried out by Mr. Elov Englesson, the chief engineer of the Aktiebolag Karlstads Verkstaden, of Kristinehamn, Sweden, and the following notes, based on the summary, may prove of interest.

The Kaplan turbine, while of the screw-propeller type, differs from the usual design in that the blades are capable of having their angle of inclination varied while running, an arrangement which results in several advantages from the operation point of view; but, on the other hand, the blade-adjusting mechanism renders the machine more complicated than an ordinary propeller turbine. It was therefore important to devise a method of blade adjustment control which, while

Kaplan 1, specific speed, 600; Kaplan 2, sp. speed 750. Francis, sp. speed 350. Screw 1, sp. speed 500; Screw 2, sp. speed 600.

Fig. 1.—Variation of Efficiency with Varying Load of Kaplan, Francis, and Propeller (Screw) Turbines, under Constant Head.

maintaining the automaticity of the blade-angle variation, should be as simple as possible. It is to this matter that Englesson has devoted considerable attention, the result of his labours being seen in an arrangement he has patented and which has been applied to an 11,200-h.p. turbine, with a blade diameter of 5.8 metres (19 ft.), built for a water head of 21 ft. 3 in., at the Swedish State power station at Lilla Edet. The problem is solved by the introduction, in the interior of the hub, of a servo-motor on which the real automatic controller acts through the intermediary of a valve. The hub is filled with oil, ensuring the lubrication of all the bearings, an oil-tight ring preventing the escape of any of the oil. In practice it has been found that Kaplan turbines constructed in this way show very little variation in efficiency when running with either low or normal water admissions.

Determining the Maximum Suction Head.

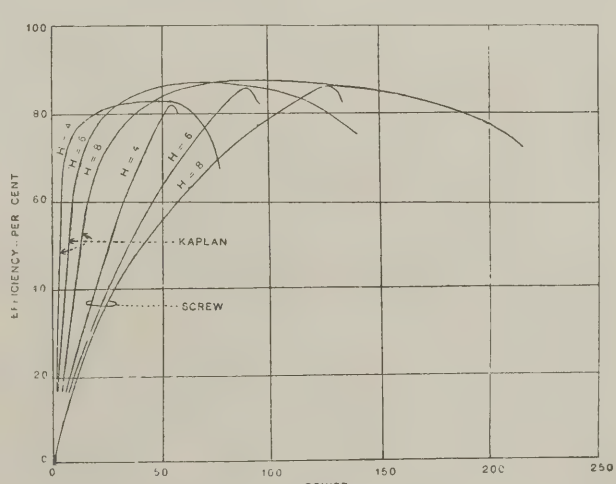
In determining the admissible suction head of turbines, one of the problems to be kept in mind is that when the suction exceeds a certain value, what may be termed "cavitations" are formed, which give rise to a falling-off in efficiency. By cavitation is meant the free space which is established between the surface of the blades and that of the film of water, which instead of following the contour of the blade tends to leave it. These spaces become filled with water vapour and oxygenated air, a mixture which rapidly causes blade corrosion. Cavitations are caused as soon as the vacuum on the blades attains the pressure of water vaporisation.

The maximum suction head depends, therefore, on the conditions of cavitation formation, the essential elements of which are dealt with below.

(1) The height of static suction is equal to the difference between the level of the moving wheel and that of the tail-race. The risk of cavitation increases with the height of suction, it being due to the desire to keep these heights as low as possible that vertical-shaft turbines are preferred.

(2) The axial speed at the delivery end of the moving propeller being designated by c, and that of the outlet of the siphon by c_2, the kinetic height recuperated in the suction pipe is $\eta(c_2^2-c_3^2)/2g$, η being the efficiency of the siphon. The vacuum on the outlet side of the propeller increases in the same degree as the recuperated kinetic height. It follows therefore that the vacuum, and the risk of cavitation, increases with the height, correspondingly to the outlet speed to be recuperated in the siphon. In the propeller type of turbine, the height corresponding to the permitted outlet speed varies between 20 and 30 per cent. of the total available head. It is comprised between the same limits in the case of Kaplan turbines working under normal load, and reaches as much as 70 per cent. of the total head when running at an overload.

Where a high head has to be taken into consideration, the lower values indicated above must be adopted, if the limit of cavitation is not to be exceeded. In this case, the propellers have to be relatively large.



(3) As regards the length of the blades in relation to the pitch, when the turbines are intended to run at a high speed, it is necessary, in order to reduce the friction, to employ small-surface blades, that is to say, blades which are short in proportion to the pitch. This results in an increase in the specific pressure on the blades—an increasing danger of cavitation. It is to avoid these disadvantages that it is necessary for the blades to be made larger, when the height of fall and of suction are themselves greater and to adopt lower values for the specific speed.

In the Kaplan turbines so far tested, the largest blades are slightly longer than the pitch.

As the creation of cavitation also depends on a certain number of other factors, such as the temperature of the water, the profile of the blades, the circumferential speed, &c., it is almost an impossibility exactly to determine the entire conditions which give rise to cavitation. All that can be done is to approximately determine the effect of each of the factors which enter into the problem, and to determine experimentally the permissible suction heights for differing heights of fall and circumferential speeds. To enable this to be done a laboratory has been established at the Karlstad Company's works at Kristinehamn, in which turbines with a propeller diameter up to 250 mm. (9¾ in.) can be tested with any degree of suction height, positive or negative, under water heads ranging from 1 to 11 metres (3 to 36 ft.). The conditions giving rise to cavitation can thus be determined either by brake tests, or, with the turbine in operation, by a stroboscopical method by which the formation of cavitations on the propeller can be directly observed. Plant for similar experiments has also been established by the Czecho-Slovakian firm of Ignaz Storek, and at the Polytechnic School at Munich.

In determining the maximum permissible head of water there is, in addition to questions relative to cavitation, another matter to be taken into consideration—that of the solidity of the rotating propeller. Although, even for fairly large heads, one-piece rotors in propeller-type turbines can frequently be adopted, this is not possible in Kaplan turbines, the blades of which must be pivotally connected to the hub, which therefore in the case of relatively great heads must be of a correspondingly large diameter. So long as the head of water does not exceed 15 metres (50 ft.), the diameter of the hub is not excessive. It is possible without any drawbacks as regards the solidity of the rotor, to employ Kaplan turbines for a water head double that just mentioned, although in such a case the hub assumes rather a large size.

So far Kaplan turbines have only been employed in installations where the head does not exceed 17 metres (56 ft.). The

Speed, 637 r.p.m.; diameter of rotor, 600 mm.

Fig. 2.—Variation of Efficiency with Load of Kaplan and Screw Turbines, for Different Heads.

latter condition obtains at the Wiesenberg power station in Czecho-Slovakia, where there is at work a Storek 300-h.p. horizontal-spindle turbine of the Kaplan type running at 1,000 r.p.m.

The Specific Speed.

In installations where the height of head is low, Kaplan turbines can be run at a higher specific speed than those of the propeller type and still maintain their efficiency, this being rendered possible by a form of non-overlapping blade made in accordance with one of Englesson's main patents. The blades are of course short and as the losses due to friction are re-

duced, the permissible circumferential speed attains a high value.

It is obviously possible to provide propeller-type turbines with non-overlapping blades and to attain equally high specific speeds as with Kaplans. Such a turbine, however, would have a low efficiency at all the varying loads, while that of Kaplans only falls off at maximum load and maximum speed, conditions which are rarely met with, and even when they occur, the question of efficiency is not of great importance. Kaplan turbines have been constructed with specific speeds of over 1,000 r.p.m. for heads of 16½ ft. As the head becomes greater, it is necessary to reduce the specific speed, 600 r.p.m. never being exceeded for a head of 50 ft.

One of the greatest advantages of Kaplan turbines over those of a comparable type such as high-speed propeller and Francis turbines, lies in the slight variation in efficiency under differing

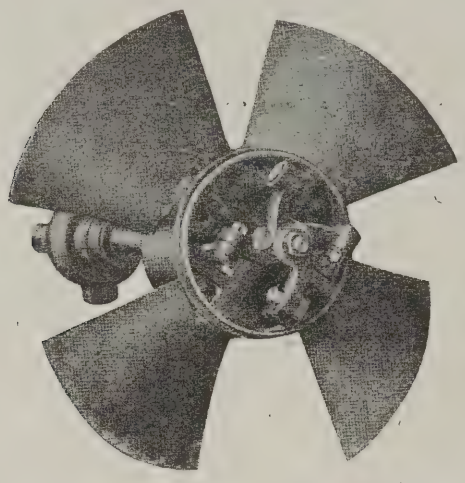


Fig. 3.—Rotor of Kaplan Turbine, with Hub Cover Removed.

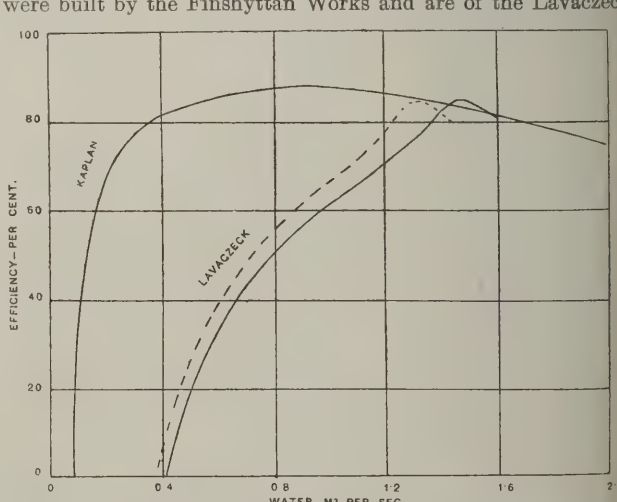
loads, this arising from the use of adjustable blades. Fig. 1 is a diagram showing the efficiency curves obtained from tests of two Kaplans, two propeller-type and a Francis turbine at the Karlstad Co.'s laboratory, the diameter of the propellers in all five machines being 600 mm. (23½ in.), the suction pipe elbow through which the horizontal shaft of the turbines extended being also the same in all cases. It will be gathered that the efficiencies of the propeller-type turbines, and more especially of the Kaplans, are closely related to the shape and dimensions of the suction pipe, in which is recuperated, when running at normal load, power which may amount to 30 per cent. of the power of the total head. Englesson admits that the results of the tests at Kristinehamn with propeller-type turbines are not quite so good as those published by several German and Swiss concerns, which, however, conducted their tests with long, straight pipes, but as these are rarely met with in practice they were not employed in the Swedish tests.

Where water under a variable head has to be dealt with, Kaplan turbines, it is claimed, offer a distinct advantage as regards efficiency over propeller-type turbines, owing to the reduction in power development due to lower heads being less. This claim is supported by fig. 2, which shows the comparative curves of efficiency variation under different heads obtained in the course of tests with a Kaplan and a propeller turbine, the propeller diameter of which was approximately 23.6 in. It may be noted that the available minimum delivery corresponds generally to the maximum height of head. In the case of propeller-type turbines, it is therefore necessary that they should be run under conditions which will enable maximum efficiency to be secured and also that the water delivery is sufficient to permit this *réqime* to be attained. These difficult problems are not experienced in connection with Kaplan turbines, the efficiency of which varies but slightly under different heads or varying amounts of water delivery, the type possessing under these headings important advantages.

Tests have also been carried out as to economy in water consumption for a given power development which can be effected by the use of Kaplans as against the propeller or Francis types. A summary of the results showing the economy in percentages is given in the subjoined table :—

No. of Sets in parallel.	Economy per cent. over Propeller Turbines.	Economy per cent. over Francis Turbines.
1	38	22
2	29	15
3	20	8
4	13	4
5	7	2



The variations indicated by the table are mainly due to the fact that an electric power station is rarely run at full load, that is at a load corresponding to maximum efficiency as regards the major number of machines. In view of the fact that a much higher specific speed is possible with Kaplans than with the propeller type and more than double that attainable by Francis turbines, it is possible to effect a reduction in the cost of alternators for any particular hydro-electric plant. Moreover, despite the high specific speed, the efficiency within very wide load variation limits is quite satisfactory, so that it is possible to reduce the number of generating sets necessary to give a certain output and so effect an economy in both the first cost and the cost of running an installation.

Another great advantage of the Kaplan turbine is that it may be run at a 50 per cent. overload without any serious diminution in efficiency. This advantage is particularly useful in case of breakdown or temporary stoppage of one of the generating sets in a power station as the remaining sets can be run temporarily at a higher load without any inconvenience or danger. Indeed, it is possible in this way to render the need for a reserve generating set unnecessary.

As it is admitted that Kaplan turbines, being fitted with adjustable blades, are more complicated than propeller turbines, it may be held that this is an undesirable factor in that it may give rise to unreliable station running. It is claimed, however, that the methods of blade angle variation that are now adopted, and the results obtained in actual practice, are such that Kaplan turbines are, from the reliability point of view, comparable with those of the fixed blade type, all reaction stresses due to the blade angle variation being taken up in the blade boss itself, so that the turbine shaft and pivot are unaffected.

As regards the question of cost, Kaplan turbines, in view of the advantages they offer, are of course more expensive to build than either the propeller or Francis types. The difference in cost between the Kaplan and the other types, however, falls proportionately as the size of the turbines is increased. Thus, whereas to develop equal power a Kaplan with a movable-blade propeller diameter of 1 metre (3¼ ft.) is 50 per cent. more costly than one of the other types, the difference falls to 15 per cent. in the case of a Kaplan with a propeller diameter of 6 metres (20 ft.). If only equal propeller diameter is taken into consideration, the difference in cost is greater, amounting to 75 per cent. for a 1-metre propeller Kaplan and 30 per cent. for one of 6 metres diameter. In considering the merits of Kaplan turbines, however, it is not so much their individual cost that has to be regarded as the relation of such cost to the total expenditure on the power plant. Figures drawn up a few years ago for the Swedish Government by the Svenska Commerskollegiet show that the average value of the cost of turbines was only 0.1 of the total cost of the plant in the case of working heads of 5 and 6 metres (16½ and 20 ft.) and that the turbine cost falls to 0.06 of the total outlay on plants where the available head of water is 10 metres (33 ft.). Thus, in the case of a plant with a head of 6 metres, and accepting that a Kaplan would cost 50 per cent. more than a propeller-type machine, the increase in the total cost of the station would only be 5 per cent., which it is claimed would be more than counterbalanced by the increased power output, which is much more than 5 per cent. above that of the ordinary propeller turbine. Moreover, owing to the higher speed of the Kaplan, a less costly alternator can, as has already been pointed out, be used, so that in the aggregate, a set consisting of a Kaplan turbine and generator need be no more costly than a propeller-type turbo-generating set. Fig. 3 shows a Kaplan propeller with the hub cover removed.

Swedish Export for April gives some particulars of the water-power station at Lilla Edet, belonging to the Swedish Government. The mean head is only about 21 ft., but the quantity of water is considerable, some 35,000 cu. ft. a second. The present installation is planned for about 15,000 cu. ft. Three turbines are installed, all of the vertical type and at mean head of approximately 10,000 h.p. capacity each. Two of them were built by the Finshyttan Works and are of the Lavaczeck

Model runners; Kaplan 950 mm. diam., Lavaczeck 950 mm. (dotted), 1,000 mm. (firm). Water reduced to 1 m. head.

Fig. 4.—Efficiency Curves of Kaplan and Lavaczeck Turbines.

type. The runners are 19 ft. 7½ in. in diameter, and are said to be the largest yet built. The most interesting set, however, is the third turbine, built by Verkstaden in Kristinehamn; this is the largest of its kind yet built. The runner of this turbine weighs 62½ tons as compared with 46 tons in the case of the other runners. The guaranteed output at a head of 6.5 m. and 62½ r.p.m was 11,200 h.p. In the hub of the runner are automatic devices for setting the runner blades at different angles according to the load. At the guaranteed maximum load the turbine handles 160 tons of water per second, but it has proved capable on overload of using 200 tons per second.

Each of the turbines drives an Asea alternator of about 10,000 h.p. The weight supported by the cross bearing of each generator is 440 tons.

The first trial run was made on December 19th. The head was at that time at minimum height, 5.6 m., for which the works had guaranteed an output of 9,200 h.p. The turbine actually developed 11,560 h.p., or more than the guaranteed maximum at 6.5 m. head; it may be expected to develop upwards of 15,000 h.p. at the normal head of 6.5 metres. Test results with model turbines give an efficiency of 89 per cent. for the Kaplan and 85 per cent. for the other type (see fig. 4), and it is estimated that the actual figure for the big Kaplan turbine will be well over 90 per cent. in actual working. The Kaplan turbine has now been running since January 7th, the power being transmitted to Trollhättan.

Before the present installation only small Kaplan turbines had been at work in Sweden. A 400-h.p. set built by the Kristinehamn Works for the city of Gävle electricity works has been running about four years, and the fact that another turbine of the same type and of 700 h.p. capacity has just been ordered is sufficient evidence that it has fulfilled the expectations of the designers. The engineer reports that at the low water prevailing, which could hardly keep another propeller turbine running with no load, the 400-h.p. Kaplan turbine developed 200 h.p.

Reviews.

The Enlarged Heat Drop Tables, H.p. Gauge Pressures, L.p. Absolute Pressures. London: Edward Arnold and Co. Price 10s. 6d. net.

The tables contained in this book are based on the system of equations formulated by Professor H. L. Callender, M.A., and have been calculated by Herbert Moss, D.Sc., and published for the Turbine Section of the British Electrical and Allied Industries Research Association. The tables are arranged in two sections—conversion tables for initial and final pressures, and temperatures, and adiabatic heat drops in B.th.u. per lb. of steam. The latter is arranged in 36 tables indexed under the final pressures, in inches of mercury vacuum, from 27.0 to 29.5 inclusive. Each table gives the saturation temperature, and the initial superheat values of from 0 deg. (saturated) to 300 deg. for 29 initial gauge pressures ranging from 2,000 to 400 lb. per sq. in. inclusive.

Electric Vehicles. By Charles W. Marshall, B.Sc. Pp. xii + 96; figs. 43. London: Chapman & Hall, Ltd. Price, 9s. 6d. net.

Electrical engineers and those on the commercial side of electrical exploitation have not up to now given to the subject of accumulator road traction the attention and effort its importance warrants. This attitude of apathy may partially be explained if not excused by the calls made on the active personnel of the industry by the rapid advances which have occurred in every branch of recent years, leaving the tired brain with little or no inclination to study that which can without inconvenience be left for some other occasion. Thus it happens that the majority of electrical men know far less about electric vehicles than would have been expected, since transport technique in all its branches exerts as a rule something akin to fascination even on the technically uninstructed mind.

And now Mr. Marshall comes along and presents a compact little volume on electric vehicles which is a model of condensation and yet which deals with salient principles in a scientific manner, devoid of loose generalisation and calculated to enable anyone within the space of an evening's reading to glean a foundational knowledge of this subject.

The treatment very rightly begins with a discussion of the factors governing traction on common roads, from a study of which it will be apparent how applicable is the electrical method of measurement to vehicle performance generally, a fact which automobile engineers, apart from those engaged in accumulator vehicle work, might profit by and reduce their units of measurement to a rational basis in lieu of their "miles per gallon" basis which expresses so badly because so indefinitely the merits of their products. To illustrate the point, a good electric vehicle running at 12 m.p.h. on a hard road (level) will dissipate 90 watt-hours of battery output per gross ton-mile (g.t.m.). A good petrol lorry under similar conditions will consume petrol at the rate of 60 g.t.m. per gallon, which, assuming 19,000 B.th.u. per lb., or say 136,000 B.th.u. per gallon, would entail 2,265 B.th.u. per g.t.m., which converted into electrical units is equal to 633 Wh. In other words, 543 watt-hours per g.t.m. disappear in engine losses in such a vehicle. Remembering that many cars give a performance of only 20 g.t.m. per gallon of fuel it will be appreciated what an immense scope for improvement in fuel energy conversion and utilisation awaits the engineers who design these machines. Prof. Riedler has examined this problem in detail and recorded many tests in a classically important series of records published in or about 1912 under the title "The Determination of the Merits of Automobiles."

Returning to our subject, Mr. Marshall concludes Chapter I—the most important in the volume in the writer's opinion—with a clear statement on the calculation of minimum battery capacity required for given total weights and mileages at 100 Wh. per g.t.m. The effects of gradients and windage are also concisely discussed.

Chapter II discusses the elementary theory of lead/acid/lead and nickel/alkali/iron accumulators, calling attention to the inevitable and fundamental limitations surrounding the problems of specific output, a study of which is commended to those ignorant optimists who at intervals claim miraculous achievements in this field. In plain fact 10 Wh per lb. of complete battery probably represents the maximum realisable output from any practical accumulator if a reasonable life is to be assured—all claims to the contrary notwithstanding. All the leading types are described and illustrated.

A tabloid history of electric vehicles is given early in Chapter III (which may be supplemented by those interested by reference to Milandre and Bouquet, whose "Voitures Automobiles Electriques—Paris, 1899," gives the story in detail), followed by a general survey of modern types of British-made electric vehicles. Mr. Marshall is very impartial and tempers any criticism he tenders by endorsements of practical efficiency in every case, he having in his technical care a large fleet of electrics, including practically every existing type and make—and some others not now made.

Charging equipment is described in Chapter IV, some detail being gone into as to the pros and cons of various equipment for a.c. and d.c. supplies. Battery charging is discussed at length and insistence rightly emphasised on the value of systematic record keeping on properly established forms in the battery department of an electric vehicle garage. Sample forms are given, such as are in use at Glasgow. Constant potential charging is recommended for lead batteries, which, provided proper control is exercised and that a small resistance be inserted in the circuit to give a little control on a fluctuating line voltage, is undoubtedly the correct manner in which to operate this type of cell. Surely it is time that some maker came along with a battery vehicle equipped to charge directly from a 220-V circuit—it is a practical scheme and would save much trouble in charging equipment besides enabling such a vehicle to take charging current at hundreds of places in many cities to-day.

The section on operating experience is of exceptional interest as it gives details of actual results obtained in running a very mixed fleet of electrics over a period of years. Actual data concerning the life of accumulators are given, from which it is established that three years' life may be expected from a first-class lead battery and from six to eight years with an alkaline accumulator of the Edison type.

Conclusion (III) on page 67 reads as follows and should be broadcast:—"There is practically no limit to the useful life of a well-designed and manufactured electric vehicle. After 100,000 miles running, one vehicle is running quite as well as when it was new. The renewals necessary are quite easily carried out, and the wearing parts are of the simplest description."

And listen to No. (IV)!:—"There is practically no danger of a good electric vehicle breaking down on everyday service."

These are the facts which electrical engineers should help to spread. The electric vehicle is a potential load builder for the power station on a grand scale. Every power station should start by having *at least one electric* instead of those old and shabby Fords we see so often and sadly.

Mr. Marshall's excellent little book concludes with a section on electric vehicle testing on the road and one dealing with running costs—also notes on practice outside this country, which latter, however, does not appear of special novelty or to represent any improvement over our own technique. The illustrations of this compact volume are most exceptionally good.

R. J. Mitchell.

Light Fixtures and Lighting Effects. By M. Luckiesh. Pp. xiv + 330; figs. 158. London: McGraw Hill Publishing Co., Ltd. Price, 20s. net.

Mr. Luckiesh's numerous works on illumination, especially its decorative and artistic aspects, are well known in this country. He is an enthusiast for the use of light as a decorative medium and his books are invariably readable.

The present work is no exception. In the preface the author makes a plea for recognition of the great possibilities of present illuminants and lighting appliances, and suggests that decorative considerations are not incompatible with scientific control of light. The first three chapters, "The Potentiality of Light," "The Influence of Nature," and "The Imprints of Usage," are introductory. The next two discuss in turn the physical basis of light and colour and their æsthetic aspects. Such points as the alleged psychological influence of various colours, the mental associations connected with them, and the basis of colour harmonies are treated, and here Mr. Luckiesh gives many useful hints. His table arranging colours in order of preference by males and females, based on statistics, is interesting. Subsequent chapters deal with the relations between light and pigment, and it is shown how, in order to obtain a satisfactory effect, the lighting and decoration schemes must be considered conjointly.

In the next section of the book we have the various Ages (Antiquity, Classical, Middle, Renaissance, &c.), analysed and illustrated. The many sketches of lighting fittings of various periods are well done, and this section of the book is worth reading by anyone who desires to know something of these various periods and gain some acquaintance with characteristic styles.

In the final section of the book Mr. Luckiesh sets about his task of showing how new illuminants may best be grafted on to old decorative schemes—for instance, how far flames may be replaced by electric lamps without the latter becoming obtrusive

—and illustrates the decorative possibilities of modern lighting devices. There is undoubtedly a good field for study in connection with the possibilities of coloured light, flood-lighting, &c. In the future anyone who has both a technical knowledge of lighting and an appreciation of considerations that appeal to the architect should find many opportunities of service. Mr. Luckiesh's book is both stimulating and readable and comes at an opportune moment.

Electrical Engineering for Mining Students. By G. M. HARVEY, M.Sc., B.Eng., A.M.I.E.E. Pp. vii+156; figs. 108. London: Sir Isaac Pitman & Co., Ltd. Price 5s. net.

To present a comprehensive account of elementary d.c. and a.c. technology within the limited compass of 156 pages is no mean task, and although the book before us is not beyond criticism, the author has accomplished this task with a considerable measure of success. The work will be a useful summary of basic theory for the young student of mining electrical engineering and will serve as an introduction to the author's larger and more comprehensive book.

The chapter on d.c. theory is generally good, but the treatment of magnetic quantities is too superficial. The equation $B = 0.4\pi IT/L$, although numerically correct for a magnetic circuit in air, is only so because of an arbitrary value of unity for the permeability. The latter quantity is not explained at this stage, and does not appear till the theory of the dynamo is considered. The chapter on this subject gives a good account of the elementary principles of armature winding, commutator, and methods of field excitation; d.c. motors are also satisfactorily treated.

The chapter on a.c. theory can only be regarded as suitable for supplementing instruction received in the class-room and laboratory, and although the author has done well in the limited space at his disposal, the development of the theory is not as coherent as one would like. As a knowledge of elementary trigonometry is assumed there is no justification for asking the student to take the $\sqrt{2}$ ratio of maximum to virtual value of alternating quantities on trust. The notion of form factor which should have been introduced at this point is brought in casually later in treating the theory of the alternator. A useful chapter on the transformer follows, in which, however, we notice the statement that the regulation of a transformer should have as low a value as possible. The student should rather have been instructed in the reasons for designing power transformers with fairly high reactance. Alternators are dealt with before polyphase circuits, and the author has not therefore been able to utilise the useful rotating field method of dealing with armature reaction. In the chapter on 3-phase circuits great pains have been taken to make this difficult subject clear to the beginner. A good deal of space is devoted to the two-wattmeter method of measuring the power factor of balanced 3-phase circuits. We cannot agree with the author that this method is an accurate one; 3-phase circuits are rarely sufficiently exactly balanced or loads sufficiently steady to give more than approximate results. We do not consider, moreover, that the lengthy algebraic transformation of the formula from the tangent to the cosine form need have been given in a book of this character. A good elementary account of the polyphase induction motor is followed by brief descriptions of the synchronous motor, the rotary converter, and the motor converter. The references to electrical instruments throughout the book are scanty. It is hardly correct to state that the moving iron type of ammeter is almost universally used for commercial a.c. measurements. Useful feature of the chapters on electrical machinery are the careful explanations of the method of obtaining efficiencies and the fully worked out illustrations.

The book will be very acceptable, not only to the class of reader for whom it has been specifically written, but also to elementary students and to electrical artisans desirous of obtaining a knowledge of basic theory. From the point of view of production, the book is a credit to the publishers.

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from April 14th :—

Windmill (design only). No. 465,892. Class 6. Electric suction cleaning machines.—H. E. Chamberlain, trading as the Excelsior Electric Cleaner Co., 5, Robert Street, Adelphi, W.C.2.

Ever Ready (lettering and design). No. 466,193. Class 8. Electrical batteries and cells, accumulators, voltmeters, electric flexibles, electric cigar and gas lighters. No. 465,300. Class 11. Lamps ((electrical), coils (electrical), dry batteries and accumulators, all for medical or dental purposes. No. 465,301. Class 13. Electric lamps, lamp and torch cases and holders, switches, fuses, &c., and electrical fittings for motor cars.—Ever Ready Co. (Great Britain), Ltd.

Magnet (lettering and design), No. 444,263, Class 8, and No. 440,350, Class 13. Electric switchboards not containing a magnet.—F. B. Cox, trading as the Magnet Engineering Co., 65, Fleet Street, Birmingham.

Spenserphone, Spensers (Scotland), Ltd. (lettering and design). No. 467,318. Class 8. Instruments and apparatus for use in radio-telephony and telegraphy. —Spensers (Scotland), Ltd., 119, George Street, Edinburgh.

Tec, British Make (lettering and design). No. 467,465. Class 8. Electric batteries and cells, voltmeters, flexibles, cigar and gas lighters. No. 467,466. Class 13. Electric lamps and bulbs, lamp and torch cases and holders, switches, fuses, &c., and automobile fittings.—Efandem Co., tLd., 11, Fitzroy Square, W.1.

The "Have" (lettering and design). No. 461,524. Class 14. Cat whiskers of gold and silver for use in radio-telephony.—The firm trading as the Comton Wireless Manufacturing Co., 26-28, Bartholomew Square, E.C.1.

Ceag (lettering and design). No. 453,218. Class 20. Electric lamp bulbs, glass trays for charging stands, &c., all being goods for use in connection with miners' electric safety lamps.—"Ceag" Miners' Supply Co., Ltd.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

Electricity Supply in the United States.

THANKS to the public spirit of the American Chamber of Commerce in London, last week an interesting address was given by Mr. Samuel Insull on the progress of electricity supply in the United States. He is the acknowledged leader of that public service in America; he is proud of his English birth—and we are proud of him. His views on the subject of electricity supply command attention, and a report of his address will be found elsewhere in this issue.

Those who have read the Weir Committee's Report are aware that Mr. Insull was consulted by that Committee, and in some cases his remarks are quoted verbatim; that his judgment is correct, as applied to American conditions, is attested by the unqualified success of the great undertakings under his control, and the extraordinary development of electricity supply in the 10,000 square miles served by them. As he remarked in the course of his address, the output of electricity in that area is only 10 per cent. less than the whole amount generated in this country, though the population of the area is only one-tenth as great; and the capital invested in generating plant is only half as much, the load factor being over 48 per cent., or about double the average obtaining here.

Mr. Insull, therefore, in dealing with electricity supply in the United States, knows what he is talking about; and when he turns to electricity supply in Great Britain, his sole purpose is to place his great experience at our disposal and thereby to promote the welfare of his Mother country. Knowing his ability and sincerity, we are reluctant to differ from his conclusions, but, so far as they relate to this country and only so far, we must do so to some extent, for reasons which he himself indicated—namely, that the conditions in the two countries are essentially different, so that what suits one would not necessarily suit the other. The methods of control, says Mr. Insull, are different; the United States is a young country; there, less respect is shown for vested interests—and, we may add, fewer interests have grown up; drastic regulations are laid down, which the British would dislike; the industry is almost wholly in the hands of companies, which, unlike our municipalities, can and do amalgamate freely; and the

United States, ever since the outbreak of the world war, has enjoyed unexampled prosperity with only a temporary lull, so that its inhabitants have had ample means to adopt electrical methods.

Turning from these sociological features to the physiography of the subject, we find that Mr. Insull cites three great areas in which interconnection (with few interruptions) has been fully carried out. Why? Because, in every case, water-power is available in some part of the area, and the only means by which it can be utilised is by transmission in the form of electricity. It is obvious that water-power is ideally adapted for carrying the long-hour loads, whilst steam power is eminently suitable for carrying peak loads; hence the well-known plan, which has been carried out in many other countries and is by no means peculiar to the United States, being plain common sense, of operating steam and water-power installations in conjunction with one another, by means of interconnecting mains. The case of California, which has been cited as possessing a "grid," is particularly irrelevant, for there we find abundant water-power in the mountains and not much coal available; hence there has been developed a colossal system of hydro-electric stations in the remote highlands, from which a continual stream of electrical energy flows, always in the same direction, down to the plains to feed the great cities. We can and do admire this wonderful development, but it has no bearing at all upon our case.

Let us look at home. Here we have coal-fields adjacent to every industrial district, for the obvious reason that the latter grew up near the former. The load curves are very similar, the generating plant is all of the same type, depending almost wholly on fuel, and there is no economic reason whatever for transmitting electrical energy across country—any slight gain due to increased diversity factor or improved load factor, highly hypothetical at best, would be swamped by the capital charges and the energy loss on a long transmission line. Moreover, the cost of generation is a minor factor in the total cost of supply. The only sound technical reason for coupling widely-separated power stations here is that of increasing the reliability of supply, but in view of the fact that that object can be more cheaply attained by installing additional plant, this argument fails to satisfy commercial requirements. As for the provision of supply to the areas between the power stations from the high-pressure interconnecting cables, when every tapping costs many thousands of pounds, this argument is futile in the extreme. Distributing systems at lower pressures must necessarily be run on appropriate routes, and this can be done just as well in the absence of the e.h.p. links. The North-East Coast is a case in point, where also the benefits of power supply from waste-heat sources are secured. All the realisable objects of the "grid" system in this country can be attained without converting the country into one huge "district."

As regards the question of "massing" generating plant, this is a natural consequence of a large demand; it may also be argued that a large demand is the consequence of massing generating plant, but this is not so certain. Generating sets of 60,000 kW are installed in the United States, others of 75,000 and 80,000 kW are on order, and we learn, with some astonishment, from Mr. Insull that a single set of 200,000 kW is under contemplation for a new station which is now being commenced. This set will consist of one h.p. and two l.p. turbines coupled to generators, and when any one machine breaks down, the other two will be capable of carrying upwards of half the rated load, at reduced efficiency. At present we have no station of anything like 200,000 kW, and no use for any generating set above 50,000 kW capacity; we doubt, indeed, whether it is desirable to install sets of greater capacity, for various reasons. The size of generating sets is only one of many factors in the economy problem, and bears no comparison in importance with the load factor. That is really the crux of the whole matter.

Electricity Supply Data.

In our "Correspondence" columns to-day, Mr. Hugh Quigley calls in question the accuracy of the data given in our leading article of April 16th. Whilst the *Electrical World* presumably would not lay claim either to infallibility or even to "sufficient infallibility," whatever that may mean, our contemporary makes a special feature of statistical returns and analyses, and unlike the Weir Committee, draws a clear distinction between units generated and units consumed. On page 7 of its issue for January 2nd, 1926, in tabulating the figures which we used in our leader, it states in a footnote that the data given for "Total Energy Generated" for the years 1920-1925 are "as collected by U.S. Geological Survey," the authority on which our correspondent relies. We have now consulted the annual report of the Geological Survey last issued under date June, 1925, and find that the energy generated during the calendar year 1924 by public utility undertakings is there given as 59,014 million kWh, as compared with the figure of 54,413 million attributed to the same authority by the *Electrical World*, showing the discrepancy to which Mr. Quigley draws attention; the difference is due to the fact that the aggregate figures given by the Survey (which are also tabulated on p. 10 of the same issue of the *Electrical World*) are not confined to central-station output, but include energy generated by electric railway and certain other plants that contribute to the public supply. On the other hand, the American figure that we used includes 6,200 million kWh for railways supplied from central stations, whilst most of the British railway consumption is excluded from the Electricity Commission's figure. Nevertheless, if we take the original figure of the Survey for 1924 we find that the units generated per head were 520, and the units consumed (at 81 per cent.) would be only 420. Hence our suggestion that the computer of the figures for the Weir Committee "made the serious mistake of basing it upon the *energy generated*, and comparing the result with the British figure for *energy consumed*," stands unrefuted. We may add that in a comparative survey of the world's output in the issue of the *Electrical World* for January 9th, p. 99, the energy generated *per capita* in the United States in 1924 is given as 484 kWh.

The Fuel Consumption Returns of the Electricity Commission to which our correspondent turns for "the only true comparison" are not relevant to the matter. Throughout the various discussions on this subject the comparison has purported to be made not between the quantities of electrical energy generated, but between the respective *consumptions* recorded, and in every case we have accepted the figures for British consumption given on the authority of the Electricity Commissioners themselves.

Mr. Quigley challenges other figures given by the *Electrical World*, which states that it carried out a "nation-wide survey" at the beginning of 1925, covering "every industrial plant of the United States using electrical energy," and received valuable co-operation from the Manufacturing Division of the U.S. Census Bureau, besides using official data. We must refer him to our contemporary for satisfaction on the points he raises. We stated the source of the data, and gave them for what they were worth. We believe that they are reliable. There are no such data available in this country. With regard to his suggestion that our comparisons were "very much in the nature of special pleading in favour of this country," if he means that we distorted facts for that purpose, we deny it with the utmost emphasis permissible in print; if he means that we are trying to obtain justice for our country, we accept the compliment with pleasure. It is high time that someone had a good word to say for the old country.

Stage Lighting.

It is now about seven years since Mr. J. B. Fagan read his paper on "The Art of Stage Lighting" before the Illuminating Engineering Society, treating the matter from the standpoint of the actor and producer of plays. One of the main points on which he then insisted was the advisability of diffusing the light and obtaining soft shadows by methods equivalent to the use of an "artificial sky." Since that date there has been substantial progress, and stage-lighting apparatus has been much improved. The paper read before the Society by Mr. H. Lester Groom, on March 30th, contained an interesting review of such developments. Amongst these an important place should be assigned to the "cyclorama," enabling panoramic and special colour effects to be obtained, and realistic atmospheric phenomena imitated. In some cases this has made possible radical departures in methods of presentation. Mr. L. G. Applebee also contributel some striking demonstrations, including the projection of a realistic image of the moving waves of the sea. Modern electric lighting is equal to almost any task the producer may set. What is chiefly needed is a recognition on the part of producers and scenic artists of what light can do, and a realisation that expenditure on apparatus for producing novel and striking light effects is well repaid—in short, a little more imagination and "vision." The Illuminating Engineering Society has done good service in providing this opportunity of drawing attention to the possibilities of stage-lighting, and the facilities for demonstrations available at the E.L.M.A. Lighting Service Bureau, where this meeting was held, proved very useful.

The Electricity (Supply) Bill.

The communication which we have received from Mr. R. A. Chattock, president of the Institution of Electrical Engineers, and which is printed on pp. 719 and 720 of this issue, deserves the careful study of everyone interested in the future of electricity supply in this country; it is closely in harmony with the views which we have put forward from time to time, and represents also the opinions of many engineers with whom we have discussed the subject.

It will be remembered that the Council of the Institution recently entered a grave protest against certain provisions of the Bill, as being based upon imperfect knowledge of the facts and likely to prove detrimental to the national interest (Elec. Rev., p. 527). The matter cannot be left there. If the Government does not institute the proposed inquiry into the fundamental questions on which the Bill is based—and in our opinion it never will do so—it will be the plain duty of the Council to call together a meeting of those interested in electricity supply, who up to the present have had no opportunity of publicly stating their views.

The Kelvin Lecture.

That the Kelvin lecture, in memory of the greatest man of science that has lived since Newton, should be delivered by Sir J. J. Thomson, President of the Royal Society, in the theatre of the Institution of Electrical Engineers, and should deal with "The Mechanics of the Electric Field," was surely a most happy combination of circumstances; for the Master of Trinity, described by Sir Oliver Lodge as also Master of Physics, has done more, probably, than any other physicist towards solving the problems presented by his difficult subject: Certainly, if we add to his labours the achievements of his pupils and colleagues, there can be no question that the Cavendish Laboratory, over which he presided for 34 years, has led the world in the attack upon the constitution of the atom, and has gone farthest towards revealing its secrets.

Sir Joseph had no difficulty in showing that electric force might reasonably be regarded as possibly intermittent in its action, taking the pressure of a gas as an analogy, and thus he proposed to reconcile the phenomena which can only be explained on the quantum theory with those which come within the scope of ordinary dynamics. Light, in particular, and X-rays in some respects are in conformity with the theory of propagation by wave motion and in others with the corpuscular theory which Newton preferred; the hypothesis outlined by Sir Joseph combines the two theories and provides an explanation both for interference effects and for photo-electric phenomena. For this purpose the electron must possess a structure, which he visualised as an atmosphere of particles surrounding the electron, possessing a definite period of vibration, and capable of emitting radiation. Much of the lecture was devoted to a mathematical discussion of the mechanism required by this constitution, conducted in that inimitable style which gives a peculiar charm to Sir Joseph's lectures.

The Institution is to be congratulated on receiving so lucid an exposition of the new theory from its distinguished author.

If the Cap Fits——.

We have a good deal of sympathy to spare for the young man who is anxious to "get a move on," but cannot do so because of the restraining influence of those who, above him in authority, are fearful lest his enterprise may be unconventional, may be off the beaten track over which the old cart has travelled so long and so safely, may offend somebody's susceptibilities, or may bring undesirable aggrandisement to the "young upstart." Of course, not all the new ideas of impulsive youth are to be swallowed at one gulp; it does not require hoary-headed experience to recognise that, even the initiator knows it—in most cases. But in times when change is so rapid, and especially in an industry which is always moving and presenting new possibilities, new opportunities, and creating a new atmosphere, it were well for all of us, whatever our age or experience, to be susceptible to the originality, ingenuity, and suggestiveness of others and not to get into the habit of closing our armour tight as though desiring it to be proof against the fiery darts of the wicked. Experience is priceless in its value, but where the possession of it is accompanied, as it sometimes is, by too profound a regard for conventionality and red-tape procedure, enterprise can be easily stifled, the spirit of youth broken, and out-of-date methods proceed along the inevitable pathway to loss and defeat. If we were to give any direct application to these moralisings we might leave untouched some who might otherwise profit by them, for though one comes across instances of those whose schemes have been brought to naught by prejudice rather than on de-merit, and though we could quote chapter and verse and names for such happenings in electrical trade, manufacturing and particularly in electricity supply—there is the possibility that specific cases might prevent the reader exercising those powers of introspection which are so useful a means of helping him to steer his own course amid the rocks wisely. New brooms in sweeping clean may make an insufferable smother of dust; a vacuum cleaner would do the job better, of course, but if a new broom be bought the user must be allowed a reasonable amount of latitude in its manipulation. We do not seriously object so long as the cobwebs gathered around the wheels of electricity supply enterprise are cleared away, whether it be a broom or a vacuum sweeper that accomplishes it, but we do know that some electrical undertakings would please their consumers better and profit the electrical industry more, if they would show a greater measure of adaptability than they do to the present age. Are there not company directors who are fearful when their staffs make new proposals, and municipal committeemen and councillors who find it easy to defer the adoption of advanced methods which their chief engineer and his staff are restlessly eager to employ? Having said so much, we leave it to all of our readers to wear the cap if it fits them—they can easily tell!

Electrical Developments at Ilford.

The A.C. Extensions to the Distribution System.

As we mentioned in our issue of April 16th, an official visit was made on April 8th to the converting sub-stations and one of the transformer kiosks of the Ilford Urban District Council Electricity Department, when the extensions to the distributing system were inaugurated by the Revd. Herbert Dunnico, M.P., J.P., chairman of the Council.

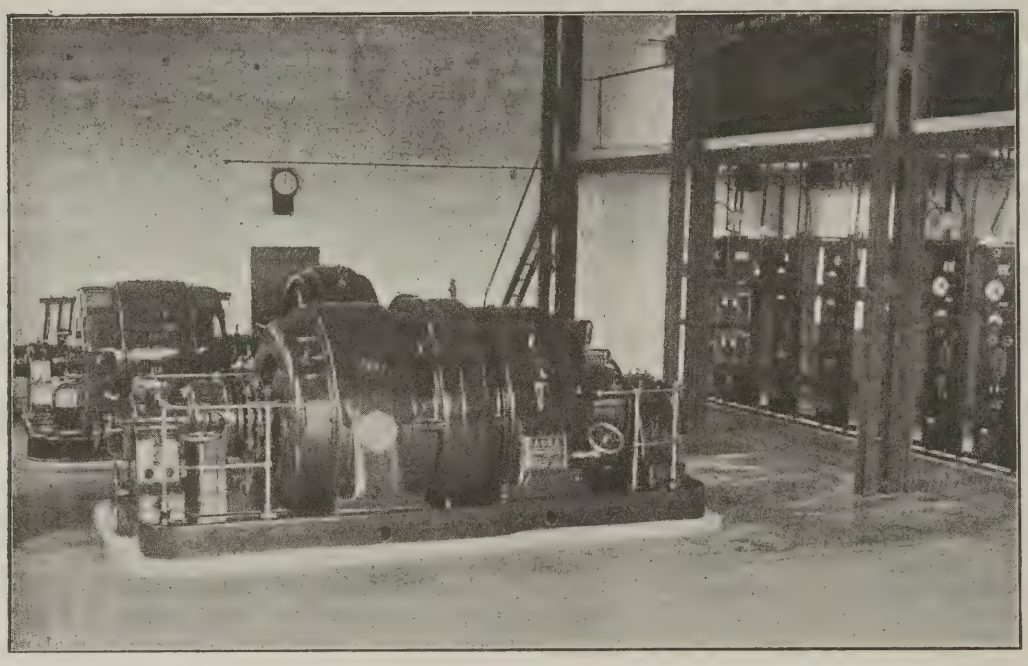

Fig. 1.—Uphall Road Sub-station.

The electricity supply in Ilford was commenced in 1901, l.p., d.c. systems for both generation and distribution being adopted. After the war it was found necessary to reorganise the systems, and two 3-phase, 6,600-V turbo-alternators were installed at the Ley Street generating station in 1920 and 1921; the sub-stations referred to have been installed at different times since then to make the necessary conversion of the a.c. energy for use on the d.c. system. In 1920 the Council was refused permission by the Electricity Commissioners to further extend the generating plant, and it became necessary to take a bulk supply of energy from an undertaking outside the district; hence in 1924 an agreement was reached between the West Ham, East Ham and Ilford authorities to an arrangement for West Ham to supply in bulk to the other undertakings interested. The necessary e.h.p. trunk transmission lines were laid between the West Ham and East Ham stations in 1922, and in 1924 they were extended from the East Ham station, *via* Barking, to the receiving sub-station of the Ilford undertaking adjoining Uphall Road, from where cables were laid to the Ley Street works.

The Uphall Road "sub" was erected in early 1924 primarily for the purpose of affording an increased supply of energy to consumers in the vicinity, and also as a receiving and metering point for the bulk supply from West Ham. The sub-station is at present equipped with two 1,000-kW La Cour converters, and arrangements are made for the installation of a third set, which is expected to be in operation by October next. The e.h.p. switchgear, which was installed by the General Electric Co., Ltd., is of the mechanically-operated remote-control type, the actual switch equipment being installed in a gallery built over the control board. A separate panel is installed on this board for the bulk-supply metering, this being equipped with two sets of meters and indicators by the Aron Meter Co., and duplicate bus-bars are provided, by means of which it is possible to connect either of the mains from West Ham to either of the link cables to the Ilford generating station.

The Gants Hill sub-station, which is situated at the junction of Cranbrook Road and Eastern Avenue, is of the fully-automatic type, the equipment being supplied and installed by the Metropolitan-Vickers Electrical Co., Ltd. It was first put into commission in December last. It is designed to come into operation when the pressure of the system falls below a given value, the reverse action taking place when the load on the system falls off. As already mentioned, a feature of the sub-

Fig. 2.—100-kVA. Transformer Kiosk.

station is that the converting plant is not disconnected from the system until 20 minutes after the load falls below the set value. The necessary conversion at Gants Hill is effected by means of a 500-kW rotary converter fed from a 550-kVA transformer. A 4-panel control board accommodates the necessary relays and switchgear for controlling the a.c. side of the machine, the d.c. equipment being installed on a separate panel of an open-type distribution board. Four Metro-Vick K-type e.h.p. oil switches are installed, two for the control of the incoming and outgoing feeders and two for the control of the supply and operating transformers. It is interesting to note that a contract has been placed with the makers for a duplicate equipment to be installed in the district, which is expected to be in operation by October of this year.

The sub-station at Grove Road was first equipped in 1916 to give an a.c. supply to the adjoining works of the Fuller Electric & Manufacturing Co., Ltd. Since that time the station has been extended, and is now equipped with three G.E.C. rotary converters, 250, 280, and 500 kW, and the necessary transformers, which were manufactured by the Brush Electrical Manufacturing Co., Ltd., A 6-panel, steel-cubicle, e.h.p. switchboard and a 7-panel, open-type, d.c. board were installed by the General Electric Co., Ltd.

The "sub" at Goodmayes, which is now equipped with two 500-kW Crompton converters, two 550-kVA British Electric transformers, a 4-panel steel-cubicle e.h.p. board, and an open-type d.c. board, both of Crompton manufacture, was first used in 1915 as a battery sub-station. The sub-station forms the back portion of a large building, the front part of which is utilised as a showroom. This is served by two large display windows on either side of the central entrance. The showroom proper occupies the full frontage of the building, and on one side are accommodated cubicles for lighting demonstration purposes.

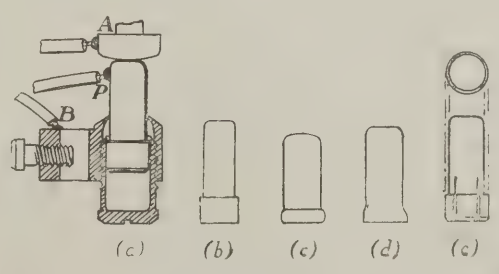
During last year the e.h.p. mains were extended to Barkingside, and a transformer kiosk, fig. 2, was erected at the corner of Fencepiece Road and Tomswood Hill for an a.c. supply to the Tomswood Hill housing estate and district. The kiosk was supplied by Messrs. Callender's Cable & Construction Co., Ltd. It is a steel structure, about 8 ft. square, and houses a 100-kVA Fuller transformer, three e.h.p. switches controlling the transformer and incoming and outgoing feeders, and four l.p. feeders. A similar kiosk has been supplied by the Foster Electrical and Manufacturing Co., Ltd., and erected near the Hainault station for supplying the district.

The Resistance and Heating of Plunger-Type Lampholders.

By L. G. H. SARSFIELD, B.Sc., A.M.I.E.E.

Résumé.

In a previous paper* by the author on the above subject, the possibilities of the adoption of plunger-type lampholders for the connecting of domestic electrical apparatus to the supply were discussed. Graphs were given for the voltage drops across various parts of these holders, and the causes of heating were observed. The values of spring resistance were given, and the behaviour of steel and bronze springs was compared. The results of ageing were seen, and curves were given showing the temperature of the air inside lampholders. Heat runs to destruction were described and a suggestion was put forward for increasing the current-carrying capacity of this type of link between apparatus and power.



The manufacturer at whose instigation the above work was undertaken subsequently raised the question of the current-carrying capacity of the contact between the plunger tops and the adaptor, and the experiments here described were designed with this in view and also to obtain the actual temperatures of the other component parts of ordinary lampholders. Messrs. Tucker's lampholders were again employed throughout the following investigations.

Heat Runs with Ordinary "Telac" Lampholders.

Batten-type holders were set up in free air on a table and current was led to and from them at the sleeve blocks "B" (fig. 1 (*a*)).

The source of supply was a battery of accumulators. The load was connected to each holder by means of an ordinary adaptor, and consisted of two variable resistances in series. One of these was of the carbon-plate type and accommodated the heavy currents employed during the latter part of each of these tests.

Fine wire thermo-couples (copper Eureka) were soldered to both poles of the holders and adaptors at the sleeve blocks "B," plungers "P," and adaptors "A" in the positions shown in fig. 1 (*a*). The spring has been omitted in order to simplify the drawing. The point at which a couple was attached to a plunger was near to its top, so as to avoid fouling the sleeve block when compressed downwards, as it is when in use. By this means the temperatures of the different parts of the units were obtained. There was no difficulty in securing temperatures at currents as low as three amperes, although in the previous series of heating tests, mentioned in the first paragraph, five-ampere temperature values were the lowest obtainable. This was due to the fact that the one thermo-couple then used was placed midway between the two plungers and not attached to the active metal, so that there was a difference of temperature between the latter and the couple itself.

a, Mode of attachment of thermo-couples; *b*, *c*, *d*, Types of plunger now in use; *e*, Split plunger.

Fig. 1.—Details of Apparatus.

The thermo-couple wires were led from the sleeve blocks and plungers through the tubular portion of the holder by way of holes suitably drilled therein. The wires were insulated with varnished cambric tubing of outside diameter about 1/10th in. The holes made for the plunger couples were slotted vertically, so as to prevent any restraint upon the plungers due to the couple wires. All the thermo-couples were alike, and were calibrated with the micro-ammeter used throughout the whole series of observations.

Beginning at 3 amperes, current was passed through each holder and the temperature registered by the micro-ammeter deflection. Conditions were considered to be steady for each value of current when there was no

* Electrical Review, February 13th, 1925.

readable alteration of the instrument needle after five minutes. Observations were made at 3, 4, 5, 6, 8, 10, 12, 15, 20, 25, 30 amperes, except, of course, when a holder would not permit the higher of these values.

Fig. 2 gives the heating curves for new holders with standard bronze springs, each line being the mean of four sets of readings, *i.e.*, on both poles of two separate units individually tested. Fig. 3 gives similar curves for one holder about 15 years old, but provided with slightly tarnished new bronze springs in place of the steel ones originally found in it.

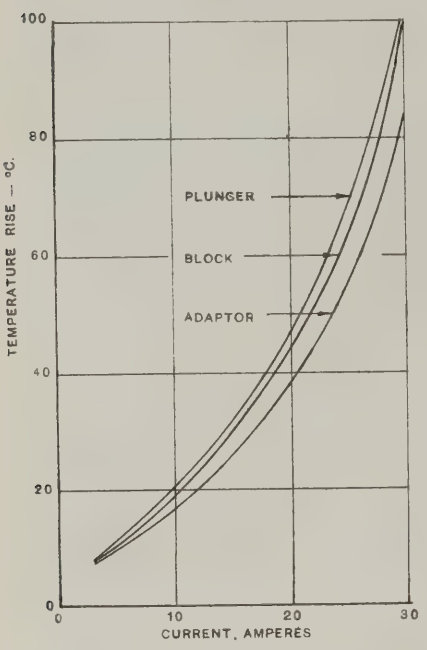


Fig. 2.
Lampholders fitted with new ordinary plungers, new blocks, and new bronze springs.

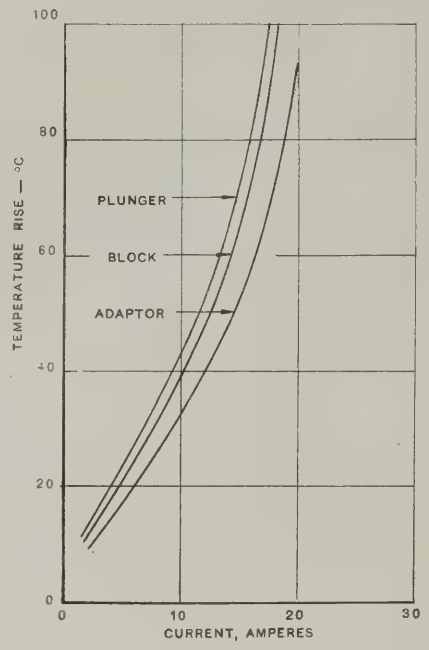

Fig. 3.
Old lampholder fitted with slightly tarnished bronze springs.

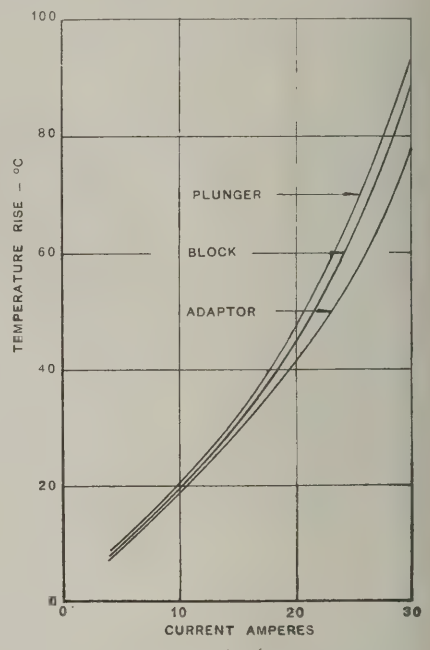

Fig. 4.
Lampholders fitted with new split-plungers, new blocks, and new bronze springs.

Curves showing the Temperature Rise with Varying Current Strength.

The difference between the two sets of curves is very marked, and whereas, after obtaining the 30-ampere readings with the new units, a current of 40 amperes was passed through one of them for five minutes before collapse of the spring (indicated by unsteadiness of micro-ammeter reading and "clicking" noises), the springs of the old unit were collapsing before 20 amperes could be reached. Judging from the adaptor temperatures in figs. 2 and 3, the coolest contact of the three in each case is that between the adaptor and the plunger, and this suggests that it is not this part of the holder which, up to the present time, forms its current capacity limiting feature. The hottest part in every case, however, is the plunger.

The previous series of experiments showed the contact resistance between the plunger and the sleeve block to be greater than that between the plunger and the adaptor for old steel-sprung units, and it was with a view to improving the former contact that bronze springs were adopted. The results were encouraging.

Split-End Plunger.

A new method was suggested, however, in the author's previous article* for improving the contact between the plunger and the sleeve block. It was proposed that the flanged open end of each plunger should be a cylinder which would be a fair fit in its sleeve block, so that when compressed or released the plunger would always be in contact with the inside of the block.

*Electrical Review, February 13th, 1925.

Experiments were carried out by Messrs. J. H. Tucker and Co. as to the best method of obtaining this effect, with the result that the standard cylindrical ends of their plungers were saw-cut through along two diameters at right angles (fig. 1 (*e*)). This arrangement permits the plunger end to be sprung slightly outwards, and a positive contact with the inside of the screwed cylinder which enters the bottom of the sleeve block is thus obtained. The fit is not such as to introduce undue friction, and, moreover, the rubbing surfaces tend to keep bright due to the movement of one with respect to the other whenever an adaptor or lamp is inserted in, or withdrawn from, a holder. With this scheme the spring is no longer the main current-carrying medium, and therefore steel springs may be used with confidence. In fact, they would be better than bronze ones, on account of their superior mechanical properties. A test of a holder fitted with split-end plungers and steel springs is described later.

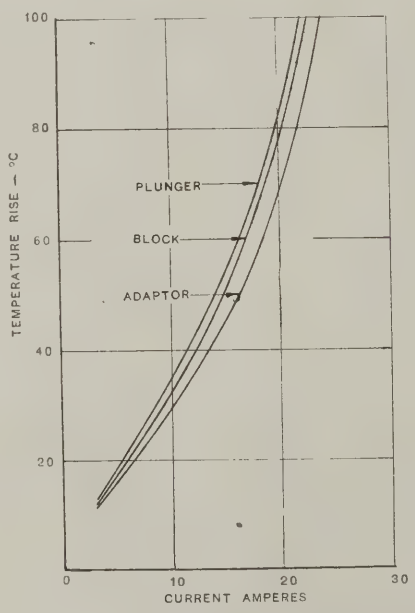

Fig. 5.—Lampholders fitted with artificially-aged ordinary plungers, blocks, and bronze springs.

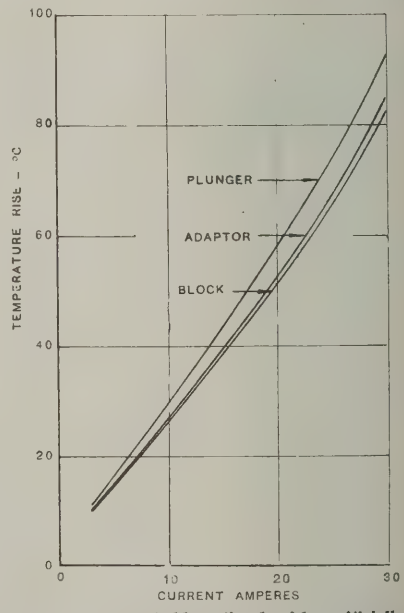

Fig. 6.— Lampholders fitted with artificially-aged split plungers, blocks, and bronze springs.

Curves of Temperature Rise with Current.

Resistance of Split-End Plunger.

The values of voltage drop between plunger and sleeve block for split-end plungers were compared with the values for ordinary plungers. Six plungers of each type were fitted with new bronze springs in sleeve blocks.

Without mounting these in holders, current leads were soldered to the plunger tops and to the blocks, and thus the only movable contact in each unit was that whose resistance was required. A current of 3 amperes was passed through each unit, and by means of flexibles soldered one on to the plunger and one on to the block and connected to a milli-voltmeter, the voltage drop across each unit was measured.

Three voltage drop readings were taken for each unit—

(*a*) with the plunger fully extended under the influence of the spring;
(*b*) with the plunger pressed in as far as possible; and
(*c*) the maximum swing observed on the instrument during a number of rapidly applied compressions and releases.

The mean values are below, and they point to the improvement of contact due to the split-end plunger :—

	(*a*)	(*b*)	(*c*)	
Ordinary plunger ...	7.9	2.0	15.3	millivolts
Split-end plungers ...	2.3	1.5	3.3	,,

The "*c*" values of the "ambient" plunger are particularly significant, and testify to the regular travel of the plunger, in and out. This is a feature of importance, especially when the holder is subjected to mechanical shock, since (as mentioned in the previous article) the looseness of fit of the plunger in the sleeve block, common in many types of holder, may constitute the spring the only electrical connection between them. This is, of course, very undesirable.

Heat-runs with Split-End Plungers.

In order to compare the temperature rises of holders having split-end plungers with standard ones, units were arranged as described in paragraph 3. The heating curves for new units fitted with split-end plungers are plotted in fig. 4.

Each line is again the mean of four sets of readings. As would be expected, they are similar to those of new ordinary holders (fig. 2), but the latter have steeper slopes and higher temperatures beyond 20 amperes. Slight permanent compression of the springs was noticed after 30 amperes in each of the two holders tested, but one was subjected to further test and carried 40 amperes for five minutes, followed by 50 amperes for three minutes. This caused crippling of the springs, *i.e.*, permanent compression to about half the original length, but not entire collapse.

Two new holders, one with split-end plungers and the other with ordinary plungers, were then equipped with new steel springs and the current-temperature curves taken for each. The mean temperatures for the two poles of each unit at 30 amperes were as follows :—

	Adaptor.	Plunger.	Block.	
Ordinary plungers ...	76.3	92.5	84.3	deg. C.
Split-end plungers ...	57.1	65.9	59.5	,,

After the 30-ampere readings were taken, the ordinary type holder sustained 50 amperes for five minutes, with the result that one spring was slightly compressed and the other crippled, while the holder having split-end plungers sustained 50 amperes for five minutes and the springs were apparently unaffected.

It is, however, the performance of old holders which must be the test of serviceability, but as no old split-end plunger units were available, artificial ageing was resorted to. Two split-end plunger and two ordinary units, each fitted with new bronze springs, were dipped into a boiling liquid consisting of equal proportions of sodium hyposulphite and lead acetate. This gave them a light brownish-blue coloration on the outside which is similar to the appearance of really old parts. The insides of the ordinary type plungers and blocks remained practically new, while owing to the saw-cuts in the split-end type their inner surfaces were tarnished, though not to the same extent as their outsides.

These plungers were set up in holders for heat runs in exactly the same manner as those already described, and fig. 5 gives the mean temperature curves of the two poles for the ordinary type, while fig. 6 gives those for the split-end type.

The difference between the two sets of curves is easily seen, and it is definite over the whole range of the curves. For instance, the average temperature rise represented by the three curves for the holder fitted with split-end plungers at 5 amperes is 15.3 deg. C., whereas that for the ordinary type is 17.4 deg. C., which means that there is about 12 per cent. reduction of heating at this current rating. Since the slope of the curves for ordinary holders increases with current so much more rapidly than that of the curves for the split-end type, this percentage gradually grows, and at 20 amperes reaches about 28 per cent.

After the heating curve readings were taken on each of these artificially-aged units, higher currents were passed through them; the ordinary type withstood 40 amperes for four minutes and then smoking commenced, while the split-end plungers withstood 40 amperes for eight minutes, and subsequently 50 amperes for three minutes, without damage to the springs.

The appearance of the one really old ordinary unit whose temperature rise was measured (fig. 3) was similar to that of the artificially-aged units described above. This old unit collapsed at about 20 amperes. A holder was, however, put on test which had been fitted with split-end plungers artificially aged until they were almost black outside and dark brown inside, i.e., in a condition much worse than any really old units ever seen by the author. It gave a plunger temperature rise of 110 deg. C. at 20 amperes, and subsequently withstood 30 amperes for eight minutes. After such a severe test the springs were crippled.

All these experiments support the view that the split-end plunger is a good current-carrying proposition, and application is being made for a patent in respect thereof. The properties of this type, which render it able to carry large currents satisfactorily, must contribute to greater reliability at all ratings, and, furthermore, make the plunger practically independent of a current-carrying spring. Steel springs, as already mentioned, may thus be used—their electrical inferiority to bronze ones being of small account, while their mechanical superiority is valuable.

	Spring Steel.	Spring Bronze.	
Young's modulus ...	13,000 tons/sq. in.	5,000 tons/sq. in.	approx.
Annealing temp. ...	350°C	250°C	approx.

By employing split-end plunger lampholders, the need for wiring power plugs in order to use most domestic appliances is obviated, and it is suggested that the convenience of being able to connect up such apparatus to a lighting point is important and calculated to popularise the use of electrical gear in our homes. The increase in cost for split-end plungers in all the lighting points of a domestic installation would be negligible.

It is a pleasure to acknowledge the co-operation of the Governors of the Merchant Venturers' Technical College, Bristol, and Prof. D. Robertson, D.Sc., who provided facilities in their electrical engineering laboratories, and also the kindness of Messrs. J. H. Tucker and Co. in supplying the lampholder parts used in these experiments.

A New Fire-Damp Indicator.—At a recent meeting of the Austrian Natural Science Society, of Innsbruck, Herr Martienssen, of Kiel, read a paper in which he described a new electric safety lamp for the use of miners in places where firedamp explosions are feared. After many unsuccessful attempts, Martienssen claims to have succeeded in producing a firedamp-indicating electric lamp by using small semi-circular loops, made of a preparation of palladium, placed in a small glass bulb which is closed at its upper end by a porous stone. By means of a button switch, the current from a small accumulator carried in the base of the lamp is passed through the filament, which causes its extremities to assume a dark red colour, this serving as an indication that the apparatus is in proper working order. If there is methane in the air in the mine, the centre of the filament commences to become more or less incandescent, and if the methane percentage reaches 8 per cent. the filament will remain incandescent even when the current from the battery is switched off. In this way Martienssen considers that it is possible to estimate approximately the quantity of methane in the air in mines.

Electrical Progress in New Zealand.

Some Particulars of the Mangahao Hydro-Electric Scheme.

It will be recalled that the first of the three large water-power schemes adopted by the New Zealand Government in 1918 for the supply of electrical energy throughout the North Island was the one on the Mangahao River, the other two projects being those at the Waikaremoana Lake and the Arapuni Rapids (Electrical Review, August 29th, 1924, p. 314). The Mangahao undertaking is situated close to a large potential load of some 12,000 kVA in the Wellington area, and the site is capable of developing 24,000 kVA. The Mangahao River is almost solely dependent on rainfall for its flow, and therefore its water volume varies considerably. The normal flow is about 150 cusecs, but it has been as low as 70 cusecs. The scheme provided initially for two main storage reservoirs, a third to be added at a later date. The larger reservoir is on the Mangahao River, the smaller one being on the River Tokomaru close to its junction with the Arapeti stream. The two reservoirs are connected by a large concrete-lined tunnel, 7 ft. in diameter and about a mile long, driven through the intervening range of hills. Another tunnel connects the second reservoir to a surge chamber above the power house, from where steel pipes convey the water to the station situated at the junction of the Mangaore and Mangatangi Creeks. The net water drop is 870 ft., and the total fall from the upper reservoir is 995 ft. Fig. 5 shows the general lay-out of the scheme. The construction of the Mangahao and Arapeti dams has proved to be a much more difficult matter than was at first expected, due primarily to the trouble in finding a suitable rock foundation for the base of the dams and to the frequent floods that have occurred since the construction was commenced. The preliminary surveys of the dam sites failed to reveal that both the Mangahao and Tokomaru Rivers had, at some distant period, changed their beds, and in the course of time had cut new beds parallel to the old ones. This discovery necessitated the construction of a cut-off wall from the end of the dam to the solid rock on the far side of the old channel as a seal to prevent water loss by seepage round the end of the dam. The Mangahao dam is 100 ft. high, 118 ft. long, and 95 ft. thick at its base. An automatic steel crest surmounting the structure maintains a constant water level in times of flood. As the water rises over the crest, the increased pressure causes the latter to fall, the distance being governed by a concrete counterweight. The Mangahao reservoir holds 525,000,000 gallons of water.

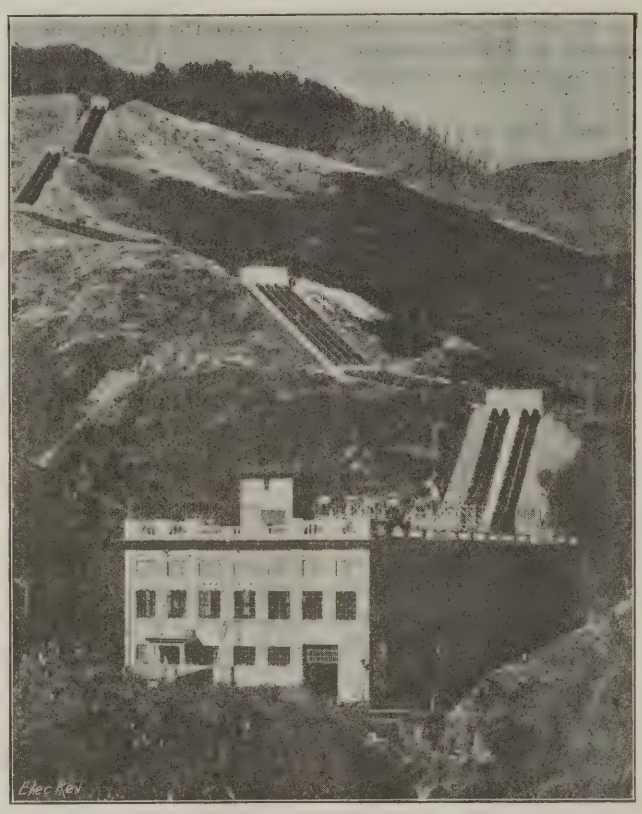

Fig. 1.—Mangahao Station and Pipe Line.

The Arapeti dam is 430 ft. long and of 66 ft. maximum width; and the reservoir has a capacity of 290,000,000 gallons.

The generating-station scheme provides for five main turbines of the Pelton type. Three of these

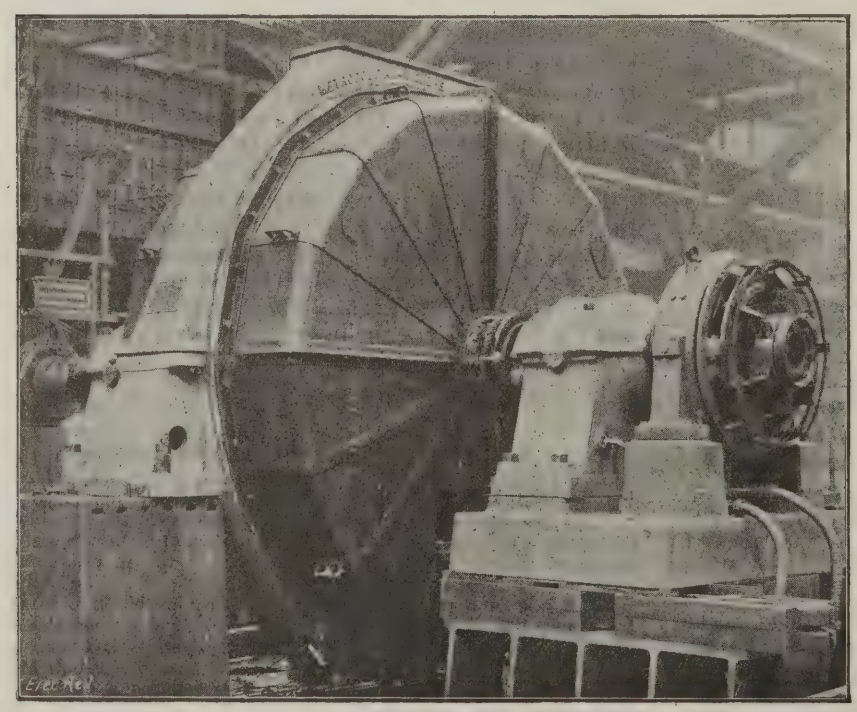

Fig. 2.—6,000-kVA Alternator.

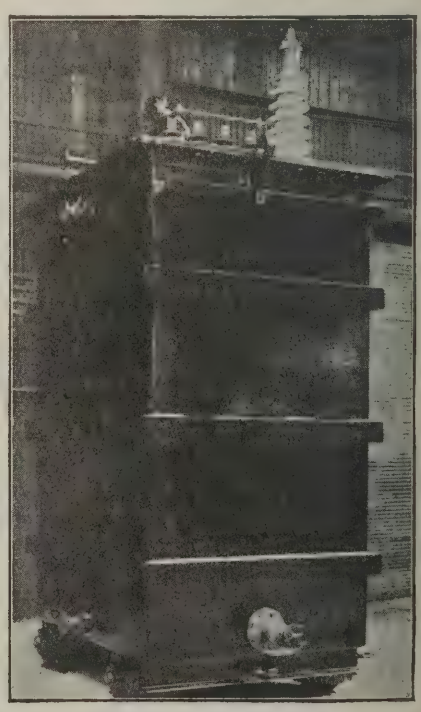

Fig. 3.—Single-phase Step-up Unit.

are designed for a maximum output of 8,000 h.p., and two for a 4,000-h.p. output, both sizes running at 375 r.p.m. under a head of 825 ft. The larger turbines have two jets each, and the smaller machines are provided

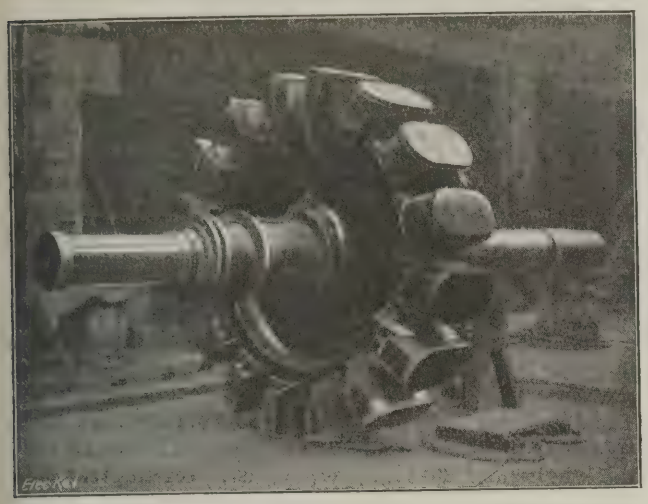

Fig. 4.—Rotor of 6,000-kVA Machine.

with only one jet. The machines are controlled by automatic oil-pressure governors which operate directly on deflectors and indirectly upon the needles. The deflectors cut into the jets and disperse them at times of sudden reduction of load. The needles feed forward slowly, controlled by dashpots, and gradually cut off the supply of water to the required extent. For increasing loads, both the deflectors and the needles are withdrawn simultaneously.

The larger generators are each of 6,000-kVA capacity, and the smaller ones 3,000 kVA. These machines generate 3-phase energy at 11,000 V, 50 periods; fig. 2 shows one of the larger sets, and fig. 4 its rotor. The alternators are excited from separate exciter units, driven either by water power or induction motors. The 3,000-kVA machines are also fitted with direct-coupled exciters. The turbines and alternators are housed in one large room running almost the full length of the building, and the transformer banks are situated in a separate room. Between these two departments are housed the switch and control rooms. The masonry cubicles containing the 11,000-V apparatus are situated on the main floor level. The control room is immediately above the cubicle room, and is so arranged that the switchboard operators have a clear view into the turbine house.

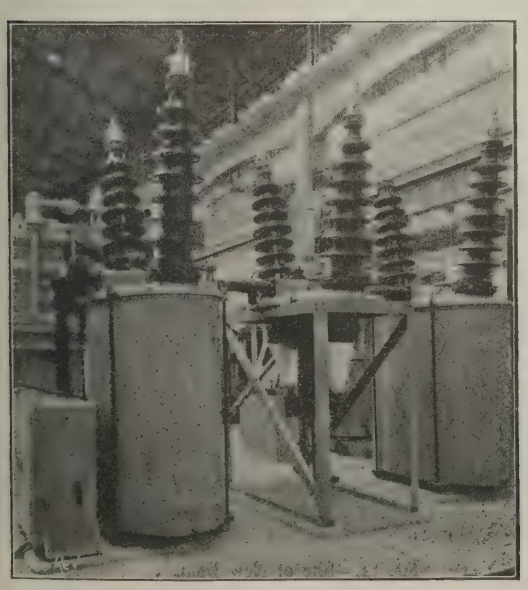

Fig. 6.—110-kV Oil Circuit Breakers.

The 110-kV switchgear is placed partly inside and partly outside the station, the transformer-controlling equipment inside and the feeder switchgear outside.

The transmission lines are dead ended at special points on the building structure, jumper connections linking up to the apparatus on the roof. Fig. 7 shows one of the 110,000-V overhead horn-gap switches.

For the districts immediately around the station energy at the generating pressure is transmitted, but for the long-distance transmission, the pressure is raised to 110,000 V. The main transmission lines are fed through two banks of transformers, and it is interesting to recall that these were the first power trans-

Fig. 5.—General Layout of Mangahao Scheme.

formers of this size to be manufactured in Great Britain for a 110,000-V transmission system. Each three-phase group is of 12,000-kVA capacity, and consists of three single-phase, 4,000-kVA transformers connected in delta on the l.p. and star on the h.p. sides. In addition, one single-phase unit forms a spare to the two groups. Single-phase units, fig. 3, were adopted to facilitate transport over the difficult roads leading to the site. Tappings are arranged on the l.p. windings for 10,750 and 10,500 V, and the full output may be obtained at all the tappings.

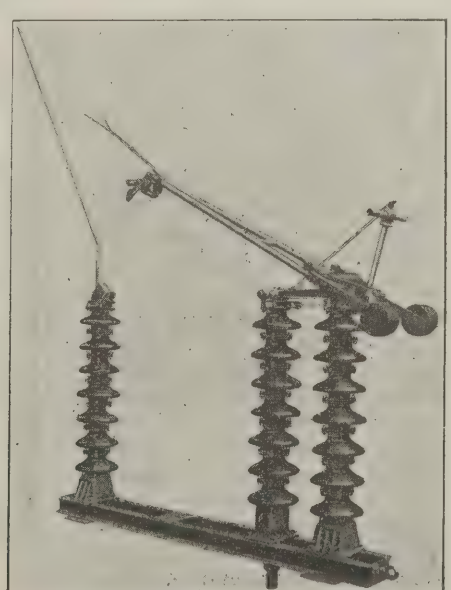

Fig. 7.—110-kV Overhead Switch.

The transformers are of the oil-immersed, forced-cooled, double-wound, core type, and their mechanical construction is such as to allow transport on their sides in the tanks; fig. 11 shows one of the transformers arranged for transport. The h.p. coils are wound

in sections of disk coils, of one turn per layer, thereby reducing the voltage stress between the turns to a minimum.

The main insulation is designed to avoid all danger of creepage along the surfaces, and the end turns of

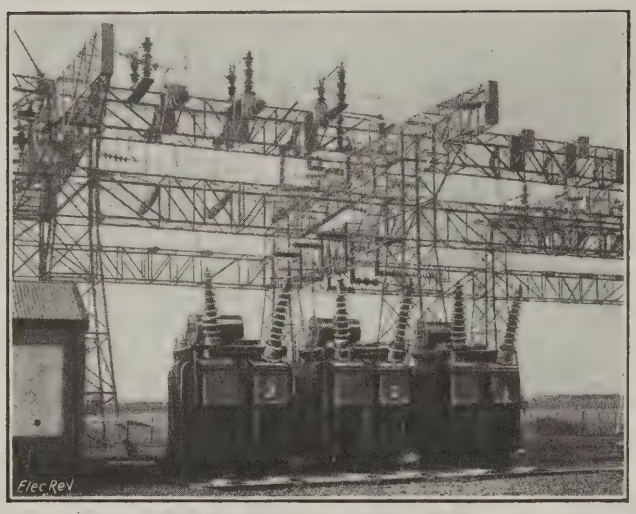

Fig. 8.—Bunnythorpe Sub-station.

both the h.p. and l.p. windings are specially insulated to withstand surge voltages and transient disturbances. The dielectric field is so controlled as to render the pressure gradients as uniform as possible, and the windings are adequately braced to withstand mechanical shocks which may occur under working conditions, including those produced under short circuits. A spring clamp device is arranged between the coils, so that it takes up effectively any shrinkage which may occur in the coils. One set of oil-cooling apparatus, comprising cooler, centrifugal oil pump, motor and controlling gear, is provided for each three-phase group. The h.p. terminals are of the oil-filled porcelain type. The construction of these transformers was described fully in the Electrical Review of October 20th, 1922.

Four high-pressure transmission lines are connected to the station; two of these go north to Bunnythorpe, some 25 miles away, whilst the other two run south to Khandallah, 63 miles, for the supply to the City of Wellington. A duplicate transmission line connects Khandallah with Bunnythorpe, *via* Masterton, Eketahuna, and a switching station at Woodville, whence a branch is also connected to Dannevirke.

The main-line transmission is undertaken by the Public Works Department, and the local distribution is carried out by the various power boards throughout the country. For this purpose sub-stations have been or are being established at Khandallah, Bunnythorpe, Wanganui, Masterton, Eketahuna, Dannevirke, Waipukuran, Napier, and Otaki. From these sub-stations and from the power station at Mangahao energy will be supplied at 11,000 volts to the power boards. The equipment of these sub-stations consists of the main transformers, switchgear, lightning arresters, and recording instruments.

The sub-station of Bunnythorpe, fig. 8, is of the outdoor type and supplies Palmerston North and the surrounding Marawatu district. The equipment consists of a 110,000/11,000-V, 3-phase, 4,500-kVA transformer bank, figs. 9 and 10, and oil circuit breakers, fig. 6, of 400-A normal-current capacity and 495,000-kVA rupturing capacity are being installed on the 110,000-V lines which connect with the switching station at Woodville to the east, and to the north with the Wanganui sub-station, whence a projected line will eventually link up with the Arapuni hydro-electric generating station, two hundred miles further north. Similar oil circuit breakers are installed at the Woodville switching station.

The sub-station at Dannevirke, figs. 13 and 14, is also of the outdoor type, equipped with two 1,500-kVA, three-phase, 110,000/11,000-V transformers.

The greater part of the main and local lines are run on hardwood poles, the former of Australian wood, the latter of Australian wood or New Zealand silver pine, the lines being carried on suspension-type insulators. The 110,000-V lines are composed of 19/13 copper cables spaced at 10 ft. between centres. Figs. 15 and 16 show the single- and double-type poles used for the transmission lines.

Between Khandallah and Packakariki, a distance of about 20 miles over country difficult to patrol, steel towers carrying double circuits are to be used instead of poles in order to reduce to a minimum the risk of line troubles on this section.

Fig. 1 shows the completed generating station and pipe line.

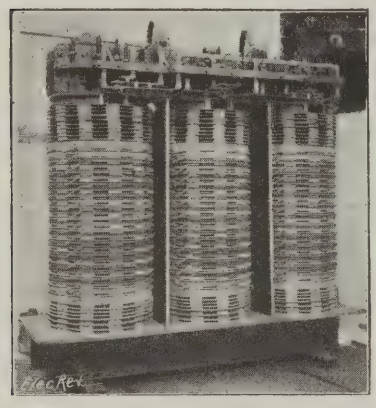

Fig. 9.—Interior of Step-down Transformer.

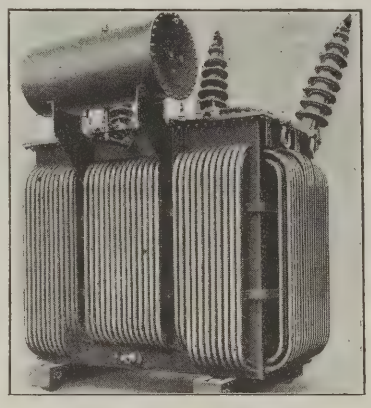

Fig. 10.—Three-phase Unit.

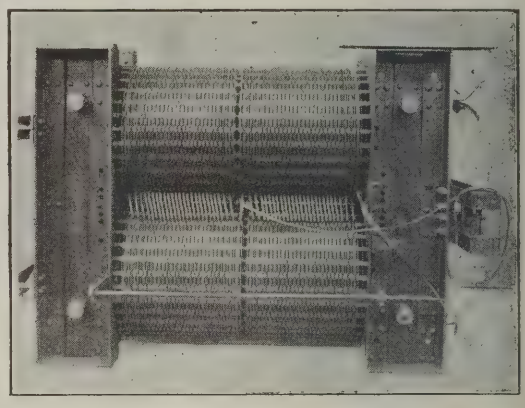

Fig. 11.—Step-up Transformer arranged for Transport.

The popularity of the electricity supply has rendered it necessary to proceed with the construction of the third dam to provide a means for increasing the load. The construction of this dam involves the laying of some 3½ miles of road, and this is now completed, and work on the dam itself commenced. Fig. 12 shows the site of this dam. A Keystone drill is working overtime testing the geological formation at the dam site, and the bush surrounding the surveyed

Fig. 12.—Site of New Dam.

district has been felled. Cottages for the use of the workmen are completed, and service buildings and a community cookhouse are in operating order. The first supplies of material for the dam are now being carried through, and excavation work on the dam site is well under way. The completion of the new dam will double

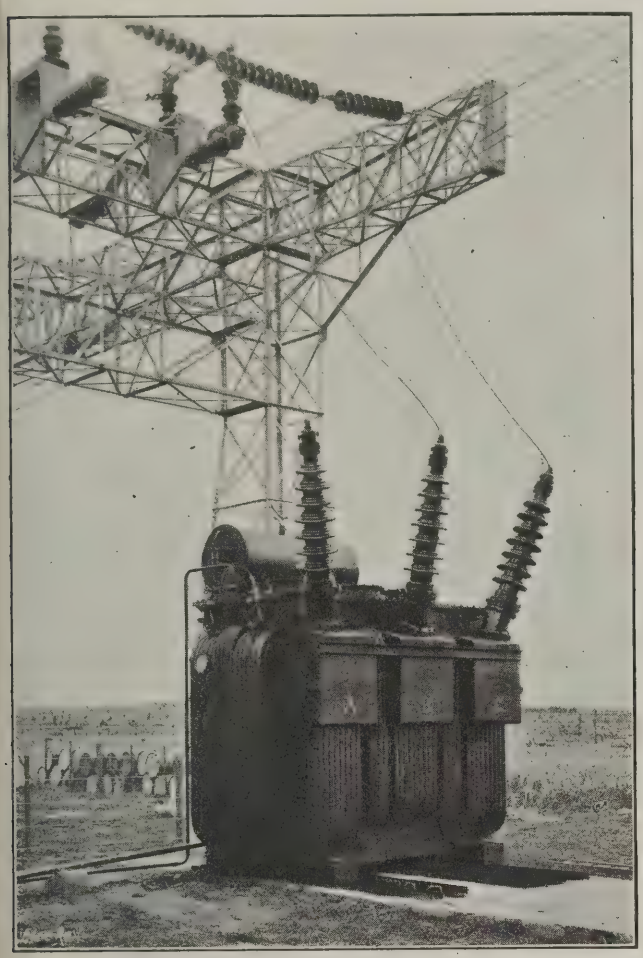

Fig. 13.—A Section of Dannevirke Sub-station.

the storage capacity of the present scheme, and make available, with some few extensions at the power house, an additional 12,000 kW, thus doubling the capacity of the station.

The transmission scheme from Mangahao is being enlarged almost daily, and the various sub-stations within its area are linking up practically every hamlet and isolated settlement within the effective radius. Already over 600 miles of transmission lines have been erected, and the total is steadily increasing.

In conclusion, we are indebted to Messrs. Ferranti, Ltd., and the Metropolitan-Vickers Electrical Co., Ltd.,

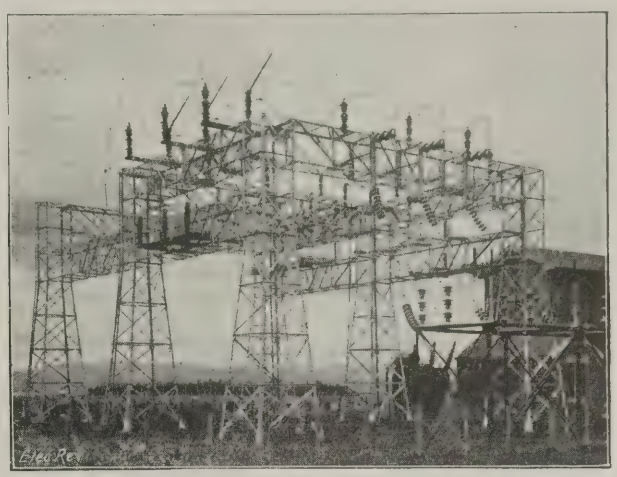

Fig. 14.—The Sub-station at Dannevirke.

for their assistance in the preparation of this article. Messrs. Ferranti supplied the step-up transformers, and

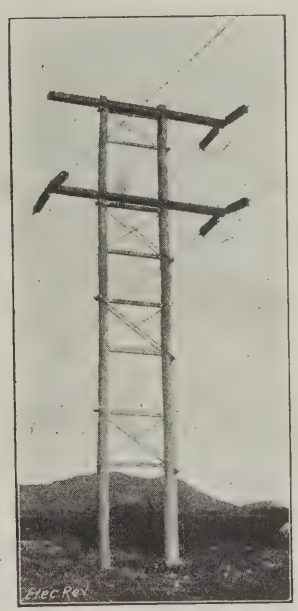

Fig. 15.—Double Pole.

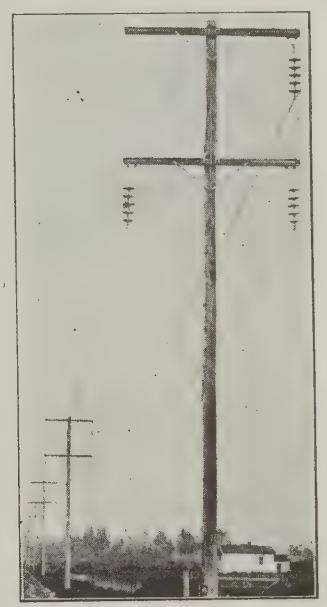

Fig. 16.—110,000-V Line.

Messrs. Metropolitan-Vickers supplied the alternators and the sub-station equipments.

The I.E.C. Meeting in America.—I.

A Cursory Account of the Proceedings.

By PHEIDIPPIDES.

On Good Friday, April 2nd, the Cunard Liner *Andania* sailed from Southampton with the following British delegates who were attending the New York meeting of the International Electrotechnical Commission:—

Col. R. E. Crompton, C.B., R.E. (Hon. Sec., I.E.C.).

Sir Archibald Denny, Bart. (Chairman, B.E.S.A.).

Sir Richard Glazebrook, K.C.B. (Chairman, British National Committee).

Mr. C. P. Sparks (Vice-Chairman, British National Committee).

Mr. C. Le Maistre, C.B.E. (General Sec., I.E.C.).

Mr. Ll. B. Atkinson (Director, Cable Makers' Assn.).

Mr. S. C. Bartholomew (General Post Office).

Mr. E. G. Batt (General Electric Co., Ltd.).

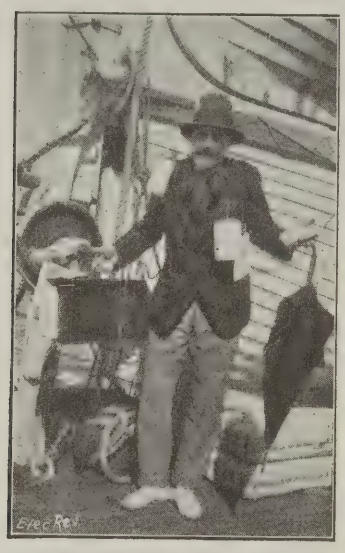
Mr. W. S. Burge (English Electric Co., Ltd.).

Capt. P. Dunsheath (W. T. Henley's Telegraph Works Co., Ltd.).

Mr. A. R. Everest (British Thomson-Houston Co., Ltd.).

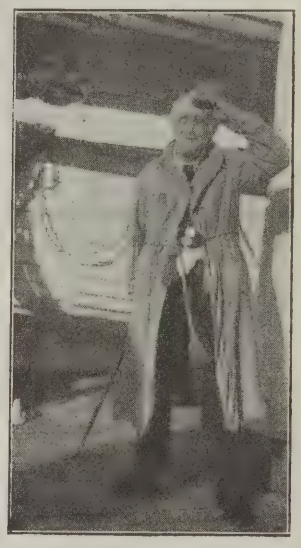
Mr. W. Lee (Silvertown Lubricants, Ltd.).

Mr. S. W. Melsom (Callender's Cable & Construction Co., Ltd.).



Dr. A. C. Michie (Electrical Research Association).

Mr. R. B. Mitchell (President, Incorporated Municipal Electrical Association).



Mr. W. S. Marshall (Shell-Mex, Ltd.).

Mr. A. P. Mossay (Electric Vehicle Committee of the U.K.).
Mr. J. S. Peck (Metropolitan-Vickers Electrical Co., Ltd.).
Mr. C. Rodgers (Secretary, British Electrical and Allied Manufacturers' Association).
Mr. T. Roles (City Electrical Engineer, Bradford).
Mr. P. F. Rowell (Secretary, Institution of Electrical Engineers).
Mr. F. Wallis (English Electric Co., Ltd.).
Lt.-Col. K. Edgcumbe (Everett, Edgcumbe & Co., Ltd.)

The British contingent, consisting of twenty-three members, was joined at Cherbourg by the representatives of twelve other countries, constituting in all upwards of ninety engineers, a veritable Electrical League of Nations.

Lt.-Col. K. Edgcumbe.

Col. R. E. Crompton.
A Fancy Dress Competition.

Mr. S. C. Bartholomew.

The various European countries represented, with the principal delegates attending are as follows:—

Austria: Herr Bretschneider (Vice-President, Austrian Standards Committee).

Belgium: M. E. Uytborck (Secretary, Belgian Electrotechnical Committee).

Czecho-Slovakia: Prof. V. List (Chairman, Czecho-Slovakia Electrotechnical and Standards Committee).

France: M. E. Roth (Société Alsacienne de Constructions Mécaniques).

Germany: Prof. Dr. P. Strecker (President, German Electrotechnical Committee).

Holland: Prof. C. Feldmann (President, Dutch Electrotechnical Committee).

Italy: Signor G. Semenza (President, I.E.C.).

Norway: Mr. E. Heiberg (Director, Norwegian Industrial Standardisation Bureau).

Poland: Mr. Roginski ((Secretary, Polish Standards Committee).

Russia: Prof. M. Châtelain (Chairman, Russian Electrotechnical Council).

Sweden: Mr. A. F. Enstrom (President, Swedish Standards Committee).

Switzerland: Mr. E. Huber-Stockar (President, Swiss Electrotechnical Committee).

It must have been a source of extreme gratification to that wonderful old man, Colonel Crompton, to move about as he did throughout the voyage with all the enthusiasm and activity of youth, among this body of world-famous engineers brought together largely through his own instrumentality. It will be remembered that the International Electrotechnical Commission owes its inception to a paper which he presented at the St. Louis Electrical Congress in 1904.

The present General Secretary, Mr. C. Le Maistre, to whose energies both in the preliminary preparations and during the voyage, it is largely due that the visit to America is proving such a great success, has also worked with the I.E.C. since its inception. As is well known, he has also been closely associated with engineering standardisation in this country through the B.E.S.A. for upwards of twenty-five years, and during that time he has materially contributed to bringing its objects to fruition.

At the close of the Congress of 1904, a resolution was adopted by the Chamber of Government Delegates to the effect that steps should be taken to secure the co-operation of the technical societies of the world by the appointment of a representative Commission to deal with electrical standardisation.

Two years later thirteen nations sent delegates to a conference in London presided over by Mr. Alexander Siemens, and the I.E.C. was then constituted on a permanently organised basis.

International meetings have been held during the past twenty years in Brussels, Turin, Cologne, Paris, Zurich, Berlin, Geneva, and The Hague, and to all these meetings the Americans have sent delegates, often in considerable numbers. It is therefore an event of great importance that after such a period of useful development the seal should be set on the Commission's active growth by the acceptance of an invitation from across the Atlantic by a body of engineers representative of all interests.

Col. Crompton and Sir Archibald Denny.

Herr Stolz, Dr. K. W. Wagner, Col. Crompton, Mr. Ll. B. Atkinson, and Mr. C. P. Sparks, ready to land.

Mr. P. F. Rowell and Prof. V. List.

On Good Friday afternoon the *Andania* steamed down the Channel in brilliant sunshine, but we were not to be let off so lightly for very long. During the night the meaning of the Atlantic swell became evident, and then the weather became worse until a strong cold head wind, amounting at times to a gale, and a rough sea, took all interest out of life for many of the delegates.

The cordial greeting received by wireless on Saturday from the American Committee had a special significance, and hearty support was given to the reply, in which all joined in the keen anticipation of setting foot on the hospitable and immovable soil of America.

On Easter Monday, the *Aquitania*, also sailing to New York, but at a much higher speed, pased us, and the usual facetious greetings were flagged across the few hundred yards that separated us. Offers to tow and threats to report for excessive speed were equally ignored, however, and she passed ahead out of sight to reach New York days before we did.

The weather continued bad, so that one evening, out of ninety stalwart delegates, only about ten faced dinner; but time brought its own cure, and by Tuesday the weakest member was sufficiently recovered to attend an informal reception by the President, Signor Guido Semenza, in the ship's lounge.

Signor Semenza apologised for not having called the meeting earlier, and hoped that as Captain of the Conference in New York, he would prove a better sailor than on the Atlantic. He explained that although no official meeting was possible in the absence of the American delegates, it was important for the various members to get together and make each other's acquaintance so that the informal exchange of views might facilitate the work of the Conference later on. The General Secretary, Mr. C. Le Maistre, then read the names of the members constituting the different committees, and Sir Archibald Denny, chairman of the oldest standardising body in the world—the British Engineering Standards Association—said a few complimentary words on the success of the I.E.C. in bringing together so many distinguished members under such a distinguished president.

In spite of the unpleasant weather encountered on the Atlantic, the voyage was made a very happy one by a series of sports and social events organised by an entertainments committee under the able presidency of Colonel Edgcumbe. The British delegates took high places in the competitions, Mr. S. C. Bartholomew scoring a great success in a fancy dress competition, of which some snapshots are reproduced herewith.

By a happy thought, the Cunard Company gave a dinner one evening in Mid-Atlantic in honour of the Electrotechnical Commission, at which speeches were made by Sir Archibald Denny and Signor Guido Semenza. There was unanimous support from all present for the sentiments expressed by both speakers with regard to the excellent service and the arrangements made for the delegates' comfort during the voyage. After the health of the chef had been drunk, and responded to by that august Frenchman in a few admirably chosen phrases, Herr Hoenig, Chairman of the Swiss Committee, supported the thanks to the ship's staff in half a dozen languages, concluding with an original witty poem in German, detailing the voyage of the good ship *Andania*, and the company adjourned to the lounge, where an excellent concert was enjoyed until a late hour. Among the first-rate musical talent aboard, the delegation was fortunate in having as a fellow passenger a well-known modern composer, and when his next song is being widely sung, many will recall how he favoured the I.E.C. with the first public performance of it, from his rough manuscript in mid-Atlantic. The gathering resulted in a handsome collection in aid of seamen's charities.

Early on Sunday morning, April 11th, the *Andania* called at Halifax, Nova Scotia, and on Tuesday, the 13th, the skyscrapers of New York towered up alongside. The European delegation had arrived.

The delegates were welcomed at the pier by a committee headed by Dr. John W. Lieb and Prof. Elihu Thomson, and were taken to the Hotel Astor, where they were quartered during the Conference, in a special fleet of motor cars decorated with the blue and white flag of the Commission.

On Tuesday evening, April 13th, an official welcome was given to the delegation at a meeting held in the auditorium of the Engineers Societies Building, under the chairmanship of Dr. Lieb, chairman of the Reception Committee. Telegrams from Mr. Thomas Edison and Lord Balfour were read, and the Secretary of Commerce, Mr. Hoover, being unable to attend as arranged, spoke a few words of welcome from his home in Washington by means of amplifiers and loud speakers in the hall. In extending the welcome of the United States Government to the members of the International Electrotechnical Commission, he said: "The subjects you are about to consider are of the first importance to the continued progress of electrical science and of industry, and I need not say that your labours and the conclusions that you reach are also of the first importance to all your respective countries and to mankind in general. If we would have the freest flow of discovery and invention in electricity we must have common terms and common standards."

Dr. Elihu Thomson, in his words of welcome, spoke of the achievements of the I.E.C. during the past quarter of a century, and then proceeded to touch upon some of the wonders which would be shown to the delegates.

Dr. Howard T. Barnes spoke on behalf of the Canadian National Committee, and was followed by Colonel Crompton, who received an enthusiastic greeting from the meeting, the entire body of delegates and guests rising and cheering him. Colonel Crompton ran over his early experience in founding the I.E.C., showing how the progress had necessitated considerable tact in bringing together opposing interests. Now, for the first time since the war, representatives of all the nations of the world, including ancient enemies (now become friends), had come together, and he believed that it was the pleasure of doing this work that kept him alive.

After Monsieur Genissieu (France), Mr. Enstrom (Sweden), Prof. List (Czecho-Slovakia), and Dr. Strecker (Germany) had spoken as representatives of the nations of Western, Northern, Eastern, and Central Europe, respectively, Signor Guido Semenza, the President of the Commission, delivered an address on the "Accomplishments and Aims of the International Electrotechnical Commission."

At a luncheon given by the United States National Committee, at the Commodore Hotel, New York, on April 14th, an able and effective speech was delivered by Dr. Michael Pupin, President of the American Institute of Electrical Engineers. As a student at college Dr. Pupin learned that the Greek philosopher said that "To know thyself is the first step to wisdom." After 40 years he had concluded that the second step to wisdom was "to know thy neighbour." "In Europe," he said, "we suffer from neighbourphobia. Everybody's afraid of his neighbours," and then he described how as a boy he lived in a simple Serbian village near the Danube where within 20 miles there were 12 villages representing five different races—Serbs, Hungarians, Germans, Slovak, and Rumanians—and yet they were the happiest people on earth. Why? Because every village had its market days, when the peasants from other villages came to trade, and when they enriched their experience by the experience of their neighbours. They welcomed one another as neighbours, and, looking at the delegates from all over the world, Dr. Pupin felt that the best greeting he could give was the old Serbian one: "Welcome, our dearly beloved neighbours."

Sir Archibald Denny, in replying on behalf of the visiting standardising bodies, referred at some length to the activities of the British Engineering Standards Association. He hoped that a hearty effort would be made during this visit to lay the foundation of an international standardising association.

Signor Semenza, in a witty speech, spoke of the great painter who explained that his best picture was due to his efforts to attain the high quality of the frame purchased for it by the man who ordered it. In the frame of welcome and entertainment provided by the Reception Committee the Commission must provide a beautiful picture in the work carried out in the technical sessions. Dr. Sharp, President of the U.S. Committee, and Dr. Mailloux, past-president of the I.E.C., also spoke.

The technical sessions of the Conference opened at 9.30 on Wednesday morning, April 14th, and continued daily, morning, afternoon and evening, until the 22nd.

D

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

New Businesses Registered.—The following businesses have recently been registered under the Business Names Act:—

N. W. J. Gorrill & Co. (radio and electrical factors), 6, Clapham Court Terrace, Kings Avenue, S.W.4.

Radio Services (radio accessories, sets and tools), 2, Winchester Street, Salisbury.

Piccadilly Sign Co. (electric signs), 22-24, Charing Cross, Whitehall, S.W.1.

South Wales Electric Lamp Service (electrical engineers), 3, Temple Buildings, Goat Street, Swansea.

Adelphi Electrical Co. (electrical engineers and contractors), St. Stephen's House, Victoria Embankment, S.W.

Aldwych Engineering Co. (general engineering supplies), 71, Lincoln's Inn Fields, W.C.2.

Northern Electric Co. (electrical contractors and wireless dealers), 292, Stratford Road, Manchester.

Rays Wireless Stores, 87a, Seven Sisters Road, Holloway, N.7.

Gordon Radio Co. (manufacture and sale of wireless apparatus), 69-73, Mansell Street, Aldgate, London.

Thrale Engineering Co. (electrical and mechanical engineering), Cromwell House, Fullwood Place, W.C.1.

I. C. Tofield & Co. (electrical engineers and representatives), 110, Dale End, Birmingham.

Unemployment.—The total number of persons registered at the exchanges as wholly unemployed on April 12th was 1,024,400. This was 25,386 less than on April 5th and 180,370 less than on April 13th, 1925.

The E.T.U. and Fusion.—The members of the Electrical Trades Union are to be consulted by means of a ballot upon the question of merging the organisation in the Transport and General Workers' Union which has already absorbed a number of trade unions.

Employment during March.—Although the general tendency of employment during March was improvement, the *Ministry of Labour Gazette* shows that this did not apply to the engineering industry in which, as a whole, there was a general decline. In the electrical engineering section unemployment increased from 6.6 to 6.7 per cent. and compared badly with the proportion of 5.5 per cent. in March, 1925. On the other hand, conditions improved in the electrical wiring and contracting industry and in electrical cable, wire and lamp manufacture. In these groups the percentages of unemployed were 7.9 and 7.4 respectively, as compared with 8.6 and 7.8 per cent. in February. Improvements also occurred in the transport section and in the gas, water, and electricity supply industries as a whole.

The Timber Market.—Our timber trade correspondent reports that the market for timber for general construction work is more healthy than it was a month ago. Although there are still large stocks on the market the consumption has shown considerable improvement, and is likely to increase in that respect provided labour troubles in the mining and engineering industries are avoided. Housebuilding is proceeding splendidly, thus creating a good demand for general wood requirements. Hardwoods for the cabinet and fancy box trade are in fair request, and at firm rates, especially teak, rosewood, and ebony. Mahogany is not quite so strong in value, comparatively, as the other descriptions mentioned, increasing supplies having arrived this year compared with the corresponding period of 1925. Taken generally, however, there is an improvement in the call for that choice wood compared with a month ago, the demand for good quality material especially being very satisfactory.

Social Event.—The first dinner of the Cambridge Instrument Co., Ltd., was held at the Hotel Russell on Saturday, April 17th, when Mr. S. W. Hersant presided over an assembly of 120. The guests of the evening included the directors of the company, Mr. R. S. Whipple, Mr. C. Mason, Mr. R. W. Paul, Mr. F. Wakeham and Mr. W. H. Apthorpe, with their ladies. The event concluded with a dance.

The L.C.C. and Foreign Purchases.—The General Purposes Committee of the London County Council reports that it has considered the difficulties which British manufacturers have to face in competing with firms in a foreign country with either a low rate of exchange or low rates of wages in operation, and whether the Council should, in dealing with tenders for articles of foreign manufacture, pay regard to the economic conditions of the country in which the articles are produced. The Committee's practice is to concur in preference being given, within limits, to British, as against foreign, tenders. It has decided that it could not advise the Council to go beyond this and to bar all tenders for goods of foreign manufacture, or to undertake the practically impossible task of assessing the relative economic factors in the countries concerned in any particular case.

Canadian Radio Exhibitions.—The *Board of Trade Journal* states that a National Canadian Radio Exhibition is to be held at Toronto from October 25th to 30th. Similar exhibitions are to be held at Winnipeg from September 13th to 19th, and at Montreal from October 4th to 9th. Inquiries should be addressed to the Canadian Exhibition Co., 204, King Street East, Toronto.

New Municipal Showrooms.—The Shoreditch Lighting Committee has recommended to the Borough Council that premises be purchased for a showroom and demonstration purposes. The total estimated expenditure will be £12,500, including alterations and equipment.

E.D.A. Activities.—We have received another batch of pamphlets from the British Electrical Development Association. They maintain the E.D.A. traditions of "readability," effective argument, and attractiveness, and should prove useful to supply authorities and others engaged in increasing the load. The new publications deal with the domestic applications of electricity, electric vehicles, and electricity for power purposes. Accompanying the leaflets is a short pronouncement upon the multi-part tariff system received from the State Electricity Commission of Victoria.

Local Exhibitions.—St. Helens.—At the recent electrical exhibition organised by the Corporation Electricity Department, the General Electric Co., Ltd., had a very attractive display. A range of "Magnet" domestic electrical appliances were exhibited and demonstrated, and included a refrigerator, cooker, wash-boiler, egg whisks and other appliances. A section of the G.E.C. stand, illustrated in the picture herewith, was made up in the form of shop windows, and the space, dressed by local retailers, was used to demonstrate the "Gecoray" system of shop-window lighting. The general lighting of the rest of the stand was very effective.

The G.E.C. Stand at St. Helens.

Proposed Tasmanian Hydro-Electric Grant.—After an investigation carried out at the request of Mr. Bruce, the Australian Prime Minister, Sir Nicholas Lockyer has issued a long report on Tasmanian disabilities as a result of federation, containing a number of recommendations. Among these is a proposal that the Commonwealth Government should make a grant of half a million pounds to relieve Tasmania of a portion of the capital cost of the hydro-electric scheme in consideration of the State's assistance in having established an electrolytic zinc industry.—*Reuter* (Melbourne).

Electrical Imports of the Philippines.—Mr. T. Harrington, British Consul-General at Manila, has forwarded a report on the commercial and economic situation of the Philippine Islands, to June, 1925, to the Department of Overseas Trade (Stationery Office, 9d. net). This shows that the total value of electrical machinery imported during 1924 was £481,807, as compared with £247,071 in 1923, the proportion of the total imports thus rising from 1 to 2 per cent. As was the case in most other commodities the United States was pre-eminently the principal supplier contributing goods to the value of £438,974 in 1924, Great Britain's share being only £2,421.

Hours of Work in Australia.—The N.S.W. High Court, on April 19th, upheld the appeal of three New South Wales firms against the judgment of a magistrate that employés working under the Federal 48-hour week award were entitled to full wages for 44 hours' work, under the State Act. The Court decided that the 44-hour week was not applicable to employés in industries covered by the Federal award. The employers are reported to be gratified at the Court's decision and anticipate a period of greater prosperity in the industrial world. The Trades Unions are disappointed. Fifty thousand workers are affected and 2,000 employés of the Clyde Engineering Company downed tools for a day as a protest.—*Reuter* (Sydney).

The Chinese Attitude.—A writer in the February *Journal* of the Associated Chambers of Commerce in China and Hongkong deals with the age-long exclusiveness of the Chinese and their antipathy to foreign ideas and products. He considers that all indications point to an augmentation of this sentiment in recent years, and that the result will be a constant endeavour to impose heavy tariffs upon foreign goods to protect and foster native industries. "The tendency will be towards the exclusion of all foreign things. China for the Chinese and all goods to be supplied by the country itself is the tendency of the Chinese mind; the traditional spirit of exclusion will be carried out in all departments of life."

Threatened Tramway Strike at Manchester.—At a meeting of the employés of the Manchester Tramway Department, last week, it was decided to cease work on Whit Monday and three succeeding days as a protest against the refusal of the City Council to grant the men an extra four days' holiday. They already receive eight days per annum.

Trade Announcements.—Mr. S. Whiston, late with Carrington & Button, has commenced business as an electrical engineer at 12, West Street, Crewe.

The Wenham Lighting Corporation, Ltd., of 184, Gray's Inn Road, the whole of the share capital of which is held by the Whitworth Electric Lamp Co., Ltd., has acquired the business of the Dawson Electric Co., St. Peter's Church Walk, Nottingham, and it will conduct this business as a branch. Mr. A. E. Dawson, formerly proprietor, has been appointed managing director to the Wenham Lighting Corporation, Ltd., and he will manage both businesses from 184, Gray's Inn Road, W.C.1.

Messrs. R. A. Evans, Ltd., of Leicester, have opened a district office at 46, Grosvenor Chambers, Deansgate, Manchester ('Phone: "City 4550"), under the direction of Mr. E. Grayson Holt, to deal with business in the Lancashire and Yorkshire area.

Mr. S. D. Schofield has removed from Penistone to Bolton, and his address is now: Engineer Representative, Holophane, Ltd., 23, Yarrow Place, Bolton.

Lead.—Reporting on April 24th, Messrs. James Forster and Co. stated:—"The demand from cable makers is still very disappointing. . . . The key of the position seems to lie with Germany. As long as this market is used for the dumping ground of surplus lead from the Continent, so long will the price remain depressed. When the Continent resumes taking its normal quantities, the position will be quickly relieved here, and if this were to coincide with better buying by cable makers, we should quickly see the price over £30 per ton again."

Catalogues and Lists.—Messrs. Mavor & Coulson, Ltd., 47, Broad Street, Mile End, Glasgow.—Price List 391/1, giving particulars of lighting fittings for mining service. Fully illustrated.

Messrs. J. A. Crabtree & Co., Ltd., Lincoln Works, Walsall.—Folder No. 1010, illustrating and describing the "Single Cord" ceiling switch. Priced.

The Eagle Engineering Co., Ltd., Eagle Works, Warwick.—A price list of electrical accessories, fittings, switchgear, &c.

Houghton-Butcher (Great Britain), Ltd., High Holborn, W.C.1.—"Houghton's Radio News," containing illustrated and priced details of radio apparatus of all makes. Articles on window-dressing and other sales subjects appear.

Messrs. F. V. Collins & Co., 155, Kingston Road, Wimbledon, S.W.19.—A card advertising the "Newlink" solderless connector for radio work. Priced.

Electradix Radios, 218, Upper Thames Street, E.C.4.—An illustrated and priced catalogue of radio apparatus and electrical appliances.

Metropolitan-Vickers Electrical Co., Ltd., Trafford Park, Manchester.—A number of illustrated catalogue sheets, dealing with many examples of the company's manufactures, superseding lists previously published.

Messrs. de Leeuw & Co., Ltd., Sentinel House, Southampton Row, W.C.2.—A reprint of an article dealing with Freed-Eisemann radio apparatus.

Messrs. Edward Deane & Beal, Ltd., 3, Monument Street, London Bridge, E.C.3.—A brochure illustrating and describing "Consummate" evaporative condensing plant.

Trelleborg Ebonite Works, Ltd., Audrey House, Ely Place, E.C.1.—A showcard advertising the company's ebonite sheet, tubes, rods, &c., and a price list of ebonite panels.

Messrs. Ferranti, Ltd., Hollinwood, Lancs.—A series of illustrated pamphlets, giving full details of the company's cable boxes of many types, mainly for use with oil-immersed transformers.

Fuller's United Electric Works, Ltd., Woodland Works, Chadwell Heath, Essex.—Lists 260 and 261, giving prices and particulars of "Sparta" low- and high-pressure batteries for radio work.

Messrs. Campbell & Isherwood, Ltd., Raleigh Street, Bootle, Lancs.—An illustrated pamphlet advertising portable electric grinders and hand drills.

Messrs. Donovan & Co., 47, Cornwall Street, Birmingham.—A priced and illustrated pamphlet dealing with the Philips rectifier for battery charging.

The English Electric Co., Ltd., Queen's House, Kingsway, W.C.2.—A well-produced illustrated brochure describing twelve 12,500-kVA, 110,000-V transformers supplied to the Tata Power Co., India.

Metro-Vick Supplies, Ltd., Trafford Park, Manchester.—A well-illustrated, priced catalogue of "Silverstone" lighting glassware, including bowls, shades, &c.

Orion Lamps, Ltd., 15, Eldon Street, E.C.2.—A price list of "Orion" vacuum and gasfilled lamps of several types.

Messrs. J. W. Brooke & Co., Ltd., Adrian Works, Lowestoft.—A pamphlet advertising the "Brooke" 40/60-h.p. marine engine.

Higgs Motors, Witton, Birmingham.—A stock list of a.c. and d.c. motors of all sizes and patterns.

Messrs. Crompton & Co., Ltd., Chelmsford.—An illustrated booklet describing the construction and uses of the "Alltest" d.c. instrument, which can be employed as a voltmeter, ammeter, resistance indicator, &c.

The Standard Spring Co., Bank Street, Hall End, West Bromwich.—A folder illustrating various patterns of springs made by the firm.

Book Notices.—"The Anglo-American Year Book, 1926." (Pp. 504.) London: American Chamber of Commerce in London. Price 15s. net.—This year book is a mine of interesting facts and figures for those who desire to foster Anglo-American relationships. A number of special articles appear in the 1926 edition, including two on legal matters from the English and American points of view. Mr. Nutting, of the American Consulate-General, contributes statistics of trade between the two countries during 1925.

"Kelly's Directory of the Electrical Industry, Wireless and Allied Trades." (Pp. xxvi + 1,256.) London: Kelly's Directories, Ltd. Price 30s. post free.—This, the third, edition of the directory has been thoroughly revised—no light task in view of the continuing expansion of the industries covered. The body of the volume consists of a county directory, the towns being arranged under their counties in alphabetical order. The names of contractors, &c., and other details, are given. In addition to this there are alphabetical and classified lists of electrical firms; a directory of supply undertakings; and a list of trade names. It is of interest to note that the volume contains the names, &c., of 4,500 radio retailers.

"Post Office Electrical Engineers' *Journal*." Vol. XIX. April, 1926. London: Electrical Review, Ltd. Price 1s. 6d. net.

"The Mining Electrical Engineer." Vol. VI, No. 67, April, 1926. Price 1s. net.

"*Proceedings* of the Rugby Engineering Society." Vol. XIX, Session 1924-5. Published by the Society. Price 10s. 6d.—The total membership of the Society at the end of the year in question was 367, as compared with 346 for the previous year. The revenue for the year was £255, resulting in a balance of £18.

Bankruptcy Proceedings.—M. D. Rosenbloom (trading as D. Rose & Co.), electrical engineer, 25, Osborn Street, London.—An application was made on April 20th to Mr. Registrar Mellor, at the London Bankruptcy Court, for an order of discharge on behalf of this bankrupt, who failed in January, 1924. Mr. V. Armstrong, Official Receiver, reported that the liabilities amounted to £3,657; the assets, valued at £515, had realised £342, and a first and final dividend of 1s. 1d. in the £ had been paid. Born in Russia, the bankrupt came to this country in 1898 and had not been naturalised. He commenced business in 1904 and was successful until 1923, when an action was brought against him for the infringement of electric lamp patents. Following a private meeting of creditors a deed of assignment was executed, but the bankruptcy proceedings supervened on a creditor's petition. The application was opposed by the Official Receiver on the grounds (1) insufficiency of assets to equal 10s. in the £ on the amount of the liabilities; (2) omission to keep proper books of account; (3) trading with knowledge of insolvency; (4) failure to account satisfactorily for the deficiency in assets to meet the liabilities; and (5) misconduct in relation to the supply of accounts and non-attendance as often as required on the Official Receiver and the trustee. His Honour suspended the discharge for three years.

G. R. Sparrow, 11, Cloudesdale Road, Balham, late of Brixton, electrical engineer.—The receiving order in this matter was made recently on debtor's own petition. The statement of affairs shows liabilities of £492, against assets of £11, leaving a deficiency of £481. Debtor attributes his failure to unemployment and illness. In 1921, with £30 capital, he commenced business in partnership with his son and another at Beer Lane, E.C., as electrical engineers and contractors. The business was successful until March, 1922, when illness kept him away. Upon his return, he found that the business had declined and creditors were pressing. A meeting of creditors was held in July, 1922, but no action was taken, and the landlord subsequently sold the stock for rent, and the business ceased.

Thomas Barton, electrical engineer, formerly carrying on business at Ainsworth Street, Blackburn.—This debtor applied for his discharge at Blackburn County Court, on April 19th. The Official Receiver said that a first dividend of 15s. in the £ had been paid, and a further dividend was probable. Bankrupt's conduct had been very satisfactory. Judge Bradley said that Mr. Barton's conduct had been estimable in every respect. He granted an immediate discharge.

C. J. Nichols (C. J. Nichols & Co.), 7, Park Street, Bridgend.—First meeting, April 30th. Public examination May 14th, at the County Court, Bridgend.

W. C. Rhodes (L. J. Palmer & Co.), electrical engineer and contractor, 141, Newspaper House, Corporation Street, Birmingham.—Last day for proofs for dividend, May 6th. Trustee, Mr. C. Hoult, Official Receiver, 191, Corporation Street, Birmingham.

J. McFadden, electrician, 177, Higher Hillgate, Stockport.—First meeting April 30th, at the Official Receiver's Office, Byrom Street, Manchester. Public examination June 1st, at the Court House, Stockport.

Company Liquidations.—Radio Equipment Co., Ltd., 5, Dyers Buildings, Holborn, E.C.—Under a compulsory winding-up order made against this company on March 2nd, upon the petition of a creditor, the statutory first meetings of the creditors and shareholders were held on April 20th, at Carey Street. The Official Receiver reported that accounts had been lodged showing unsecured debts £5,575; preferential claims £31, and loans on debtors' bonds, £979; assets valued at £314, and a total deficiency of £6,273 with regard to contributories, the issued capital being two £1 shares. The company was formed as a private company in July, 1922, with a nominal capital of £100, to carry on business as manufacturers of and dealers in wireless equipment and primarily to act as selling agents for radio goods to John Hall & Co., of Birmingham. The promoter was Mr. P. J. White, and the failure of the company was attributed to increasing difficulties in competing with foreign manufacturers, by reason of which the margin of profit was too small; also to insufficiency of capital to enable the company to advertise adequately. The chairman added that he had collected approximately £30 from the assets and was unable to say whether anything like the estimate of £314 would be realised. A liquidator was appointed.

Hawk Coil Co., Ltd., wireless manufacturers, St. Mary's Road, Surbiton.—The creditors were called together on April 20th at the offices of Mr. F. Bryant, 16, Clapham Junction Station Approach, S.W., who stated that he had been appointed to act as the liquidator in the voluntary liquidation of the company. A statement of affairs was presented which disclosed liabilities of £1,582, all due to unsecured creditors, and net assets of £135, leaving a deficiency of £1,447. The Liquidator stated that the company was incorporated in May last with a nominal capital of £1,500, of which £1,255 had been issued. Of the latter amount £750 represented the purchase consideration for the business taken over, and the balance was cash. The turnover since the incorporation had been about £2,400, and there had been a loss on the trading of over £500. In January last the coil which the company made was greatly improved, and it necessitated the existing stock being broken up. The patent was estimated to be of no value. It was decided that the voluntary liquidation should be continued with Mr. Bryant as liquidator with a committee of inspection. The following are creditors:—

	£		£
Bankers	204	Spears & Co.	54
Ankh Insulator Co. ...	80	Solidite Mfg. Co., Ltd. ...	35

Phillipson's Press, Ltd. ...	212		

A. Emanuel & Sons, Ltd., George Street, Manchester Square, W., electrical engineers, &c.—A meeting of creditors was held on April 22nd at Andertons Hotel, Fleet Street, E.C., when the representative of Messrs. Walkers, Parker & Co., Ltd., London, the largest trade creditors, was elected to the chair. The chairman said that the firm was a very old-established one, and had always enjoyed a good reputation. All were sorry that it had come down. Mr. Walter Boniface, the receiver for the debenture holders, and the liquidator in the voluntary liquidation of the company, presented a statement of affairs, which showed liabilities of £17,920, all due to trade creditors. In addition, there were fully secured creditors for £30,360, against which they held security valued at £51,460, leaving a surplus of £21,100. The bank was creditor for £14,677, and held debentures for £15,000. The net assets were £57,066, leaving a surplus of £39,146 as regarded the creditors. The liquidator reported that the company was incorporated in 1885 with a nominal capital of £58,500, which was increased in 1889 to £100,000. The issued capital amounted to £83,500. The company was formed for the purpose of acquiring the business previously carried on by Mr. Abraham Emanuel, who became the sole director, and he also appointed his son, Mr. Elliott Emanuel, to be a director. Mr. Abraham Emanuel died in 1894, and Mr. Elliott Emanuel in 1904. Since that time there had been various changes in the directorate, and the present directors were Mr. A. Emanuel, Mr. T. Rose, Mr. D. R. Fraser, and Mr. O. G. Cooper. Mr. Alfred Emanuel was the managing director. The fees of the directors were limited to £100 per annum each, but they had been engaged in other capacities in the company and had received salaries. The balance sheet at December 31st, 1920, showed surplus assets of £10,769. The sum of £18,190 was written off as loss for the year 1921, and there was a reserve to carry forward to 1922 of £15,273. The year 1922 resulted in a further loss of £16,590, so that there was on January 1st, 1923, an adverse balance of £1,317, and further losses were incurred as follows: 1923, £10,583; 1924, £1,847; and 1925, £6,555, making a total of £20,302 to December 31st, 1925. The directors attributed the loss in 1921 to a big drop in the turnover following the "boom" year of 1920. They stated that the losses incurred in 1922 and 1923, were largely accounted for by a drastic writing down of stocks in addition to reduction in selling prices. In order to provide working capital, debentures were issued from time to time, and in July, 1922, there were in existence first debentures for £5,000 and second debentures for £25,000. The latter were held by the bank to secure an overdraft of £24,150. An advance of £30,000 was later obtained. The overdraft to the bank had been repaid, and the first debenture of £5,000 was paid off. Further funds being required to carry on the business, first debentures were issued for £6,000, £4,000, and £5,000 to the bank. The directors were unable to repay the bank, and on March 17th last the bank appointed Mr. Boniface as receiver. The latter immediately consulted the largest creditors, and it was decided that voluntary liquidation should take place. Accordingly, the necessary resolutions were passed by the shareholders on April 7th last.

Mr. W. Baker, of the Wholesale Traders' Association, said that this was one of the few cases met with at the present time where there was a substantial surplus of assets, and there was every prospect of the creditors receiving payment in full. He suggested that the voluntary liquidation of the company should be continued. It was unanimously resolved that the voluntary liquidation should be confirmed, with Mr. Boniface as liquidator, whilst an advisory committee was appointed consisting of the representatives of Messrs. Stewarts and Lloyds, Ltd., and the Armorduct Cable Co.

East Anglian Electricity, Ltd.—A meeting of members is called for May 26th, at the Great White Horse Hotel, Tavern Street, Ipswich, to hear an account of the winding up from the Liquidator, Mr. C. P. Dawes.

Northern Radio Co., Ltd.—A meeting of members will be held at 12a, Hyde Street, W.C., on May 26th, to hear an account of the winding up from the Liquidators, Messrs. W. A. Appleton and W. L. Sibley.

H. E. Davis, Ltd.—A petition for the winding up of this company has been presented to the High Court by Messrs. Albert Lee & Co. (1923), Ltd., creditors, of 8 & 9, New Zealand Avenue, E.C., and will be heard in London on May 4th.

British Wireless Supply Co. (1924), Ltd.—A petition for the winding up of this company has been presented to the County Court of Yorkshire by Messrs. Ellison & Hillman, radio factors, 123, Albion Street, Leeds, and will be heard at the County Court, Leeds, on May 4th.

Roto Sign Co., Ltd.—Winding up voluntarily. Liquidator, Mr. W. A. Prestage, Albion House, Westminster, S.W.1. Meeting of creditors May 6th, at Albion House. Particulars of claims to the Liquidator by May 24th.

Potteries Radio Co., Ltd.—Winding up voluntarily. Liquidator, Mr. F. O. Wilson, 36, Spring Gardens, Manchester. Meeting of creditors May 3rd, at the offices of the Liquidator (This notice is formal; all creditors will be paid in full.)

Henley Engineering Co., Ltd.—Winding up order made by the High Court on April 15th.

Dissolution of Partnership.—Kelsall & Co., electrical and mechanical engineers, Glanyllyn, Taff's Well, Glamorgan.—Messrs. J. Kelsall and J. J. Croft have dissolved partnership. Mr. Kelsall will attend to debts and continue the business under the same style.

Private Arrangements.—H. Brear, electrician, Calder Wharfe Mills, Ravensthorpe, Dewsbury.—A meeting of creditors was held recently, when a statement of affairs was submitted which showed liabilities of £962, of which £472 was due to the trade and £490 to cash creditors. There was also a fully secured creditor for £147, who held securities valued at £167. The net assets were £530, leaving a deficiency of £432. The business has been in existence for many years. During 1923, 1924 and 1925, there were losses on the trading of £248, £161, and £319 respectively. Since December, 1925, there was a loss on the trading of £100. The accounts at November 30th, 1924, showed a capital of £168, and the debtor was of the opinion that his assets were worth considerably more than the amount shown in the statement. An offer was made of a composition of 10s. in the £, payable by two instalments, the last to be secured. It was agreed to accept this provided

that a satisfactory guarantee was forthcoming, failing which a deed of assignment will be executed to Mr. Walker, of Messrs. W. Dawson & Son, accountants, Bank Chambers, Dewsbury. A committee was also appointed. The following are creditors :—

	£		£
Austin, J., & Sons, Ltd.	40	Scattergood & Johnson	120
Metropolitan - Vickers Electrical Co., Ltd.	30	Taylor, J., & Son	25
		Tungstalite, Ltd.	34

Raymond Palmer, trading as the Electrical Supply Stores, electrical and wireless dealer, Crown Street, Halifax.—The creditors of the above were called together on April 23rd, at Bradford, when a statement of affairs was submitted which showed ranking liabilities of £3,492, all were £2,383, leaving a deficiency of £1,109. It was stated that the debtor left the Army in April, 1919, and two years later started trading as a wireless dealer from a private house. It was stated that accounts had been prepared from time to time, and in June, 1923, debtor's capital was £193, whilst by June, 1925, it had increased to practically £500. During the 21 months ended June, 1925, there was a profit on the trading of £750, whilst the drawings were £450. Since July 1st of last year there had been a loss on the trading of £700. It was stated that, in addition to the assets shown, the debtor possessed an equity in a house and other small items. A resolution was passed in favour of the execution of a deed of assignment with Mr. C. H. Baker, C.A., Standard Buildings, City Square, Leeds, as trustee, together with a committee consisting of Mr. P. S. Booth and the representatives of Messrs. Louin & Murray, E. Robertshaw & Co., Siemens Bros. & Co., Ltd., and the General Electric Co., Ltd. The principal creditors are :—

	£		£
Frenhal, D., Ltd.	64	Ward & Goldstone, Ltd. ...	58
General Electric Co., Ltd. ...	280	Baxendale & Co., Ltd.	66
Louin & Murray	163	Beardsall & Co., Ltd.	170
Robertshaw, E., & Co.	357	B.N.B. Wireless Co.	163
Siemens Bros. & Co., Ltd. ...	91	Brown Bros., Ltd.	55
Siemens & English Electric Lamp Co., Ltd.	97	Sellars, H. W., & Co.	190

For Sale.—The Superintending Engineer, N.W. District, W. & B., Department of the R.A.F., Uxbridge, invites offers for an electrically-driven pumping set. Yorkshire (West Riding) Electric Tramways Co., Ltd., has for disposal two 320-h.p. Diesel engines, coupled to two Dick, Kerr 200-kW generators, one 264-cell Tudor battery, one reversible booster, and one 10-ton overhead travelling crane. Mr. S. E. Buckley, of Oakmere Farm, Potter's Bar, invites offers for a 30-gallon National calorifier and boiler, &c. (See our advertisement pages to-day.)

Deed of Assignment.—M. Martin (D.B.M. Electrical Co.), 23, The Royal Arcade, and 32, West Street, Weston-super-Mare.—Particulars of claims to the Liquidator, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C., by May 11th.

New Czecho-Slovakian Company.—A new company has lately been formed at Aussig with a capital of 2½ million crowns and the title of the Bohmische Glühlampenfabrik Gesellschaft, to acquire and extend the Plechatry incandescent lamp works near that town.

New French Companies.—La Société des Etablissements S.N.A.P. is the name of a new company which has lately been formed in Paris with a capital of one million francs to manufacture radio apparatus.

La Société Secteur Electrique de Domme is the name of a new company which has lately been formed at Domme with a capital of 2¾ million francs to supply electricity in the Department of Dordogne.

New Italian Companies.—Among the new hydro-electric undertakings recently formed in Italy are the Società Idroelettrica del Vizze, Milan, capital 120,000 lire; the Società Idroelettrica Sile, Treviso, 100,000 lire; La Società Idroelettrica Pontecorvo, 50,000 lire; La Società Idroelettrica Dolomiti, Rome, 1,000,000 lire; and La Società Idroelettrica Val d'Enza, Reggio Emilia, 20,000 lire.

The concerns recently organised in connection with the radio industry include the Società Brunet, Milan, capital 500,000 lire; and La Società Radio Elettro-Meccanica Bruno Biancoli & Co., Bologna, capital 300,000 lire.

La Società Elettro Ferrovia Trentina has lately been formed in Milan with a capital of 100,000 lire to construct an electric railway in the Trentina district.

Irish Free State Electrical Imports.—The imports of electrical goods, excluding machinery, into the Irish Free State during February last were valued at £38,715, bringing the total for the first two months of the year to £91,122, as compared with only £46,407 in the corresponding period of 1925.

Brazilian Railway Electrification.—The British Engineers' Association reports the receipt of complete data comprising plans, details of rolling stock, permanent way, traffic reports, &c., relative to the proposed electrification of the first section of the Sorocabana Railway, Brazil, tenders for which will shortly be called for. This important undertaking covers the section between Sao Paulo and Santo Antonio, a distance of 152 km., and present indications are that over 50 locomotives will be required. The electric power will be supplied by the Sao Paulo Tramway, Light & Power Co., and associated companies.

French Thomson-Houston Developments.—It is reported from Paris that the Société Thomson-Houston has transferred its telephone branch to the International Telephone and Telegraph Corporation. A few months ago the former established a subsidiary company to work its telephone branch, one half of the capital being issued to the International Corporation for the sum of $2,000,000. Now the French company has ceded to the International Corporation the second half of the capital for an amount exceeding $3,000,000, or about 100,000,000 fr. It is stated that the telephone branch has never yielded any profits to the French company.

Polish Foreign Electrical Trade.—The *Board of Trade Journal* publishes statistics showing that during February last Poland imported apparatus, conductors, and other electro-technical materials to the value of 1,435,000 zloty (£35,000). The exports of similar goods were valued at 57,000 zloty (£1,400).

Lighting and Power Notes.

Australia.—New South Wales.—According to the *Australasian Electrical Times*, Mr. H. G. Carter, chief electrical engineer, N.S.W. Department of Public Works, has submitted an important report to the Government on the power resources of the State. The State was divided into three districts for purposes of the survey: The northern district, from the Manning River to the Queensland border; the central district, between the Manning River and an east-west line through Kiama; and the southern district, between the Kiama line and the Victorian border. Large central stations would serve each district, and the networks serving the latter would be gradually interconnected. In the central district, 12,000 million tons of coal can be made available, but water power resources are small—not more than 25,000 h.p. The question of circulating water will govern the possibilities of building inland fuel-fired stations. In the southern district 500,000 h.p. of the total of 700,000 h.p. of the State's water-power resources are located, and there is little coal. In the northern area there are considerable resources of both fuel and water power. In developing the State's resources, Mr. Carter says, coal will play as large a part as, if not larger than water power.

Aylesbury.—Loan Sanctioned.—The Town Council has received sanction to loans of £40,000 for mains and services, and £4,000 for sub-station equipment and kiosks.

Barking Town.—Electricity in Bulk.—The Urban District Council has completed arrangements for obtaining a bulk supply from the power station of the County of London Electric Supply Co., Ltd., at Creeksmouth, which it is anticipated will be available toward the end of June, upon which the Council's generating station will be closed down. The taking of this bulk supply has necessitated the erection of a new transformer station adjacent to the present generating station.

Barnes.—New Plant.—The London and Home Counties Joint Electricity Authority has notified the Urban District Council that it has recommended the Electricity Commissioners to sanction the extension of the Council's power station by the installation of a 3,000-kW set.

Bexhill.—Shop-Window Lighting.—The Electricity Committee has recommended the following terms for electricity supply for shop-window lighting :—(*a*) A two years' agreement to be entered into with persons concerned, supply to be limited to the period 7 p.m. to 10 p.m. (*b*) Price proposed, 2d. per kWh, plus meter rent of 1s. per quarter.

Bradford.—Electric Cookers.—The Corporation Electricity Committee has decided to introduce a scheme for letting out electric cookers on hire. The charge for large cookers will be 12s. 6d. per quarter, and for small cookers, 10s. These charges will include the cost of wiring, which will be done by local contractors. The charge for energy for cooking will be ½d. per kWh.

Brazil.—Sao Paulo.—The Sao Paulo Tramway, Light and Power Company has been granted the right of utilising rivers and land in the municipalities of Sao Paulo, Sao Bernardo, Santo Armaro, Itapecirica, Una, Conceiçao de Itanhaen, Mogy das Cruzes, Sallesopolis and Santos for developing hydro-electric energy, and extending power transmission lines to the City of Sao Paulo and to any other city for which the company has obtained a concession. It is hoped that when these new works are completed the company will be able to meet the demands of the City of Sao Paulo and the neighbouring towns.

Canada.—Bathurst, N.B.—At the coming session of the New Brunswick Legislature, authority will be sought to increase the hydro-electric plant of the Bathurst Company to 20,000 continuous h.p. At the present time the company's power plant on the Nepisiquia river is capable of developing 10,000 h.p.

Chesterfield.—Price Reductions.—The Town Council has reduced the charge for electricity for lighting to 4d. per kWh. Meter rents for heating and cooking have been abolished.

Continental. — ITALY. — The Società Idroelettrica Ligure Meridionale has secured a concession to establish a hydro-electric power station with a capacity of 17,354 h.p. to utilise the water power of the River Calore, near Montella. The Società Idrolettrica del Isares has also secured powers to utilise the River Isares, near Cardano, to develop 152,700 h.p.

SWITZERLAND.—The St. Gall-Appenzell Power Co. has decided to erect a large new hydro-electric station at Limmern at an estimated cost of £2,040,000.

BELGIUM.—The Société du Chemin de Fer Electrique d'Ostende-Blankenberg et Extensions, in its report for last year states that the plant at its power station at Slykens has recently been extended and now comprises four steam turbo-generators with a total capacity of 14,000 kW. In addition to furnishing the power for its light railways, the company is now supplying electricity for lighting and power purposes throughout the war-devastated area of Western Flanders. In order to maintain an uninterrupted supply a connection has lately been made with the distribution system of the Société des Centrales Electriques des Flandres which has power stations at Langerbrugge and Zeebrugge.

JUGO-SLAVIA.—Plans are being prepared for the construction of a power station to be erected at Varvariu in Central Serbia.

FRANCE.—La Société des Forces Motrices de la Valée d'Aspe has secured a concession to establish two 80,000-V transmission lines between Pau and Bedous.

The Société de l'Energie Electrique Alpine, of Gap, has secured a concession to establish a hydro-electric power station to utilise certain falls near Saulec in the Hautes Alpes Department.

Dover.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £3,000 for services.

East Ham.—LOANS.—The Electricity Committee has obtained sanction to the borrowing of £10,500 for mains and switchgear. The committee is applying for sanction to loans of £5,000 for machinery at the power station, and £14,600 for feeder cables to Manor Park sub-station.

Ecuador.—GUAYAQUIL.—The municipality has concluded a contract with the Guayaquil Electric Light Co., to provide an electric lighting service for twenty years. A hydro-electric plant will be constructed near Bucay. All equipment will be purchased abroad.—*Reuter's Trade Service* (Guayaquil).

Faversham.—LOAN.—The Town Council has applied for sanction to a loan of £2,400 for cable renewals.

Finchley.—LOAN.—The Electricity Committee is seeking sanction to a loan of £29,000 for plant and sub-stations.

Fleetwood.—NEW PLANT.—The Mid-Lancashire Electricity Board has considered the application of the Town Council for sanction to carry out electricity extensions, and has approved the proposal to spend £31,000 on the installation of additional machinery instead of taking a bulk supply from the new Ribble station at Preston.

Gravesend.—INQUIRY.—Col. Ekin held an inquiry on April 22nd, into the application of the Corporation for power to supply electricity in the parishes of Darenth, Fawkham, Hartley, Horton Kirby, Longfield, Southfleet, Stone, Swanscombe, Chalk, Denton, Ifield, Meopham, Nursted, and Cobham. Mr. R. M. Montgomery, K.C., who appeared for the Corporation and the Dartford Urban District Council, said that it was proposed that the charges for electricity in the added districts should be the same as at Gravesend. With regard to the Kent Electric Power Co., Ltd., and the West Kent Electric Power Co., Ltd., he said that they had done nothing in the area named for over 20 years, and only laid down mains after the Corporation had given notice of its intention to apply for an Order. They had had applications for supply from Greenhithe, Swanscombe, Meopham, and Denton. There was opposition by the Kent Electric Power Co., Ltd., and the County of London Electric Supply Co., Ltd., and on behalf of the former Mr. Craig Henderson, K.C., stated that the Company had a sub-station in Swanscombe, and mains were laid for supply in that area and also at Cobham and Meopham. It had spent more than half a million in developments.

Harrogate.—LOAN.—The Town Council has applied for sanction to a loan of £44,000 for electricity purposes in place of £21,281 already applied for

Hull.—ELECTRICITY SUPPLY.—The Beverley and Cottingham local authorities have applied to the Corporation for a supply of electricity, the former stipulating that the charge to consumers must not be more than 40 per cent. above that to consumers in Hull. The Corporation Electricity Committee is to consider the applications.

Irish Free State.—LETTERKENNY (Co. DONEGAL).—The Donegal Mental Hospital Management Committee is installing new electric lighting plant at a cost of £1,420.

Japan.—SHINANO-KAWA POWER STATION.—The Shinyetsu Denryoku K. K. has received the sanction of the Government to the erection of its Shinano-kawa power station, which will have a capacity of 166,000 kW. The work of construction will commence this year, and be completed in four years. The cost is estimated at 90,000,000 yen.

Llantarnam.—INQUIRY DECISION.—In connection with the inquiry held in November last by the Electricity Commissioners into the rival applications of the South Wales Electrical Power Co., and the Urban District Council, for powers to supply electricity in the Llantarnam and Llanfrechfa Upper districts, the Commissioners have granted the Council's Order, and rejected the company's application in so far as its relates to Llantarnam.

London.—SHOREDITCH.—The Lighting Committee has recommended to the Borough Council a scheme for wiring small houses for lighting only, except that a special adaptor will be fitted for an electric iron or other small domestic appliance. The scheme will apply only to houses in streets where mains are already or will be laid, and electricity will be charged for at the ordinary flat rate for lighting, plus 1½d. per kWh for rental Payment will be made through prepayment meters. It is proposed to set aside £500 in the estimates for the current year for this purpose.

HACKNEY.—The Electricity Committee has recommended the expenditure of £11,750 and £8,250 for the erection of sub-station buildings at Stamford Hill, and the provision of plant required respectively.

Sanction has been received to a loan of £19,000 for buildings and cranes in connection with the electricity undertaking.

POPLAR.—The Electricity Committee has received sanction to loans of £23,500 for buildings, £18,500 for plant, and £7,500 for steam and feed water systems, &c.

PROPOSED CHANGE-OVER.—The Notting Hill Electric Lighting Co., Ltd., has applied to the L.C.C. for consent to an alteration in its system of supply to 400-200 V, 3-wire, d.c.

Louth.—ELECTRICITY SCHEME.—The Town Council has asked the Electricity Commissioners to supply the names of six firms of electrical engineers whose terms to prepare a report on an electricity scheme are to be ascertained.

Luton.—ELECTRICITY EXTENSIONS.—The Electricity Committee has decided to increase the boiler capacity at the power station at a cost of £14,500, and to install converters, &c., at a cost of £14,000.

Newport (Mon.).—LOAN.—The Electricity Committee is seeking sanction to a loan of £3,000 in connection with its assisted wiring scheme.

Newport Pagnell.—OPPOSITION TO SCHEME.—The Rural District Council has decided to oppose a proposal of the Northampton Electric Light & Power Co., to erect poles in Olney, for overhead cables.

Northern Ireland.—WHITEHEAD (Co. ANTRIM).—Application is being made to the Electricity Commissioners by Messrs. Curran Bros., Belfast, for sanction to the erection of a generating station for the supply of electricity to the town.

Peak District.—ELECTRICITY SUPPLY.—The position in regard to electricity supply in this district is becoming more complicated. The New Mills Council has refused to join with Chapel-en-le-Frith, Whaley Bridge, Disley and Maccesfield Councils in applying for an Order to supply electricity in the district, and the Councils do not feel justified in moving without New Mills' co-operation. Meanwhile the Power Development Company has applied for an Order to supply all the districts named except New Mills.

Portsmouth.—LOAN.—The Electricity Committee is applying for sanction to a loan of £37,000, in connection with the supply of electricity to its added areas.

Retford.—LOAN.—The Town Council is applying for sanction to the borrowing of £40,412 in connection with its electricity scheme.

Sale.—CORRECTION.—Under the heading "Price Reductions," we stated in our last issue that the revised private house domestic rate was 20 per cent. of the rateable value, plus 1½d. per kWh during the summer quarters and ¾d. per kWh during the winter quarters. We regret the error; the correct "unit" charges are ½d. and ¾d. respectively, the idea being, of course, to increase the summer consumption.

Sheffield.—ELECTRICITY EXTENSIONS.—The Electric Supply Committee has during the past month approved extensions and works at an estimated cost of £1,145, and extensions of mains for general distribution purposes, at an estimated expenditure of £17,361.

South Africa.—JOHANNESBURG.—According to the *South African Engineer*, work on the municipal power station extension is now in hand. The new building will house a 10,000 kW set, two boilers and pumping plant, with all accessories. It is expected that the erection of the machinery will begin about June, and be in operation by September.

DURBAN.—At the forthcoming session of the Natal Provincial Council application will be made on behalf of the Town Council for increased borrowing powers to an amount of £775,000, which will include £350,000 for electricity purposes.

QUEENSTOWN.—The Town Council is to proceed with its scheme for an entirely new power station and equipment. estimated to cost £30,000. The plant will include two 250-kW sets and two 8,800-lb. boilers.

South-East Lancashire Electricity Advisory Board.—TRANSMISSION LINE: RADCLIFFE TO PADIHAM.—The Engineering Advisory Committee has considered a proposal of the Lancashire Electric Power Co., to provide a 33,000-V transmission line to interconnect its Radcliffe and Padiham stations, at an estimated cost of £86,386, and has resolved that the scheme be approved.

ASHTON-UNDER-LYNE.—The Committee has received details of the Manchester offer for bulk supply, and an estimate of the cost of plant extensions at Ashton, and has decided that the question shall be adjourned.

The minutes of the proceedings of the Engineering Advisory Committee have been approved by the Board.

South Shields.—LOANS SANCTIONED.—The Town Council has received sanction to loans of £10,000 in connection with the provision of pre-payment meters and wiring installations to be let on hire, and £8,500 for mains and sub-station equipment.

EXTENSION OF SUPPLY.—The Electricity Committee is to extend the electricity supply to the housing estate, at an estimated cost of £7,500.

Special Orders.—Application has been made to the Electricity Commissioners by the Aldershot Gas, Water & District Lighting Co., for a Special Order authorising it to extend its area of electricity supply, so as to include the urban district of Fleet, and certain parishes in the rural districts of Hartley, Wintney, Basingstoke, Guildford and Hambledon.

The Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Wrexham Rural District Council to supply electricity in the district and part of the rural district of Hawarden; the Teignmouth Electric Lighting Co., Ltd., to supply in part of the rural district of Newton Abbot; and the Electrical Distribution of Yorkshire, Ltd., within the rural district of Hemsworth.

Tramway and Railway Notes.

Continental.—FRANCE.—The Compagnie des Tramways de Cherbourg has received sanction to proceed with the electrification of the steam tramway between Querquerville and Urville-Hague.

ITALY.—On April 21st, the Minister of Communications opened the section of the railway between Spezia and Sestri Levante (24 miles in length), which was recently electrified. The whole of the line between Modena and Spezia, a distance of 225 miles, has now been electrified, and it is intended eventually to continue the line as far as Leghorn. Italy will then possess the longest stretch of electrified railway track in the world.—*Reuter* (Spezia).

AUSTRIA.—The *Elektrotechnik und Maschinenbau* gives some particulars of the progress of the electrification of the railway system in Austria. The first programme included the electrification of the Salzkammergut line, which was completed in the summer of 1924, and the Alberg line between Innsbruck and Bludenz, opened in May last year. Work on the second programme was immediately commenced, this comprising the electrification of the Arlberg line west of Bludenz. Altogether 45 miles of the Vorarlberg lines are in course of electrification, while similar work has also been commenced on the lines east and south of Innsbruck, the necessary capital outlay having been voted by the Austrian Parliament. The second programme also includes the electrification of the Salzburg-Worgl and Kufstein-Worgl-Innsbruck-Brenner lines, a total of approximately 190 miles. The section between Kufstein and Innsbruck is expected to be completed by the end of the present year, those between Innsbruck and Brenner and between Worgl and Saalfelden by the end of 1927, and that between Saalfelden and Salzburg by the end of 1928. The power for the railways in this second programme will be supplied from the Lake Achen, the Mallnitz, and the Stubach hydro-electric power stations. Contracts have already been placed for the electrification of the Kufstein-Worgl-Innsbruck line, and the preliminary work is well in hand. It is estimated that 75 electric locomotives will be required in connection with the second electrification programme, orders for 42 of which have already been given.

BELGIUM.—In its report for last year, the Compagnie Générale des Tramways d'Anvers states that it is to modernise its power plant, and it has been decided to install mercury rectifiers at its transformer station in place of the rotary machines at present in use. Two new transformer stations are also to be erected—one in Antwerp and one in Hoboken.

Darlington.—RAILLESS-CAR SCHEME COMPLETED.—The conversion of the Corporation's tramway system to the railless-trolley system has been completed, the last route (Harrogate Hill service) having been inaugurated on April 11th.

Japan.—NEW ELECTRIC RAILWAYS.—Applications have been made for sanction to the construction of the following electric railways:—Between Koriyama and Yimoto-machi, Fukushima-ken; from Onomichi, Hiroshima-ken to Kouko-machi, Okayama-ken; three railways, with a total mileage of 32, in the Toyama Prefecture; and from Shimizu, Shizuoka-ken to Minobu. Yamanashi-ken, a distance of 12 miles.

Musselburgh.—PROPOSED TRAMWAY PURCHASE.—According to the *Tramway and Railway World*, the Town Council has proposed that the tramway of the Musselburgh and District Electric Light and Traction Co. in the burgh shall be taken over by the Edinburgh Corporation. The company states, however, that it is not prepared to sell the undertaking at the present time upon the same terms as laid down for 1931, and the matter has been dropped.

Southend-on-Sea.—MOTOR OMNIBUSES.—The Town Council has decided to withdraw its tramway service on the Prittlewell route, and substitute motor omnibuses, augmented by railless cars.

United States.—NEW YORK.—The *Electric Railway Journal* reports that the Board of Transportation has made a formal request to the Board of Estimate for funds amounting to $100,000,000 to be spent in the construction of new subways, including a new tube from 53rd Street to Queens.

Telegraph and Telephone Notes.

Australia.—TELEPHONE SERVICE.—The annual report of the Postmaster-General shows that the telephone service working cost, for the 12 months ended June 30th, 1925, was £3,128,913, and the total revenue was £3,661,110, leaving a gross surplus of £532,196. Interest charges, however, exceeded that amount by £258,619, which represented a loss on the year's working. Capital expenditure, says the *Australian Electrical Times*, was approximately £4,000,000. Arbitration awards imposed an extra burden of £144,000 in wages during the year, in which 14,379 new telephone subscribers were connected in the metropolitan areas, and 20,301 in country districts.

TELEGRAPH SERVICE.—The telegraph services made a working loss of £53,886 for the 12 months, or, with interest added, a total loss of £227,174.

Bolivia.—RADIO-TELEGRAPHY.—The Government has thrown open for public use the 13 Marconi stations throughout the Republic in order to facilitate general communication. Heretofore the Government has prohibited the popular use of its system, the theory being that the Government service for administrative and military matters would be interfered with. According to *Commerce Reports*, the general tariff is 2.50 bolivars over and above the rate which is paid over the State telegraph line for radiograms in Spanish. For messages in a foreign language, code, or cipher, double tariff is charged.

France.—NEW TELEGRAPH APPARATUS.—A new apparatus has been installed on the Brest-Casablanca submarine cable, 1,600 miles long, which increases the working of the cable by 80 per cent. Double Baudot-Picard apparatus serves simultaneously two transmitting and receiving sectors at a speed of 140 revolutions per minute, which corresponds to 5,600 words. This improvement is due to the work of M. Carrat, Inspector of Telegraphs in Paris.—*Reuter* (Paris).

Greenland.—TELEGRAPH SERVICE.—Since February 1st last, telegraph communication with Greenland has been available to the public. Messages are transmitted by cable to Iceland and thence by wireless.

Irish Free State.—AUTOMATIC TELEPHONY.—By the end of the present year the Irish Free State will have an automatic telephone service, with about 1,400 lines. The first exchange will be in Ship Street, Dublin, and the main framework has just been installed. The installation of the fittings has been begun by a British firm which has secured the contract, and some half-a-dozen Irishmen are studying the mechanism of automatic telephones in England.

The Telephone Service.—EASTBOURNE'S AUTOMATIC PLANT.—The whole of the Eastbourne Corporation's old common-battery manual system has been replaced by a Relay centralised automatic installation, which links up 50 stations, and the switchboard in the Town Hall is built on the expanding bookcase principle, so that additional units can be added from time to time without disturbing the existing service. Under the old manual scheme, a Town Hall call to any of the outlying stations had to go through the operator at the Town Hall, who passed it through the Eastbourne public exchange, which in turn passed is through the operator at the wanted station, taking from 30 to 50 seconds, or more, and each call cost 1½d. An automatic call goes through direct in three seconds, and costs nothing. Moreover, departmental service is available all night as well as all day, and public exchange service is available over certain night lines included in this new equipment. At present 19 departments are linked up under the new scheme. Other municipalities which have adopted the Relay scheme include Battersea, Birkenhead, Birmingham Estates, Burnley, Cardiff, Hampstead, Lambeth, Leyton, the Manchester Tramway Department, and Weston-super-Mare.

TAXI-CAB TELEPHONES.—Taxi-cab telephones that can only be used for incoming calls (from the hirer to the cab rank) are being installed in various parts of Liverpool, by arrangement between the Post Office and the Liverpool Motor Cab Trade Protection Society. Manchester and Bradford have made similar arrangements for the installation of such telephones, which have been tried successfully in London. In the box containing the telephone no means of calling the exchange is provided, and the door is automatically controlled, so that an ordinary call cannot be made from that end. When a hirer calls up the cab rank, a gong sounds inside the box, and the door opens to permit the driver to reply. The Society, which rents the telephones from the Post Office, intends to have a telephone installed on every rank in the city.

Radio Notes.

Australia.—NEW TRANSMITTER.—Transmission tests from the new station at Brisbane, Queensland, have been heard 1,400 miles away at Samarai, New Guinea. The station was using 5,000 watts.

LICENCES.—Following the reduction in the number of licences in Western Australia, it would appear from figures supplied by the Postal Department that the popularity of wireless is also steadily declining in New South Wales, whereas in Victoria it shows a tendency to increase. During the month ended February 28th, 1,694 new licences were

issued in New South Wales, as compared with 7,545 in Victoria. There were then 31,625 licences in New South Wales and 44,033 in Victoria, the total for the Commonwealth being 94,227. During the month 4,273 licences were cancelled in the Commonwealth; the number now in force per cent. of the population is 1.4 in New South Wales, 2.7 in Victoria, and 1.6 for the whole of Australia.—*Reuter's Trade Service* (Melbourne).

India.—Broadcasting in Karachi.—The Karachi Radio Club has secured a transmitting set which has been loaned to it by the International Trading Co., agent of the Marconi Co. in Bombay. The municipality having granted permission, the transmitting set has been erected in Frere Hall, whence broadcasting will take place. Experiments made so far have given good results, and when sufficient progress has been achieved, it is proposed to arrange a regular broadcast programme.

Poland.—New Station Opened.—A new Polish broadcasting station was opened at Warsaw on April 18th, the speakers including Count Skrzynski, the Prime Minister, M. Grabski, Minister for Education, and M. Chamieo, president of the Polish Broadcasting Society.—*Reuter* (Warsaw).

Radio Slander.—First English Case.—In the King's Bench Division, before Mr. Justice McCardie, a settlement was announced last week of the action, the first of its kind, brought against the British Broadcasting Co., Ltd., by Messrs. Williams & Norgate, Ltd., publishers. The B.B.C. expressed an apology and regret that the inaccurate statement in question should have been broadcast and would pay the firm an agreed sum in respect of damages and costs.

Spain.—Proposed New Station.—The organising committee of the Radio Club of Alicante recently met at the Círculo Mercantil and discussed the constitution of a club and the opening of a broadcasting station. Another meeting will be held shortly to nominate the board of the club. The organising committee is of the opinion that a monthly subscription of two pesetas will cover the cost of the broadcasting.—*Reuter's Trade Service* (Madrid).

United States.—"Air Piracy" Claim.—It is reported that the Government has lost the "air piracy" case against the Zenith radio station, charged with broadcasting at illegal hours and on illegal wave lengths. The decision denies that Secretary Hoover has the power to regulate the air, and may result in chaos unless legislation by Congress is enacted.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—Melbourne.—June 16th. City Council. Turbo-alternator, exciter, and condensing plant.*

Brisbane.—August 26th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator.*

Adwick-le-Street.—May 19th. Urban District Council. H.p. switchgear and cables, step-down transformers, l.p. distribution gear, pillars, cables, joint boxes, &c. (April 16th.)

Belgium.—Antwerp.—May 28th. Municipal Council. Three electric cranes at the Entrepôt Royal. Particulars (Cahier des Charges) for 3½ fr. from Hotel de Ville.

Bristol.—May 13th. Electricity Department. One 7,000-kW turbo-alternator, with condensing plant and auxiliaries. (See this issue.)

Cheadle and Gatley.—May 3rd. Electricity Department. Electric lamps for street lighting for the year ending March 31st, 1927. Form of tender, &c., from Mr. R. W. Willis, engineer and manager, 37, High Street, Cheadle, Cheshire.

Doncaster.—May 4th. Electricity Department. One 1,000-kW motor converter and l.p. switchgear. (April 23rd.)

Dublin.—May 4th. Electricity and Public Lighting Department. E.h.p. and l.p. cables, cast-iron pillars, and stoneware troughing, section pillars, compound and other materials and accessories for one or two years. (April 23rd.)

Farnworth. — May 14th. Electricity Department. Cables, street-lighting pillars, pillars and boxes, cut-outs and meter boards, and meters. (See this issue.)

Glasgow.—May 6th. Electricity Department. L.p. cables, small i.r. insulated cables and flexibles, meters and carbons for 12 months. (April 23rd.)

Hull.—May 20th. Electricity Department. Underground cables. (See this issue.)

Ilford.—May 11th. Electricity Department. One 1,000-kW La Cour motor converter. (See this issue.)

India.—India Store Department. May 7th. 15 motor-coach underframes and bodies, 30 motor bogie trucks. (March 12th.)

May 11th. One 200-kW La Cour-type motor converter. (April 23rd.)

May 14th. Three 5-kW oil engine-driven generator sets, one switchboard, and two pumping sets.*

May 15th. Madras and Southern Mahratta Railway Co., Ltd. Telephone line material (comprising porcelain insulators, galvanised terminal irons, &c.), copper line wire (1,302 miles), copper binders, tapes, &c. (April 23rd.)

May 18th. Porcelain insulator cups. (See this issue.)

London.—London County Council.—May 4th. Electric wiring and fittings at the Alton Street elementary school, Poplar, E. (April 16th.)

H.M. Office of Works.—May 7th. Steel conduits and fittings for electric wiring. (April 23rd.)

St. Marylebone.—May 5th. Electricity Department. L.p. and e.h.p. underground cables for 12 months. (April 23rd.)

Metropolitan Asylums Board.—May 19th. Installation of electric cable, &c., for arc-light treatment apparatus. (See this issue.)

Manchester.—May 11th. Tramways Committee. Electric tramcar bodies, trucks, motors, and controllers. Specifications from Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly, Manchester.

Middlesbrough.—Electricity Department. Extension of electricity supply distributors, total length approx. 1,000 yd. (See this issue.)

New Zealand.—Auckland.—June 21st. Electric Power Board. L.p. insulators, &c.*

Wellington.—May 12th. Post and Telegraph Department. 18 switchboards.*

Public Works Department. July 20th. Phase transformer for Mangahao electric power scheme.*

New Zealand Railway Department. June 16th. Electric motors.*

Dunedin.—May 28th. Otago Harbour Board. One portable electrically-driven cargo stacker.*

Nottingham.—May 31st. Board of Guardians. One 60-kW d.c. turbo-generator, &c., and alterations to main switchboard, &c. (April 16th.)

Preston.—The Tramways Committee has decided to obtain quotations for the supply of a new double-deck tramcar and the adaptation of an existing one for use on the Ashton route.

Seaham Harbour.—May 5th. Urban District Council. Overhead l.p. pole line, h.p. cables, sub-station equipment, h.p. switchgear. Specifications (£2 2s.) from Mr. J. E. Favell, consulting engineer, 22, Oxford Street, Newcastle-on-Tyne.

South Africa.—Johannesburg.—Municipal Council. 8 miles h.p. cable, 41 miles l.p. cable.*

Southern Rhodesia.—June 21st. Department of Posts and Telegraphs. Automatic telegraphs. Automatic telephone exchange for Salisbury. (April 23rd.)

Stockton-on-Tees.—May 10th. Electricity Department. Paper-insulated cables, a.c. meters, and house-service cut-outs. (See this issue.)

Turkey.—May 15th. Direction Générale des Postes et Télégraphes. 111,000 metres of 3, 7, 10 and 12 pair aerial telephone cable; 10,000 metres of 3, 7, 10 and 12 pair underground cable, with joint boxes and accessories.*

Walthamstow.—May 12th. Electricity Department. One 1,500-kW motor converter. (April 23rd.)

Warrington.—May 10th. Electricity Department. E.h.p. sub-station truck-type switchgear. (April 23rd.)

Waterford.—May 12th. Electricity Department. Two 250-kVA, 3-phase alternators direct coupled to heavy oil engines, e.h.p. mains and l.p. underground distribution system, transformer kiosks, pillars, street lighting services, l.p. overhead distribution system, &c. (April 9th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—Melbourne:—Postmaster-General's Department. Accepted:—

Night switching and dialling keys, ring-back keys, and speak-and-ring keys (£1,971).—Telephone Mfg. Co., Ltd.
Plug-seat switches (£782).—British L. M. Ericsson Mfg. Co., Ltd.
5 miles of cable, 12 pair (£1,187).—Hackbridge Cable Co., Ltd.

Brisbane.—Postmaster-General's Department.

Four loading coil cases, containing 80 coils each (£1,104).—Standard Telephones & Cables (Aust.) Ltd.

Sydney.—New South Wales Railways.

21,000 yd. 66,000-V, single-core lead-covered cable (£10,944).—Enfield Cable Works (Aust.), Ltd.

—*Tenders.*

Barnes.—Urban Council. Accepted:—

Supplying and laying cables (£8,463).—Siemens Bros. & Co., Ltd.

Belfast.—Electricity Department. Accepted:—

Time switches for 12 months.—Venner Time Switches, Ltd.

Bexhill.—Electricity Committee. Recommended:—

500 yd. 3-core cable (£143).—Enfield Cable Works, Ltd.
Cable for switchboard extension (£121).—British Insulated Cables, Ltd.

Government Contracts.—The following Government contracts were placed during March, 1926:—

ADMIRALTY CONTRACT AND PURCHASE DEPARTMENT.

Rewinding motor alternators.—Small Electric Motors, Ltd.
Aluminium sheets, &c.—British Aluminium Co., Ltd.
W./t. ammeters.—H. W. Sullivan, Ltd.
W./t. boards.—W. McGeoch & Co., Ltd.; Whipp & Bourne, Ltd.
Circuit boxes.—Basebe, Sadler & Co., Ltd.; Engineering & Lighting Equipment Co., Ltd.; Foster Engineering Co., Ltd.; General Electric Co., Ltd.; Hawkers, Ltd.; Player & Mitchell; Whipp & Bourne, Ltd.
Electric cable.—Anchor Cable Co., Ltd.; Enfield Cable Works, Ltd.; General Electric Co., Ltd.; W. T. Glover & Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Hooper's Telegraph & India Rubber Works, Ltd.; Johnson & Phillips, Ltd.; Siemens Bros. and Co., Ltd.
Cells.—Fuller's United Electric Works, Ltd.
Coils, w./t.—H. W. Sullivan, Ltd.
W./t. condensers.—Dubilier Condenser Co., Ltd.; Sparklets, Ltd.
Electric travelling crane.—J. Booth & Bros., Ltd.
Electric heating elements.—Credenda Conduits Co., Ltd.
W./t. frameworks.—Westminster Engineering Co., Ltd.
W./t. heterodyne units.—H. W. Sullivan, Ltd.
W./t. inductances.—H. W. Sullivan, Ltd.
Electric lamps.—Siemens & English Electric Lamp Co., Ltd.
W./t. masts.—C. F. Elwell.
Mica.—Mica & Micanite Supplies Co., Ltd.; Dacier, Ltd.; Micanite and Insulators Co., Ltd.; Mica Mfg. Co., Ltd.
W./t. motor alternators and motor generators.—Newton Bros. (Derby), Ltd.
Electric motors.—Brush Electrical Engineering Co., Ltd.
W./t. panels.—H. W. Sullivan, Ltd.
Automatic starters (w./t.).—Watford Electric Mfg. Co., Ltd.
Switchboard and switchgear.—Edison Swan Electric Co., Ltd.
Changeover switches.—General Electric Co., Ltd.
Tin wire.—C. Clifford & Son, Ltd.; British Insulated Cables, Ltd.
Valves.—Mullard Radio Valve Co., Ltd.
Valves and lamps.—Edison Swan Electric Co., Ltd.; General Electric Co., Ltd.

Hand lamps.—Cable Accessories Co., Ltd.
Lamps.—Edison Swan Electric Co., Ltd.
Insulating tape.—Connollys (Blackley), Ltd.
Replacing batteries (Manchester (Central) telephone exchange).—D. P. Battery Co., Ltd.
Manufacture, supply, drawing-in and jointing cable.—London-Dorking: Siemens Bros. & Co., Ltd. London-Welwyn: W. T. Henley's Telegraph Works Co., Ltd.
Electric lighting (Brighton new sorting office and telephone exchange).—A. Hawkins & Sons.
Radio station power plant (St. Albans).—British Thomson-Houston Co., Ltd.
Telephone exchange equipment.—Macclesfield: Standard Telephones and Cables, Ltd.; sub-contractors: Electric Construction Co., Ltd., for charging machines; Crompton & Co., Ltd., for ringing machines. North, Leith, Birmingham (East): Standard Telephones & Cables, Ltd. Kelvin, Cheltenham, Ipswich, Torquay: Automatic Telephone Mfg. Co., Ltd. Southend (2nd relief): Siemens Bros. & Co., Ltd.; sub-contractors: English Electric Co., Ltd., for charging machines; Crompton & Co., Ltd., for ringing machines; Chloride Electrical Storage Co., Ltd., for batteries. Beauchief, Hereford: Siemens Bros. and Co., Ltd. Foleshill (Coventry): General Electric Co., Ltd.; sub-contractors: Crompton & Co., Ltd., for charging machines; Automatic Telephone Mfg. Co., Ltd., for ringing machines; Chloride Electrical Storage Co., Ltd., for batteries. Harrogate: General Electric Co., Ltd.; sub-contractors: Crompton & Co., Ltd., for machines; D. P. Battery Co., Ltd., for batteries. Clerkenwell: General Electric Co., Ltd.
Private branch exchange telephone equipment.—Motherwell County Hospital; Gaumont & Co., Ltd. (W.); Armitage & Rigby, Ltd. (Manchester); Ye Mecca, Ltd. (S.E.); Burnley Corporation; Shell-Mex, Ltd. (S.W.); A. Dunkelsbuhler & Co. (E.C.); Swan & Edgar, Ltd. (W.); Maypole Dairy Co., Ltd. (E.C.); Camberwell Board of Guardians (S.E.); T. Forman & Sons (Nottingham).—Relay Automatic Telephone Co., Ltd.

H.M. OFFICE OF WORKS.

Imperial Institute, S.W., wiring.—F. Troy & Co., Ltd.
Cable.—Lydbrook Cables, Ltd.

CROWN AGENTS FOR THE COLONIES.

Cables.—British Insulated Cables, Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Standard Telephones & Cables, Ltd.; St. Helens Cable and Rubber Co., Ltd.
Copper wire, &c.—Shropshire Iron Co., Ltd.; R. Johnson, Clapham and Morris, Ltd.; Elliott's Metal Co., Ltd.
Electric portal cranes.—W. Arrol & Co., Ltd.; Wellman, Smith & Owen Engineering Corporation.
Electrical materials.—F. Smith & Co., Ltd.
Tubular poles.—Siemens Bros. & Co., Ltd.

Irish Free State.—DUBLIN.—The following contracts were placed by the Controller of Stores (Posts and Telegraphs) from February 23rd to March 22nd, 1926:—

Battery boxes, Leclanché.—G. Perry & Co., Ltd.
Broadcasting supply instruments.—Marconi Wireless Telegraph Co., Ltd.
Cable.—F. Routledge; Victor Zorn; Enfield Cable Works, Ltd.
Copper wire.—W. F. Dennis & Co.; Siemens-Schuckert (Ireland), Ltd.
Generators.—Sterling Telephone & Electric Co., Ltd.
Megger.—Evershed & Vignoles, Ltd.
Cable rings.—Standard Telephone & Cables, Ltd.
Telephone cabinets.—Siemens Bros. & Co., Ltd.; British L. M. Ericsson Mfg. Co., Ltd.
Switchboard parts.—Phœnix Telephone & Electric Works, Ltd.; Siemens Bros. & Co., Ltd.; International Electric Co., Ltd.

London.—LONDON COUNTY COUNCIL.

Tram track rails (about 4,400 tons) for the next 12 months:—

Bolckow, Vaughan & Co., Ltd. (Accepted.)	**£46,607**
Cargo Fleet Iron Co., Ltd.	48,819
Alexr. McBean & Son (for Dorman, Long & Co., Ltd.) ...	50,415

20-V, 20-amp. accumulators.—Edison Swan Electric Co., Ltd.

Education Committee. (Accepted.)

Alterations to electric lighting, Shap Street school, Shoreditch (£226).—G. Keetch.

STEPNEY.—Electricity Supply Committee. Accepted:—

4 tons plumber's solder (£408).—G. W. Neale, Ltd.
12 feeder boxes and 12 sub-feeder boxes (£399).—British Insulated Cables, Ltd.
24 single feeder boxes (£150).—W. Lucy & Co., Ltd.
4 tons sheet lead (£175 10s.).—G. Farmiloe & Sons, Ltd.
100 tons pitch (£494).—Gas Light & Coke Co.

GREAT WESTERN RAILWAY.

Two 30 cwt. electric luggage lifts at Queen Street station, Cardiff, and an 8-cwt. electric lift at the west end of the general offices at Paddington.—Smith, Major & Stevens, Ltd.

Morley (Yorkshire).—

Electrical wiring, &c., municipal houses on Middleton Road estate (£341).—F. W. Rhodes.

Northampton.—Rural Council. Accepted:—

Wiring Council houses at Bugbrooke and Nether Heyford (£5 17s. 9d. per house).—Northampton Electric Light & Power Co., Ltd.

Peterborough.—Town Council. Accepted:—

Boiler plant (£34,190).—International Combustion, Ltd.
Pulverised fuel plant (£24,936).—Simon-Carves, Ltd.
—*Peterborough Standard.*

Preston.—Electricity Committee. Recommended:—

Cables (£6,633).—British Insulated Cables, Ltd.
Transformers.—English Electric Co., Ltd. (£1,226); Ferranti, Ltd. (£1,000).

Preston-Blackpool transmission line:—

45,000-V underground cable (£15,572).—W. T. Glover & Co., Ltd.
Transformers (£21,138).—English Electric Co., Ltd.
Switchgear (£3,907).—Metropolitan-Vickers Electrical Co., Ltd.
Overhead line in Longton area (£3,711).—Callender's Cable & Construction Co., Ltd.

Retford.—Town Council. Accepted:—

Generating plant (£12,020).—Electric Construction Co., Ltd.

Southend-on-Sea.—Town Council. Accepted:—

Replating the traction battery (£3,050, less allowance for old plates, £738).—Chloride Electrical Storage Co., Ltd.

Swansea.—Electricity Committee. Accepted:—

Oil purifier (£175).—Haslam & Stretton, Ltd.

Todmorden.—

Electric lighting installation at Todmorden Hall, Post Office.—B. Beattie.

Torquay.—Electricity Committee. Accepted:—

1,000-kVA, 3/2-phase transformer group (£832).—British Electric Transformer Co., Ltd.
Switchgear (£574).—British Thomson-Houston Co., Ltd.

Tynemouth.—Electricity Committee. Accepted:—

Cable.—Standard Telephones & Cables, Ltd. (£604); Macintosh Cable Co., Ltd. (£142 and £1,635).

Forthcoming Events.

Royal Institution.—Friday, April 30th. At 21, Albemarle Street, W.1. At 9 p.m. Lecture on "Wireless in the Empire," by Dr. W. H. Eccles.
Thursday, May 6th. At 5.15 p.m. Lecture on "The Imperfect Crystallisation of Common Things," by Sir William Bragg. (Lecture II.)

Junior Institution of Engineers.—Friday, April 30th. At the Royal United Service Institution, Whitehall. At 7.30 p.m. Gustave Canet Memorial Lecture, "Air Transport," by Air Vice-Marshal Sir W. Sefton Brancker.
Friday, May 7th. At 39, Victoria Street, S.W. At 7.30 p.m. Lecturette, "Distortion in Wireless Reception," by Mr. A. V. Ballhatchet.

Institution of Engineers-in-Charge (Inc.).—Friday, April 30th. At the Holborn Restaurant, London. At 6 p.m. Annual dinner.

Institution of Electrical Engineers (Western Centre).—Monday, May 3rd. At the Chamber of Commerce, Swansea. At 6 p.m. Paper on "An All-Electric House," by Dr. S. P. Smith.

(Wireless Section).—Wednesday, May 5th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Paper on "The Lateral Deviation of Wireless Waves and the Development of an Accurate Direction-Finder," by Messrs. R. L. Smith and R. H. Barfield.

(Scottish Centre).—Friday, April 30th. At the Y.M.C.A. Hall, Constitution Road, Dundee. At 7.30 p.m. Lecture on "The Past, Present, and Future Development of Wireless Telephony," by Capt. P. P. Eckersley. Saturday, May 1st. Excursion to St. Andrews.

Society of Engineers.—Monday, May 3rd. At the Science Museum, South Kensington, S.W. At 5.30 p.m. Paper on "Landmarks in the History of Prime Movers," by Mr. H. W. Dickinson.

National Association of Supervising Electricians.—Tuesday, May 4th. At the Junior Institution of Engineers, 39, Victoria Street, S.W. At 7.15 p.m. W. E. Highfield Shield Competition.

Roentgen Society.—Tuesday, May 4th. At 32, Welbeck Street, W. At 8.15 p.m. Ordinary meeting.

Edinburgh Electrical Society.—Wednesday, May 5th. At the Royal Scottish Society of Arts, 117, George Street. At 8 p.m. Business meeting.

Royal Society of Arts.—Wednesday, May 5th. At John Street, Adelphi, W.C. At 8 p.m. Lecture on "Radio: Its Past, Present, and Future," by Mr. C. F. Elwell.

Electrical Association for Women.—Friday, May 7th. At the Criterion Restaurant, Piccadilly, W. At 1 p.m. Luncheon.

(Manchester District Branch).—Wednesday, May 5th. At the Lesser Free Trade Hall, Manchester. At 7.30 p.m. Public meeting.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, May 8th. At Brecon. Annual meeting.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

COLERIDGE electric irons.

Notes.

The Burgh of Hamilton Vacancy.—In our last issue in our "Personal" column we reported, on the authority of our Glasgow correspondent, that "Mr. W. J. Cooper, acting electrical engineer at Hamilton Electricity Works, has been appointed electrical engineer for the Burgh of Hamilton." In our advertisement pages of the same issue we published the Town Council's invitation for applications for the appointment. We subsequently received a communication from the Town Clerk of Hamilton informing us that the "Personal" column statement was incorrect, and had caused inconvenience to applicants. Further investigation shows the facts of the situation to be as follows:—The Town Council Electric Lighting Committee unanimously agreed to recommend that Mr. W. J. Cooper, at present acting electrical engineer, be appointed electrical engineer for the burgh. When the recommendation came before the Town Council, there was an amendment that the Council advertise for an engineer. The voting was six for the recommendation and six for the amendment. The Provost gave his casting vote for the amendment, and it was therefore agreed to advertise.

In the absence of the exact details, our correspondent accepted as authentic a report published in Glasgow. We have to express our regret to those concerned for any inconvenience to which they have been put in connection with the matter.

The Electricity (Supply) Bill.—This Bill came before a Standing Committee of the House of Commons on Tuesday last. Criticism was directed against the proposed Central Board, which, Sir Joseph Hall suggested, would in effect be merged in the Electricity Commission. Sir Charles Wilson considered that there was no need for such a board, as the Electricity Commissioners were quite competent to accomplish the aims of the Bill. Mr. Wallhead protested against the subjugation of efficient municipal undertakings to the Board.

A report of the proceedings will appear in our next issue.

Stage Lighting.—A discussion on this subject took place at the meeting of the Illuminating Engineering Society on March 30th, which was held at the E.L.M.A. Lighting Service Bureau. Mr. J. W. T. Walsh presided. Mr. H. Lester Groom, who opened the discussion by presenting a paper, illustrated by slides and exhibits of apparatus, pointed out that lighting on the stage was now called upon to discharge functions not associated with it in the past. It did not merely serve to permit the spectator to follow the play, but also enabled certain mental effects to be created, so that it reinforced and supplemented the action. In this connection he quoted from Kenneth McGowan's book on "Continental Stage Craft." The aim of stage lighting is to provide light of any intensity, hue and tint, just when and where it may be required. For this purpose a great variety of lighting implements is needed.

Mr. Groom then proceeded to describe and illustrate the action of footlights, battens or border lights, spot lights and portable units, and the cyclorama. The most important development of recent years has been the effort to obtain a representation of realistic and natural atmospheric effects on the stage. For this purpose cycloramas are extensively used abroad, and consist of two types, a solid "sky dome" consisting of a plaster surface supported by a metal framework, and a movable canvas "artificial horizon" cloth running on a curved rail, which can be rolled up out of the way when not required. The use of this device involves some modfiication in the lighting of the acting area, as care has to be taken to prevent light from battens, footlights, &c., striking the canvas. Special floods called "acting area floodlights" are used and are dimmed down sufficiently to avoid interference with the lighting of the cyclorama. Details of cyclorama lighting and panorama and cloud-forming apparatus were given, and the arrangement of the battery of colour-elements was described. Taking the complete range of conditions from a small theatre to a large opera house, the power consumption for this equipment may range from 20 to 100 kW.

Mr. Groom also discussed the choice of dimmers, on which successful lighting largely depends, and emphasised the importance of the whole stage lighting being controlled from one central position. In the final section of the paper a reference to the possibilities of colour on the stage was made. The author explained how modifications in the colour of light, falling on a painted background, may entirely change the appearance of scenery; this principle has been applied to produce ingenious transformations in the garments of dancers; in the same way fluorescence of garments impregnated with special dyes, under the action of ultra-violet light, has been used.

There is now a distinct tendency for kinema theatres to combine the exhibition of films with displays of a more or less theatrical character and some of the latest theatres, especially in Germany, have been fitted with complete stage-lighting equipment. The cyclorama apparatus may form a valuable auxiliary in kinema displays, provided sufficient depth of stage is allowed to give a proper perspective. At the recently opened Plaza Theatre in London a completely equipped stage, including the cyclorama, has been provided.

In conclusion Mr. Groom remarked that the stage lighting of the future would require the co-operation of the scenic artist, the producer, and the stage-lighting expert.

The discussion was opened by Mr. L. G. Applebee, who exhibited a variety of stage-lighting units and lantern slides illustrating the application of flood lighting at the Searchlight Tattoo at Wembley. An effective demonstration was also given of projecting apparatus enabling the motion of waves of the sea, falling snow, and fire and smoke to be imitated.

Local Society.—A meeting of the Birmingham Electric Club took place on April 23rd, when Mr. C. G. McDonald opened a discussion on "Regulations for the Electric Equipment of Buildings." The summer outing of the club is arranged for May 14th to the English Electric Company's works at Preston.

Electro-Farming Conference.—Under the auspices of the British Electrical Development Association Agricultural Sub-Committee, the second British Electro-Farming Conference will take place on July 8th in the Members' Tent on the Showground of the Royal Agricultural Society at Reading, by the courtesy of the Council of the Royal Agricultural Society. Further details of the Conference will be issued later.

The L.C.C.'s Annual Estimates.—The estimates for the year 1926-27 were to be submitted to the London County Council at its meeting on Tuesday last. The agenda for the meeting contained a number of amendments to items in the estimates, including one providing for the operation of petrol and trolley omnibuses by the Council, and another to empower the Council to own and operate tube railways, and to acquire the existing underground railways.

Extensions at Wallasey.—The opening of the new extensions to the Wallasey Corporation power station was performed on April 21st by the Mayoress, Mrs. J. W. Holdsworth, in the presence of a large company of electrical engineers and local representatives, and the event was celebrated by an official luncheon after the ceremony.

The Mayor of Wallasey, Alderman J. W. Holdsworth, J.P., in proposing "The Electricity Undertaking, Engineer and Staff," said that Wallasey inaugurated her electricity supply in 1897, from which time it had proved itself an asset both from the point of view of finance and service. A matter of £120,000 had been contributed to the relief of rates. The Corporation was proud of its electricity undertaking, and claimed that it was second to none in the country. He paid a tribute to Mr. B. T. Hawkins, the borough electrical engineer, and his staff. New consumers were being connected at the rate of 1,000 per annum in spite of the zeal and energy of the Corporation Gas Committee. Their immediate neighbour, Birkenhead, was drawing large supplies of electricity from Wallasey, and in return Wallasey was taking large supplies of Birkenhead water.

Mr. E. M. Hollingsworth, M.I.M.E., M.I.E.E., said it was some years since he had visited the Wallasey undertaking, whose progress had been incredibly rapid. Wallasey was in the forefront of electricity supply. Its record as regarded thermal efficiency, low cost of production, average selling prices, and reliability of supply was outstanding. He had burned midnight oil in trying to understand the Electricity Supply Bill, particularly Clause 30, which referred to the lopping of trees, &c. In going through the Wallasey power station his sympathy with the promoters of the Bill was intensified. If there were more stations like Wallasey's the problem of the Government would be simple.

Alderman E. G. Parkinson, J.P., proposed "Neighbouring Electricity Undertakings." Electricity, he said, was rapidly becoming a marked feature in the life of this country. The electrical industry was still in its youth, and almost every day there seemed to be something fresh to learn.

Councillor G. P. Dennis, chairman of the Birkenhead Electricity Committee, urged the need for co-ordination in the matter of electricity supplies between the Merseyside boroughs. If it were possible to get the electrical engineers of Liverpool, Birkenhead, and Wallasey together, to draw up a scheme for the electrical development of the Merseyside towns it would be of advantage to the whole district.

Councillor J. Hughes complimented the contractors and Mr. A. T. Brotherton, Brush Electrical Engineering Co., Ltd., and Mr. W. Bayliss, Messrs. Babcock & Wilcox, Ltd., made suitable replies.

Councillor J. McMillan, M.B., said that the scheme which had been consummated that day had cost over £100,000. The financial policy of the Electricity Department was to build up reserve funds so that no matter what the Government decided to do, Wallasey would always have a financially sound electricity undertaking.

Councillor J. Hughes said that in 1913 each kWh generated at the Wallasey undertaking required 7½ lb. of fuel; in 1918, when the new station was opened, the fuel consumption was 3.89 lb., and to-day it was 2.7 lb. They had over 10,000 consumers. The capital expenditure in 1913 was £123,000, and in

1926 £453,748. The gross revenue had increased from £32,517 to £124,000 within the same period.

On behalf of the electrical contractors, Mr. Brotherton then presented a silver salver, suitably inscribed, to the chairman of the Electricity Committee and also to the Mayoress. The members of the Council also presented a roll-top desk and a bookcase to the chairman of the Electricity Committee, to mark the occasion of his recent marriage.

After the luncheon the visitors made a motor tour round the northern extremity of the Wirral Peninsula, returning via Birkenhead. The extensions include two 35,000-lb. Babcock & Wilcox boilers, a 5,000-kW Brush-Ljungström turbo-alternator, an electrically remote-controlled switchboard, by the Metropolitan-Vickers Electrical Co., Ltd., and coal- and ash-handling plant and auxiliaries.

Italian Railway Electrification.—In connection with the recent decision of the "Ferrovia Nord" (Italy) to electrify portions of its suburban railway system between Milan and Saranno and between Bovisa and Meda, it is understood that the Brown Boveri organisation has secured the contract for the electrical equipment "against very strong competition." At present the work to be carried out consists of:—(1) The electrical equipment for the sub-station at Novate, consisting of three 2,000-kW sets of power rectifier plant operating at a d.c. pressure of 3,000 volts, the step-down being from three-phase, 22,000 volts at 42 periods. (2) The electrical equipment of eight four-axle motor coaches, each provided with four 184-h.p. (one hour rating) motors, operating two in series across 3,000 volts. (3) The electrical equipment of eight trailer coaches, provided with drivers' cabs. A train will generally consist of a motor coach at one end, with two or three ordinary trailers according to requirements, and a trailer with a driver's cab at the other end. Control will thereby be obtained at both ends without the necessity of using two motor coaches. The normal speed of the trains will be about 33.5 m.p.h., and the maximum speed about 62 m.p.h. The latest improvements with regard to electro-pneumatic safety control will be embodied, being such that in the event of an accident to the driver the train will be automatically brought to a standstill. The safety arrangements operate in such a manner that a time interval must elapse before they come into operation; that is to say, they will only operate after a certain distance has been covered, so that if the driver leaves his position for a few moments the train will not unnecessarily be stopped. An interesting feature is the fact that high-power rectifiers are being again used for the conversion, while a further point is that the control, as well as the arrangement of the trailers, is not only suitable for suburban service, but also for underground conditions. The electro-pneumatic control referred to can be applied equally well for cases where other systems are at present in use.

Fatalities.—An inquest was held at Torquay on Herbert Burney (14), an apprentice to Mr. S. E. Hunt, electrician, 8, Torwood Street, Torquay, who received a fatal electric shock in the basement of his employer's premises. It appears that an old flexible cord which was supplying a light in the cellar from the shop above, was making contact with tubing stored in that department, and that the boy obtained the shock from contact with the tubing. The cellar was damp. Mr. H. F. G. Woods, the Torquay Borough Electrical Engineer, said it was obvious that the flex produced had been badly rubbed in two places, and that if it became entangled with the tubing the whole of the latter would become alive. It was stated by two doctors that the lad was in a somewhat abnormal condition and that it was due to that fact that a shock at 200 volts had killed him. In recording a verdict of "Accidental Death," the Coroner said he could not shut his eyes to the fact that there had been thoughtlessness, and for all he knew a jury might have taken a more serious view of it. He hoped those who read the facts in the papers would take notice of them and adopt proper precautions and see that these thoughtless things were not done. The Coroner thanked Mr. Hunt for doing what he could for the boy.

While working on the construction of a concrete bed on the City and South London Railway extension to Morden at Balham, on April 26th, Edward Cox slipped and touched the "live" cable, receiving a fatal shock.

The Illuminating Engineering Society (U.S.A.).—The twentieth annual convention of the Illuminating Engineering Society will be held at Spring Lake, N.J., from September 7th to 10th, inclusive, with headquarters at the Essex and Sussex Hotel, a short trip from New York and Philadelphia. A well-rounded papers programme is being prepared, with special features showing the developments in specific fields which have taken place during the twenty years of existence of the Society. Special and unique features are also being planned for the entertainment programme.

Educational.—The Polytechnic, Regent Street, W.—Electrical Engineering Department, Wireless, and High-frequency Section.—A special course of six lectures on "The Thermionic Valve and its uses in Wireless Circuits" will be delivered by Mr. W. H. Date, on Wednesdays, commencing May 12th, from 6.30 to 8.30 p.m. Fee for the course, 7s. 6d. Particulars, &c., from the Director of Education.

A special course of six lectures on "Electrical Engineering Economics" will be given on Thursdays, commencing May 13th, by Mr. D. J. Bolton. Fee for the course, 7s. 6d.

Borough Polytechnic Institute, Borough Road, S.E.—Short courses of lectures and laboratory work on electrical engineering, including alternating currents, automatic telephony, cable jointing, and physics, commence on May 3rd. Full particulars can be obtained from Mr. J. W. Bispham, the Principal. (See our advertisement pages to-day.)

Electrical Association for Women.—In connection with the newly-formed Manchester District Branch of the above Association, a public meeting will be held in the Lesser Free Trade Hall, Manchester, on May 5th, when the chair will be taken by Mr. B. Mouat Jones, D.S.O., Principal of the College of Technology. The meeting will be addressed by Miss Ellen Wilkinson, M.P., President of the Branch, Mr. J. A. Roberts, M.I.E.E., and Miss C. Haslett, Director of the Association. Further particulars with regard to the meeting can be obtained from the local Hon. Secretary, Miss G. L. Entwistle, A.M.I.E.E., c/o the Motor Department, Metropolitan-Vickers Electrical Co., Ltd., Trafford Park, Manchester.

Appointments Vacant.—Telegraph foreman (£400), for the Government of Gold Coast. Plumber-jointer, for the Stepney Borough Council Electricity Department. Assistant mains engineer (£208 to £260), for the Gillingham Borough Council Electric Lighting Department. Electrical engineers (several), for the Calcutta Electric Supply Corporation, Ltd. Switchgear engineer (£362), for the Hackney Corporation Electricity Department. Showroom manager (£314), for the Borough of Burnley Electricity Department. (See our advertisement pages to-day.)

Institution Notes.

Institution of Electrical Engineers.—Mersey and North Wales (Liverpool) Centre.—The annual general meeting of the above centre was held on April 19th, when the officers and Committee for the 1926-27 session were appointed. The new chairman will be Mr. P. J. Robinson; vice-chairmen, Prof. F. J. Teago, D.Sc., and Mr. S. E. Britton; hon. sec. and treasurer, Mr. Oscar C. Waygood. After the meeting, Prof. S. P. Smith read his paper on "An All Electric House," which was followed by a very interesting discussion.

South Midland Centre.—The annual general meeting of the above centre was held on April 28th, when the Report of the Committee was presented. The total membership of the centre at March 31st last was 1,018, representing an increase of 33 on the number for the previous year.

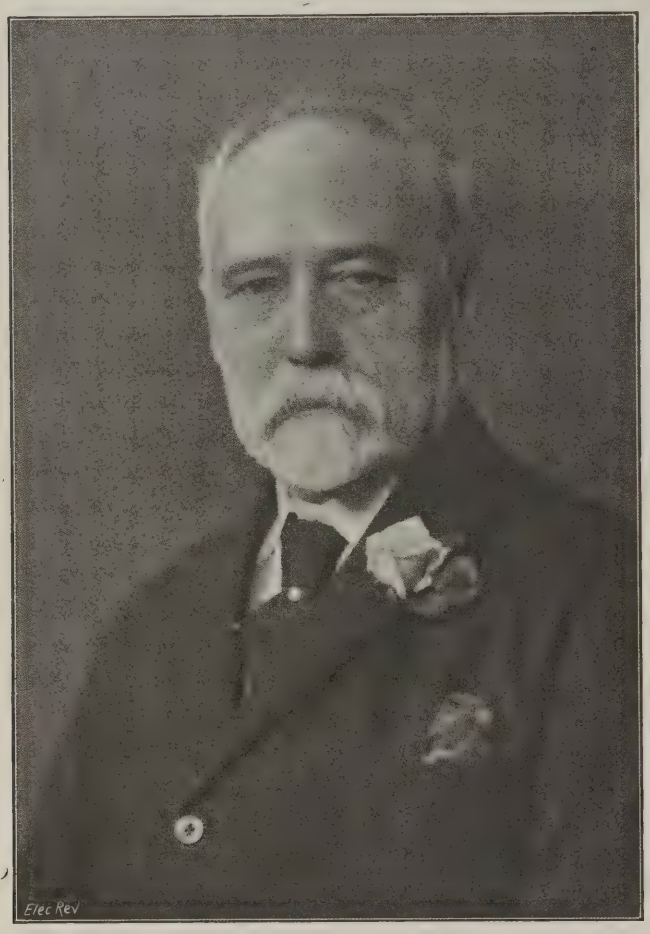
North Western and Mersey and North Wales (Liverpool) Centres.—The Committees of the above centres have arranged for a re-union to be held at Chester on May 12th. The programme includes visits to Poole Bank Farm, Tarvin, and Yew-tree Farm Sealand (both equipped with electrical appliances), the works of Brookhirst Switchgear, Ltd., and the Chester Corporation hydro-electric station.

Institute of Physics.—Physics in Industry.—The tenth lecture of this series, which is being given under the auspices of the Institute of Physics, will be delivered by Mr. H. E. Wimperis, Director of Scientific Research, Air Ministry, and will deal with "The Relationship of Physics to Aeronautical Research." The lecture, which will be open to the public, will be given in the Physics Theatre, Royal College of Science, South Kensington, on May 11th, at 5.30 p.m., and the chair will be taken by Sir William Bragg, President of the Institute.

Junior Institution of Engineers.—At the question and discussion evening on Friday last, the opportunity was taken of discussing further Mr. Allison's lecture of the previous week on the electrical equipment of automobiles. Points were raised as to the standardisation of voltage, the output of magnetos, and the manufacture and use of automobile lamps. Other topics also received attention.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).



It is reported that Mr. G. F. Moller, M.I.E.E., general manager of the Lanarkshire Tramways Company, Ltd., has resigned his position.

Mr. M. Epstein, M.A., Ph.D., was elected to succeed Mr. Oppenheimer as chairman and managing director of the Phœnix Telephone & Electric Works, Ltd. Dr. Epstein joined the board in May, 1922, and during Mr. Oppenheimer's illness has acted as deputy managing director. Mr. Edwin J. Reid, M.I.E.E., another of the directors, has been appointed technical manager. There will be no change of policy in connection with the business.

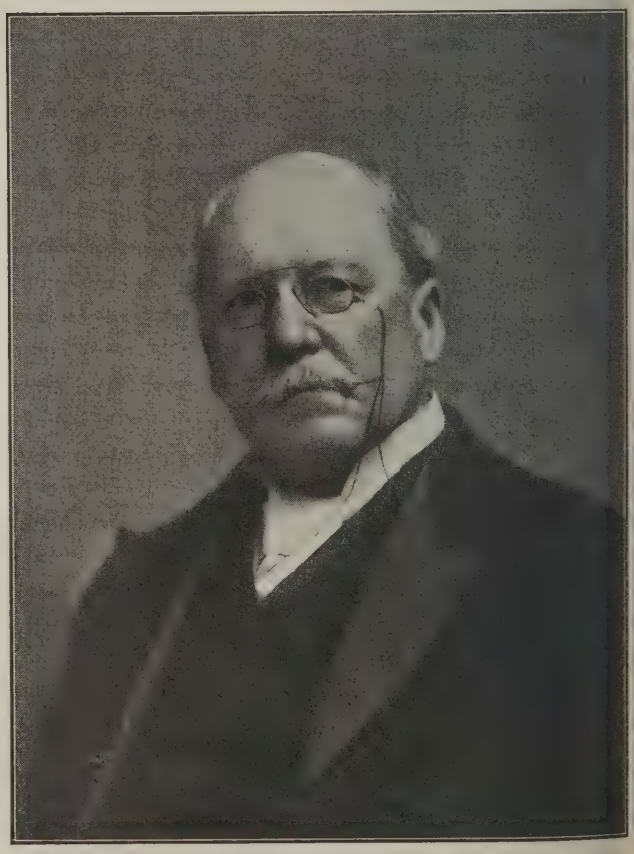
Mr. J. Roberts, who has been in charge of the power station at the Port of Richborough, has been appointed power-station superintendent to Messrs. Lake & Elliot, Braintree, who supply electricity in bulk to Braintree and Bocking.

Herr Georg Schmidt, the director of the telegraph and telephone division of the Siemens & Halske Co., Berlin, recently celebrated the completion of forty years' service with the company.

We wonder how many men there are amongst us to-day who can look back upon a record of nearly forty-two years' active connection with British electrical manufacturing in a business operating under their own name. Mr. Francis Henry Nalder, managing director and chairman of Nalder Bros. & Thompson, Ltd., who is still taking an active part in the operations of that concern, of the latest extension of whose works we gave

F. A. Swaine] [*London.*

Mr. F. H. Nalder.



an illustrated account in the Electrical Review for February 5th, 1926, dates his first productive electrical work from the end of the year 1884, when he started in business with his brother, Mr. H. Nalder. The firm thus founded opened a small works in Brentford early in 1885, and an extension soon followed. After more than forty-one years, the name Nalder still stands at the head of an extending business as our recent article indicated. Mr. Nalder was born at Reigate in May, 1859, so that notwithstanding his lengthy practical experience, he is still, as we like to regard years, comparatively young, for has not our old friend, George Offor, just passed the 99th mark? After education in England and Germany, Mr. Nalder first had four years' experience in a London merchant's office, from which he branched off to the School of Telegraphy and Electrical Engineering at Hanover Square, and subsequently to Finsbury Technical College. Then in 1884 came the Brentford development already mentioned. Two years later he was joined in partnership by Mr. C. W. S. Crawley; the works were then moved to Horseferry Road, Westminster, and extended operations were entered upon in the following year, 1887, when Mr. Alfred Soames became a partner in the firm, and the name was: Nalder Bros. & Co. Once again larger works became necessary, and the records show that in 1890 Red Lion Street, Clerkenwell, was the firm's centre of operations. The spirit of enterprise with which Mr. F. H. Nalder was possessed in those early years is evidenced by the fact that he paid four visits to the United States and Canada in the period 1891-1893, studying the course of electrical progress and development there. Other visits to the States took place in 1901 and 1904 respectively, the latter on the occasion of the International Electrotechnical Congress. When in 1896 circumstances led to the division of the business, Mr. Nalder went into partnership with the late Mr. Ernest Thompson, and established the firm of Nalder Bros. & Thompson, which devoted itself to the manufacture of every description of instrument that is employed on a switchboard, also switchgear, automatic switches, &c., and occupied works at 34, Queen Street, E.C. Still progressing, additional works had to be taken, and these, in 1899, were opened at Dalston, the business being at the same time converted into a private limited company. From this change we may take a long jump to 1914, when the Queen Street lease came to an end, and removal to the present headquarters, 97a, Dalston Lane, was undertaken, the Kingsland Green works being still retained. The larger scale operations that thus became possible helped the company to handle the demands which arose out of the requirements of the nation while at war. Before touching upon other matters, it may be remarked that the business of Nalder Bros. & Thompson, Ltd., is still Mr. Nalder's principal interest—and indeed his hobby too—for he is as alert as ever regarding new methods of manufacture, development work, and the getting of new business. It is interesting to record that his second son, Mr. D. W. Nalder, is engaged in the company's works. Personal interests have not prevented Mr. Nalder from devoting attention to the larger interests of the industry as a whole, for, as would be seen from a statement made here in another connection last week, he was one of the first members of the National Electrical Manufacturers' Association when it was born in 1905. When some six years later that organisation was put on to a larger basis and its name was changed to the British Electrical and Allied Manufacturers' Association, Mr. Nalder was appointed its first chairman, and he has been on the Council of the Association ever since, with the exception of one year during the war. He is a Governor of Battersea Polytechnic, of the Hackney Technical Institute, and of the Devas Institute; also chairman of Oertlings, Ltd., chemical balance and scientific instrument makers. He was elected as an Associate Member to the Council of the Institution of Electrical Engineers in 1890, during the presidency of the late Dr. John Hopkinson. While he is therefore one of the oldest members of the premier professional body, he also showed his appreciation of movements of a modern character on the social side of the profession a few years ago by becoming an original member of the Engineers' Club. He has been a prominent Freemason for many years.

Messrs. H. A. Lingard and Mr. W. E. Rawlinson, of the International General Electric Co., were among the passengers sailing by the Cunard liner *Aquitania* from Southampton to New York on April 24th.

Mr. Stanley H. Chatterley, late Midlands district manager for the Sterling Telephone & Electric Co., Ltd., has been appointed general manager of Cantie Switches, Ltd., Nottingham, an associated company of Brookhirst Switchgear, Ltd.

The Electric Heating Co., of George Street, Croydon, has recently appointed Mr. H. J. Dean Osgood to take over the entire control of the works. Mr. Osgood was formerly with the Dowsing Radiant Heat Co. and Messrs. H. W. Sullivan and Co.

Obituary.—Sir Henry Mance.—It is with deep regret that we have to record the death of Sir Henry C. Mance, C.I.E., LL.D. The sad event was mentioned by the president at last week's meeting of the Institution of Electrical Engineers before the delivery of the Kelvin Lecture. Members stood in silence as a mark of respect for a distinguished past-president and one of the oldest of their fellow-members. In 1873 he joined as an Associate,

Elliott & Fry] [*London.*

The late Sir Henry Mance.

becoming a full member in 1877 and president in 1897. Sir Henry passed away on Wednesday, April 21st, and the funeral took place on Saturday at Oxford. Sir Henry Christopher Mance was born at Brockley in 1840, and was therefore in his 86th year. After being privately educated, he entered the service of the Electric & International Telegraph Company at the age of 18, and in 1863 he joined the Persian Gulf Tele-

graph Expedition, which was responsible for establishing telegraphic communication between England and India. Three years later he was appointed superintendent of the Persian Gulf section of the system, and had charge of various cables and some hundreds of miles of overhead line from Karachi to the Persian Gulf. In 1879 he was appointed engineer and electrician of the line, and he held that post until he retired from the service in 1885, when he received the honour of knighthood. In his "Narrative of the Formation and Development of Telegraphic Communication Between England and India," which he entitled "Telegraph and Travel," and published in 1874, Colonel Sir Frederick John Goldsmid records the laying of the cable from Jask to Bushar, and, amongst others, favourably mentions the work of Mr. Mance, one of the superintendents. This cable was laid in 1869. Perhaps Sir Henry's most notable contribution in the form of scientific inventions was the heliograph, which was produced in 1869, and demonstrated its great value in many military campaigns. For his services in this connection he was created a Companion of the Indian Empire in 1883. But he made numerous other contributions in the shape of electrical discoveries and inventions, including a method of locating faults in ocean cables, a method of testing the internal resistance of electric batteries, &c. During his service in the East he was for a time traffic manager, was responsible for cable-repairing expeditions, and for the erection of a factory at Karachi for the manufacture of telegraph cable. He contributed a number of papers to the *Proceedings* of the Society of Telegraph Engineers on subjects connected with telegraphy and telegraphic apparatus and testing, and for one of these papers he was awarded the Paris Exhibition Premium in 1884. He was a member of the Institution of Civil Engineers and of the Physical Society. After his retirement from the telegraphic service in India he devoted his experience and attention to various electrical and other undertakings. He was the founder of the Oxford Electric Co., Ltd., and chairman of the board until his death. He was also a director, and for some time chairman, of the Electrical Construction Co., Ltd., and was on the board of the West African Telegraph Co., Ltd. He was also for many years chairman of that very successful manufacturing enterprise—Messrs. Davis & Timmins, Ltd., to whom we are indebted for the loan of the very striking and life-like photograph from which the accompanying picture has been reproduced. Of Sir Henry's three sons, one—the eldest—Brigadier-General Harry Osborne Mance, C.B., C.M.G., D.S.O., was Director of Railways, Light Railways and Roads at the War Office from 1916 to 1920.

At the funeral at Oxford on Saturday, the Institution of Electrical Engineers was represented by Mr. R. A. Chattock (president), Mr. R. W. Paul (member of Council), and Mr. R. H. Tree (chief clerk).

Mr. H. H. Markham.—We regret to record that Mr. Herbert H. Markham passed away on April 17th at the age of 48 years. Mr. Markham joined the Western Electric Co., Ltd. (now Standard Telephones & Cables, Ltd.), in 1911, and was appointed manager of its Manchester branch, subsequently occupying similar positions at Birmingham and London. In 1921 he made an extended tour through Africa for the company, and in 1925 was appointed sales manager of the Calcutta office. Unfortunately, he was struck down with malaria, which necessitated his return to England in February of this year. Previous to his connection with the Western Electric Co., Mr. Markham was in the service of Messrs. Johnson & Phillips, Ltd., and the Sturtevant Engineering Co. He was a Freemason, being a member of the Kelvin Lodge and Kelvin Mark Lodge. He passed away in his sleep, the cause of death being heart failure due to enlarged heart weakened by malaria and rheumatic fever.

Lord Stuart Wortley.—Lord Stuart Wortley, whose death at the age of 74 occurred on Saturday last, had long been connected with the London tube railway service. He was a director of the City & South London Railway Co., and of the London & Suburban Traction Co., also deputy chairman of the Underground Electric Railways Co., of London.

Mr. S. Green.—The death occurred recently of Mr. S. Green, a director of the Clowne Electric Light Company.

Will.—The late Mr. William Taylor Green, of the Leeds Corporation Electricity Department, left £3,970.

New Companies Registered.

J. P. Castle & Co., Ltd. (213,307).—Private company. Registered April 20th. Capital, £2,000 in £1 shares. Objects: To adopt an agreement with J. P. Castle, and to carry on the business of electrical and mechanical engineers as carried on by him at 40, Chancery Lane, W.C. The first directors are:—J. P. Castle, Sepham Farm House, Shoreham, Kent, engineer; Mrs. K. S. Castle, Sepham Farm House, Shoreham, Kent; J. L. Girling, Whitehouse, Felixstowe, engineer. Qualification, £10. Remuneration: 10 guineas each per annum (chairman, 15 guineas). Solicitors: Johnson and Johnson, Cromwell House, Fulwood Place, W.C.1. Registered office: 72, Shoe Lane, E.C.4.

Handcross Electricity Co., Ltd. (213,247).—Private company. Registered April 17th. Capital, £10,000 in £1 shares. Objects:—To carry on the business indicated by the title. The first directors are:—J. R. Warren, Handcross Park, Handcross; A. F. Page, M.R.C.S. (Eng.), L.R.C.P. (Lond.), The Red House, Handcross; E. S. Hibbs, Casterbridge, Handcross; D. Tulley, The Post Office, Handcross; G. Broadbridge, High Street, Handcross. Qualification, 50 shares. Remuneration as fixed by the company. Secretary: W. H. Hogger. Solicitor: R. S. Ross, Horley, Surrey. Registered office: The Post Office, High Street, Handcross, Sussex.

Official Returns of Electrical Companies.

Sylvex, Ltd.—Debenture dated April 12th, 1926, to secure £600, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: W. Wolsey, 29, Gloucester Road, N.4.

Radio Communication Co., Ltd.—Satisfaction in full on April 14th, 1926, of debentures, authorised February 23rd, 1923, securing in the aggregate £100,000.

H. E. Davis, Ltd.—W. A. J. Osborne, of Balfour House, Finsbury Pavement, E.C., was appointed receiver and manager on April 12th, 1926, under powers contained in debenture dated December 2nd, 1924.

Builth Wells Electric Supply Co., Ltd.—Particulars filed of £2,500 debentures, authorised September 4th, 1925, charged on the company's property, present and future, including uncalled capital, the amount of the present issue being £1,875 (on April 1st, 1926).

Dunstable Central Motor and Electrical Co., Ltd.—Debenture dated March 25th, 1926, to secure £300 and such further sums not exceeding £100 as the lender may between the said date and March 30th, 1930, be called upon to pay to Lloyd's Bank, Ltd., under a guarantee, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: J. E. McCabe, 8/9, Byward Street, E.C.

T. W. Jefferson, Ltd.—H. W. Bowler, of 30, North John Street, Liverpool, C.A., was appointed receiver and manager on April 12th, 1926, under powers contained in debentures created June 30th, 1922.

Reading Electric Supply Co., Ltd.—Particulars filed of £150,000 6 per cent. first mortgage debenture stock, redeemable at a premium, authorised January 7th, and covered by trust deed dated March 4th, 1926, the whole amount being now issued. The company has power to issue further stock not exceeding the amount of the share capital of the company for the time being paid or credited as paid up. Property charged: Land, premises, plant, &c., at Reading and the company's undertaking and property, present and future, including uncalled capital. Trustees: British Trusts Association, Ltd., 32, Bishopsgate, E.C.

Satisfaction in full on March 30th, 1926, of trust deed dated December 31st, 1921, securing £100,000.

British Insulated Cables, Ltd.—Satisfaction (a) to the extent of £200,000 (being amount issued) on various dates on and before February 5th, 1926, of mortgage or charge dated November 29th, 1910, securing £500,000 5 per cent. mortgage debenture stock, and (b) in full on various dates on and before April 8th, 1926, of mortgage or charge securing an issue of 4½ per cent. debenture stock dated July 22nd, 1901, as modified by indentures dated May 21st, 1902, September 27th, 1905, and November 28th, 1910, securing £500,000.

Coatbridge and Airdrie Electric Supply Co., Ltd.—Satisfaction in full on December 30th, 1925, of charges, &c., dated November 28th, 1907, to December 15th, 1921, securing £89,494 7s, 7d.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

English Electric Co., Ltd.

The annual meeting of the company was held on April 21st, under the chairmanship of Sir Charles E. Ellis, G.B.E. In moving the adoption of the report (*vide* Elec. Rev., April 16th, p. 630), the chairman said that for the first time they had prepared a consolidated balance sheet, embracing the accounts of all their subsidiary companies, and incorporating those of Willans & Robinson, Ltd., of which company they owned the entire share capital. It was their present intention that that company should remain a separate entity. The item in the balance sheet, "Sundry creditors and credit balances (including secured bank loans)," amounted to £1,296,007. As against this "Debtors and debit balances" amounted to £1,752,956, and the "Stocks and work-in-progress" to £1,353,278, or a total of £3,106,234, leaving the substantial surplus of over £1,800,000. Referring to the item "Investments, £424,585," the chairman said that in the amalgamation of the accounts they had found it necessary to provide from certain reserves for a depreciation of nearly £80,000 from the investment account. In common with other large post-war amalgamations, they had found that among the various classes of business which their constituent companies had developed there were some which were only very indirectly related to the main business of the English Electric Company, formed as it was to specialise almost entirely on electrical and mechanical engineering products. They had therefore decided to dispose of those extraneous businesses, but unfortunately two of those concerns had produced such unsatisfactory trading results as to cause a capital loss which was responsible for the major portion of the depreciation referred to. The profit and loss account was disappointing. In the first place the orders secured were lower in value than in the previous year, due almost entirely to a sudden falling off in export orders. Certain foreign governments which were in the market for the company's products demanded long credits notwithstanding their unsettled economic position and their unconventional economic principles. The board could have obtained sufficient business of that kind to have increased the turnover substantially, but it was decided that the risks were too great, and attention was directed elsewhere. In the latter part of the year the Power & Traction Finance Co. obtained a contract in Greece to the value of over two millions sterling. So far as the contractors were concerned, the transaction was on a cash basis, and of the total contract a large part represented plant and material to be manufactured in the company's works. The negotiations for that important contract were prolonged and none of the orders came into the books during the year under review and only a portion of the work would fall into the current year. There had recently been an improve-

ment in orders secured and at the present time they had unexecuted orders exceeding in the aggregate the whole output of 1925. While there were not to their knowledge any orders in hand which were unprofitable, if the negotiations proceeding between the Engineering Employers' Federation and the unions should result in a stoppage of work or a considerable advance in wages, the company's results would be materially affected. In comparing their results with those of some competitors it had to be remembered that their business was largely confined to the heavy side of electrical engineering. The company did not manufacture cables and apart from a small interest in the Siemens & English Electric Lamp Co., Ltd., it derived no revenue from lamps, radio apparatus, or electrical supplies. On the technical side progress had continued and the company stood higher to-day in technical achievement than at any previous time. The Great Indian Peninsula Railway, the first railway in India to be electrified, was running satisfactorily, as was the newly-electrified section of the Southern Railway. Their water-wheel installations in Brazil and India were operating efficiently and reliably. In steam turbines their new double-cylinder machine had produced an efficiency which it was impossible to reach with the ordinary single-cylinder machine, and they had several more sets on order similar to the initial 20,000-kW installation. The unsettled situation of the coal industries affected their very considerable colliery trade. At the present moment few collieries were prepared to proceed with their normal programmes of electrification. The present uncertainty regarding electricity supply was not only affecting supply undertakings themselves but large industrial electrification schemes were being held up for lack of definite information whether it would be cheaper to take a bulk supply than to install generating plant. During Mr. Pybus's absence, through ill-health, Mr. V. Watlington took up the position of managing director, and performed the duties of that office very satisfactorily, and he had consented to retain it. It was necessary for a company like theirs to have a chairman who could devote practically the whole of his time to the company. Unfortunately, his (Sir Charles's) other engagements precluded that and he had recommended that Mr. Pybus should be appointed chairman and that had been adopted. He felt that with Mr. Pybus and Mr. Watlington devoting their energies to the service of the company, the question of management would be put into the best possible shape. The board had asked him to become deputy-chairman, which he was very glad to do. Mr. W. L. Hichens seconded the motion, which was carried after a short discussion.

Johnson and Phillips, Ltd.

The profit for the past year, after providing for bad debts, and charging to revenue about £21,000 for maintenance of buildings, plant, &c., was £209,897. Adding £127,792 brought forward, less £50,000 paid in dividends in May last, there is an available balance of £287,689. After meeting directors' fees, debenture interest, &c., transferring £43,750 to reserve, and debiting a 7½ per cent. dividend paid in November last, there remains a balance of £152,132. It is proposed to pay a final dividend of 10 per cent. on the old ordinary shares, making 17½ per cent. for the year, and a dividend of 10 per cent. on the new ordinary shares, leaving £92,133 to be carried forward. The premiums in respect of the shares issued in 1924 and 1925, amounting to £106,250, have been transferred to the reserve, which now stands at £250,000. The meeting was to be held yesterday (Thursday).

German Companies.

The *Wolfram Lamp Company*, of Augsburg, proposes to increase the rate of dividend from 6 per cent. to 10 per cent. for 1925.

The *Company for Electrical Undertakings*, Berlin, which is an investment concern, reports net profits of 4,730,000 marks for 1925, as compared with 2,670,000 marks in the previous year, and the rate of dividend is increased from 6 per cent. to 10 per cent.

The *Electra Company*, Dresden, which is financially interested in a number of electrical undertakings, reports net profits of 1,230,000 marks for 1925 as compared with 840,000 marks in the nine months forming the preceding year. It is proposed to pay a dividend at the rate of 10 per cent., as in 1924.

The *Bavarian Aluminium (Innwerk) Company*, Munich, after having written off 660,000 marks for depreciation, has closed its first year's activity with net profits of 862,000 marks, permitting of the payment of a dividend at the rate of 6 per cent. The undertaking has been transferred to the United Aluminium Works Company, which is owned by the Reich, in return for the issue of shares in the latter company.

The *North German Cable Works Company* reports that it would have been possible to have earned moderate profits in 1925 if it had not been for the quietness which set in during the latter part of the year to such an extent that two-thirds of the men had to be dismissed and some departments brought to a complete standstill. After having made provision for depreciation the accounts indicate net profits of 25,000 marks, as against 101,000 marks in 1924, when a rate of 5 per cent. was paid; no distribution is proposed.

The *United Aluminium Works Company*, Lauterwerk (Lausitz), which is a State undertaking, reports that the stock of orders brought into 1925 was comparatively important. Down to May business was brisk at satisfactory prices, but afterwards the rolling mills and makers of aluminium manufactures suffered from the bad economic situation, so that there was a falling off in the receipt of new orders, and prices became depressed. As a consequence the net results, despite the starting of the Toging aluminium works, were only slightly more favourable than in 1924. With the bringing into operation of the latter works the production increased from 11,800 tons in 1924 to 19,400 tons last year. The bauxite mines in which the company is interested were further developed and will ensure a supply of raw material for decades. The accounts show net profits of 3,930,000 marks, as compared with 3,570,000 marks in 1924, and the dividend is maintained at 7½ per cent.

Swiss Companies.

The *Swiss Company for Electrical Industry*, Basle, which is a holding company, reports that the tendency to improvement continued in 1925 and in many respects became strengthened. At the same time the opportunity for the profitable disposal of interests in certain Italian, Czecho-Slovakian and German undertakings had presented itself. The net profits are returned at 4,710,000 fr., as against 2,290,000 fr. in 1924; the rate of dividend remains at 8 per cent.

The chairman of the *Neuhausen Aluminium Company*, speaking at the recent annual meeting, is reported to have stated that the German companies had been able to reduce their debts to the Swiss company by 800,000 fr., but none of them had been able to pay any dividends.

The *Power Transmission Company*, Rheinfelden, which belongs to the A.E.G. and Lahmeyer concern, states that the sale of energy reached an unprecedented level in 1925, although the unfavourable conditions during the current year are exercising an influence on the consumption. After negotiations extending over 16 years the way was made clear to a concession for the establishment of new hydro-electric works of 10,000 h.p. above Rheinfelden at Ryburg-Schworstadt, at an estimated expenditure of 60,000,000 fr. The net profits for 1925 amount to 1,430,000 fr., as against 1,160,000 fr. in the previous year, and the dividend is increased from 8 to 10 per cent.

Belgian Company.—The directors of the *Société Belge pour la Manufacture des Câbles et Fils Electriques* state that after providing for depreciation, the net profits for 1925 amount to 1,000,000 fr., permitting of the payment of a dividend of 25.45 fr. per share on the ordinary capital.

French Company.—The *Société de Construction Electrique*, of Lyons, has declared a dividend at the rate of 8.50 fr. per share gross out of net profits and balance forward amounting to 471,000 fr. in 1925.

Dutch Company.—*Philips Glowlamp Works.*—It is reported that the directors of this company are again declaring a dividend of 16 per cent. upon the common stock.

Stock Exchange Notices.—The undermentioned have been ordered to be officially quoted:—

Ever-Ready Co. (Great Britain).—49,800 ordinary shares of £1 each, fully paid, Nos. 449,001 to 498,800.

Oxford Electric Co.—100,000 ordinary shares of £1 each, fully paid, Nos. 1 to 100,000; and 55,000 5 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1 to 55,000.

South-eastern Power and Light Co.—$22,228,800 6 per cent. gold debentures, Series "A," Nos. M1 to 18,098 ($1,000), D1 to 8,000 ($500), and C1 to 1,308 ($100).

Stewarts & Lloyds.—39,130 deferred shares of £1 each, fully paid, Nos. 4,035,580 to 4,074,709.

Traction and Power Securities Co.—£34,964 4½ per cent. debenture stock.

Application has been made to the committee to allow the following to be officially quoted:—

Electrical Finance and Securities.—76,162 shares of £1 each, fully paid, Nos. 1 to 76,162.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Midland Electric Corporation for Power Distribution.—70,000 new ordinary shares of £1 each, issued at par, partly paid and fully paid, Nos. 280,001 to 350,000.

Oxford Electric Co.—100,000 ordinary shares of £1 each, fully paid, Nos. 1 to 100,000; 55,000 5 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1 to 55,000.

South-eastern Power and Light.—$10,000,000 6 per cent. gold debentures, Series "A," within Nos. M1 to 18,098 ($1,000), D1 to 8,000 ($500), and C1 to 1,308 ($100).

Stewarts & Lloyds.—39,130 deferred shares of £1 each, fully paid, Nos. 4,035,580 to 4,074,709.

Traction and Power Securities Co.—£34,964 4½ per cent. debenture stock.

National Electric Construction Co., Ltd.—The report for 1925 shows a profit of £21,891, and after deducting debenture interest, depreciation, &c., and adding £4,721, there was an available balance of £21,137. It was recommended that this balance should be dealt with as follows:—To reserve and renewals account, Dewsbury and Ossett Tramways, £1,000; to dividend-equalisation reserve, £1,000; to general reserve, £7,000; dividend of 10 per cent., £6,747; carried forward, £5,390. The dividends from the undertakings in which the company is interested were well maintained and the profit from contracting work was again satisfactory. The meeting was to be held yesterday (Thursday).

Northern General Transport Co., Ltd.—In his speech at the annual meeting, on April 22nd, the chairman (Mr. R. J. Howley, C.B.E.), dealt principally with the motor omnibus side of the company's affairs. Referring to the tramway undertakings, he said that the Gateshead & District Tramways Co. and the Tynemouth & District Electric Traction Co. continued to do well, but he thought that the position of the Jarrow and District Electric Traction Co. could not be expected to show improvement until the shipbuilding industry recovered to a substantial extent. The report and accounts were adopted and subsequently a resolution was carried increasing the capital of the company to £700,000.

Sir W. G. Armstrong, Whitworth & Co., Ltd.—The directors have decided not to pay any further dividends on any of the preference stocks in respect of the year 1925.

Indo-European Telegraph Co., Ltd.—The report for the past year showed that the revenue increased from £294,371 in 1924 to £310,345. After providing for taxation and adding £18,779 brought forward there remained a balance of £133,838, which it was proposed to distribute as follows:—Writing down cost of reconstruction of the line in Russia and Poland, £5,000; a final dividend of £1 2s. 6d. per share, making 7 per cent. for the year, and a bonus of 15s. per share, both free of tax; £5,000 to dividend-equalisation fund; and £15,000 to retirement trust fund, leaving £16,339 to be carried forward. The meeting was to be held yesterday (Thursday).

Melbourne Electric Supply Co., Ltd.—The report for a period of fourteen and two-fifths months ended November 12th, 1925, shows a balance at the credit of profit and loss account of £567,610, as compared with £414,071 for the preceding 12 months. After providing for debenture interest, &c., and adding £23,336 brought forward, there is an available balance of £449,059. Of this £270,988 is transferred to general reserve, £20,000 to income tax reserve, £4,000 to reserve for bad debts and £10,000 to staff pension fund. A final dividend of 5 per cent. actual has been paid on the ordinary shares, making 10 per cent., free of tax, for the year ended August 31st, 1925.

Babcock & Wilcox, Ltd.—In presenting the report for 1925 (*vide* Elec. Rev., April 16th, p. 630) at the annual meeting on April 20th, the chairman (Sir John Dewrance) said that the company was fortunate to be able to show such good results at a time of severe depression in the engineering industry. He hoped that no further labour troubles would supervene to worsen the position. If the threatened engineering strike could be averted and the trouble in the coal industry cleared up, there was every prospect of an even more satisfactory year for the company.

City Electric Light Co., Ltd.—The report of this company (of Brisbane) for the year ended January 31st last showed that after making provision for sinking fund, renewals, &c., and adding a sum of £17 brought forward, there remained a balance of £104,875. Out of the year's profits the directors paid an interim dividend in September last, amounting to £50,288, and they recommended a further dividend of 3 per cent. upon the 6 per cent. preference shares, 3½ per cent. on the 7 per cent. preference shares, and 5 per cent. on the ordinary shares, in proportion to the amount paid thereon, free of State tax. This absorbed £54,535, leaving a balance of £52 to be carried forward.

Urban Electric Supply Co., Ltd.—The directors' report for 1925 records a profit of £91,905, to which is added £10,892 brought forward, making £102,797. After paying the interim preference dividend and purchasing £74 of funded certificates, it is proposed to place £35,000 to depreciation reserve, £10,000 to general reserve, to pay the final preference dividend, to purchase £1,250 of funded certificates, and to pay a dividend of 7 per cent. on the ordinary shares, leaving £18,683 to be carried forward. The meeting was to be held yesterday (Thursday).

Greenock and Port Glasgow Tramways Co., Ltd.—The surplus for 1925, after providing for renewals, &c., is £2,766, and the addition of £689 brought forward makes available £3,456. It is proposed to transfer £1,084 to reserve and to carry forward the balance (£2,372). The company has purchased motor omnibuses to combat competition. During the year mortgages were redeemed to the extent of £32,500, and £33,999 released from sinking fund was transferred to reserve. Meeting: May 3rd.

Hadfields, Ltd.—The report for 1925 states that the company, in common with others, suffered during the year from the severe cutting of prices. The directors recommend a dividend of 3 per cent. on the ordinary shares, leaving £83,204 to be carried forward. The company has acquired approximately three-quarters of the share and debenture capital of Messrs. A. Harper, Sons & Bean, Ltd., and a satisfactory return is expected. Meeting: To-day (Friday).

Newmarket Electric Light Co., Ltd.—The directors' report for 1925 stated that the balance on the year's working, after providing for debenture interest, depreciation, &c., amounted to £3,248, and the addition of £485 brought forward gave an available balance of £3,733. A dividend of 8 per cent., free of tax, is paid, £1,000 is transferred to general reserve, and a balance of £608 is carried forward.

Prospectus.—*Northampton Electric Light and Power Co., Ltd.*—The directors have issued to shareholders particulars of and forms of application for 70,000 ordinary "B" shares of £1 each at 27s. per share. Renunciation letters accompany the prospectus. The issue is to provide capital to meet rapidly increasing business. Applications have to be sent to the Bank by May 12th.

Swansea Improvements and Tramways Co., Ltd.—The net profit for the past year, after providing £20,000 for renewals, was £13,847—an increase of £534. A dividend of 6 per cent. (as for 1924) is being paid on the ordinary shares, £3,000 is put to reserve, and £7,969 is carried forward.

G. D. Peters & Co., Ltd.—The report for 1925 shows a net profit of £7,203, to which is added £3,316, including the sum brought forward. After meeting taxation and paying the preference dividend for the first half of the year, it is proposed to carry forward £4,150.

Herbert Morris, Ltd.—A dividend at the rate of 7½ per cent. per annum has been declared on the ordinary shares for the half-year ended January 31st last.

Montreal Light, Heat and Power Co.—A dividend of $2 per common share has been declared in respect of the quarter ending April 30th.

Stocks and Shares.

Monday Evening.

The Budget influences at work in the Stock Exchange were slight as compared with those exercised by the varying phases of the coal crisis, which change from day to day in such a fashion as to render markets cheerful in one session and disconsolate in the next. With the outlook altering almost hour by hour according to the results of the various meetings which are being held, it is not possible to expect Stock Exchange business to show expansion. There are, however, some markets in which activity prevails, and amongst these the section devoted to Underground Electric issues is the hub of lively speculation and speculative investment.

Following upon the rise of last week, the Underground £10 shares are another ⅛ up at 3⅞, while the "A" hold their gain at 12s. A fair amount of attention is being devoted to the company's 6 per cent. income bonds, the dividends on which are paid, of course, free of tax. Being an income bond, the interest is dependent upon the earnings of each half-year, and this gives the stock its speculative flavour. It is within comparatively recent years that the bonds have received their full 6 per cent., but in view of the progress made by the company, they are now worth including in any sound list of speculative securities that yield a good return on the money. The likelihood of capital appreciation is bounded by the consideration that, in a reorganisation scheme of the company's capital, these bonds might be repaid at par. London and Suburban Traction preference are better, while London United Tramway debenture is left at 48.

St. James' and Pall Mall shares have come into demand, and at 16⅛ are 5s. up. Westminsters are better at 43s. 3d. Chelseas rose to 2, and City of London ordinary to 45s. 9d. Urban ordinary and preference have moved up. The moderate stream of selling which has been going on in the electricity supply share market for some time past, and for which the Government's Bill has been responsible, is now less obvious, and the effect of the demand from investment becomes apparent in these improved quotations. The provincial shares are better with those of the London companies. Midland Counties ordinary have recovered to their par value. Yorkshire Electrics are 1s. up at 27s. 6d. Bournemouth and Poole show a nominal fall at 55s. 9d., but this is ex dividend and bonus, so that the net result is negligible. Electric Supply Corporation shares have recovered the dividend deducted from the price last Thursday. The market as a whole may be described as stronger than recently has been the case. The Budget is favourable, rather than otherwise, to gilt-edged and investment issues. The Chancellor of the Exchequer has dealt but light blows to the Stock Exchange this time.

The General Electric Company is about to divide its existing 1,850,000 common shares of $100 each into 7,400,000 stock of no par value. It may be remembered that the company holds the controlling interest in the British Thomson-Houston Co., Ltd. The Americans are fond of the "no par" value denomination for stocks and shares, though the British investor is not sufficiently familiarised with the system for it to attract support on this side. One of the objections heard against it is that, where shares are of no par value, this opens an easy door to manipulation of prices in the market. Many of the best-class American companies, such, for instance, as the General Electric, having adopted the principle, the latter is likely to become better known in this country by reason of the favour with which some British investors regard stocks and shares in American companies, which are held to be less liable to labour disturbances than those which trouble our domestic industries.

The telegraph market is steady, though Great Northerns are another £1 down on top of the £2 fall which they suffered last week. Indo-European hold their advance. The company's report shows a profit of £123,000, an increase of about £12,000 on the previous year's figures. The bonus, as we mentioned last week, has been increased. Oriental Telephones are a little harder. Automatic Telephones, nominally 1/16th lower, are actually unchanged, the price being now ex dividend. Marconis lack public interest and the group is quiet.

Anglo-Argentine Trams are a good market, although no further developments have occurred so far as published information goes. There is an impression that the trouble between the Buenos Aires Municipality and the company is in a fair way to becoming settled. Brazilian Tractions are better, and Meixcan Light preferred show a gain of 3 points. The company's common shares are, however, 2 down at 29½.

Amongst manufacturing shares, Telegraph Constructions have lost 10s., but apart from this decline the list is not bad. Babcocks, now ex dividend and bonus, are quoted at 50s. Johnson & Phillips strengthened, and English Electrics further hardened as a result of the meeting. Rubber shares enjoyed an all-round advance on the Colonial Office modification of the Stevenson scheme. The alteration fixes 1s. 9d. per lb. as the pivotal price around which the next change of exportable allowance shall revolve. The move came as a very pleasant surprise to the market, and completely changed the previously dull complexion of prices. It is taken for granted that there will be a loud outcry of protest from American consumer interests.

Works and Staff Magazines.—The Fifth Conference of Editors of Works and Staff Magazines, organised by the Industrial Welfare Society, was held in Caxton Hall, Westminster, on Friday last. Since 1920, when the first of this series of conferences was held, the attendance has increased steadily, and over 100 firms were represented by about 120 delegates on this occasion. Papers were read and discussed, and at a luncheon in connection with the Conference, at the Hotel Rubens, Sir Ernest Benn, C.B.E., and Captain Harold Macmillan, M.P., addressed the delegates.

Standardisation in Australia.—A conference of secretaries of the Australian Commonwealth Engineering Standards Association, established towards the end of 1922, was held in February, officers from headquarters (Sydney), from Adelaide, Brisbane, Melbourne and Hobart being present. The chairman (Mr. E. S. Maclean) drew attention to the rapid progress of work and growing support in introducing the principles of standardisation into industry. From a report by the engineer-secretary, Mr. W. R. Hebblewhite, the *Melbourne Age* noted that 153 sectional, sub- and panel committees have been constituted, involving a total membership of approximately 1,000. No fewer than 138 specifications were under consideration, of which 27 had been published, and 15 would be issued shortly. The subjects included machine parts, electrical material, railway and tramway rails, rolling stock material, and colliery equipment. A complete organisation had been established to complete a survey of the power resources of Australia with a view to making recommendations for its utilisation. State Governments had been very sympathetic, and officers of various departments had been encouraged to assist the various sub-committees.

The New Metro-Vick Showrooms.

Facilities for Contractors.

The recently-opened showrooms and offices of the Metropolitan-Vickers Electrical Co., Ltd., and Metro-Vick Supplies, Ltd., in Charing Cross Road, W.C.2, are an excellent example of their kind, being situated in an almost ideal position, and possessing ample space for the correct display of fittings and appliances. The premises were formerly employed as a pickle and preserve factory by Messrs. Crosse & Blackwell. The substantial outer walls have been retained, but the interior has been reconstructed to meet the new requirements. There is a basement, the ground floor and four storeys above, and distinction is added to the building by a turret at the corner seen from the busy Oxford Street, upon which illuminated signs have been fitted. The corner of the ground floor directly beneath the turret has been equipped with attractive open windows, in which appliances are displayed and illuminated at night by an efficient window-lighting system. The outer showroom is handsomely panelled in walnut, and the floor is covered with rubber tile flooring. The main showroom, three views of which are reproduced herewith (figs. 2, 3 and 4), is a very spacious apartment, and the decorative scheme has been admirably carried out. Each lighting fitting is given plenty of room (which is not always the case), and can be seen to advantage. In the centre of the showroom is a glass-panelled case, in which a selection of domestic appliances, &c., is shown.

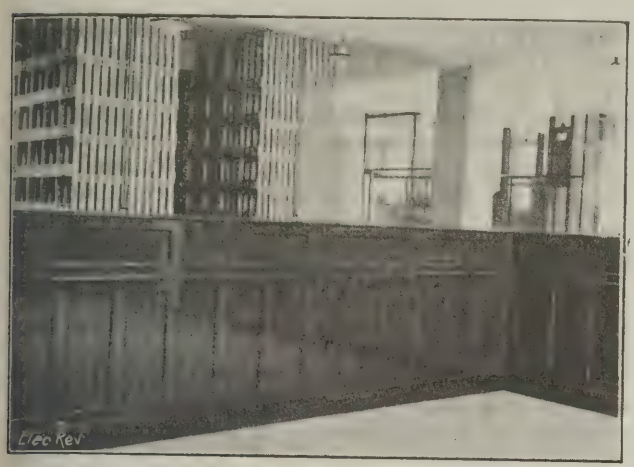

Fig. 1.—The Trade Counter.

Fig. 2.—A View of the Main Showroom.

Figs. 3 and 4.—Corners of the Main Showroom.

The exhibits include radio apparatus, but actual demonstrations of this are carried out in a smaller adjacent room. The store-rooms are capacious, and enable large supplies of lamps, fittings and appliances to be held at the premises. The trade counter (fig. 1) is conveniently situated, and in consonance with the rest of the arrangements, is of ample dimensions leading to quick service. The furnishing of the main showroom was carried out by Messrs. Waring & Gillow, Ltd., to the designs of Messrs. Yates, Cook & Darbyshire, and the floor-coverings were supplied by Messrs. George Spencer Moulton. The wiring and lighting arrangements were carried out by The Engineering Works (Electrical and General), Ltd., under the supervision of the Illuminating Engineering Department of Metro-Vick Supplies, Ltd. Messrs. Harcourts, Ltd., a subsidiary of Metropolitan-Vickers, provided the interior art-metal work. The facilities thus provided are for the trade only. Books of introductory tickets for the use of contractors' customers are being provided.

Metro-Vick House is situated near the Tottenham Court Road "Underground" station, and there are numerous services of omnibuses passing the premises.

The facilities provided for trade customers include an illuminating engineering department, and a writing room with stenographic service. The bulk of the building is occupied by the services of Metro-Vick Supplies, Ltd., but a number of the departments of the Metropolitan-Vickers Electrical Co., Ltd., are also housed there. These are:—The offices of the motor and plant department; meter office, stores, and testing laboratory; and the London erection stores and offices.

Exports and Imports of Electrical Goods and Machinery in March, 1926.

THE Board of Trade Returns of our foreign trade in electrical goods during March, although not very satisfactory in comparison with the preceding month, show up better against the March, 1925, figures, which is, no doubt, a fairer comparison in view of seasonal fluctuations. The exports declined by £99,275 from the February level. The decrease was fairly general, but was considerably off-set by four increases, the most important of which occurred in the case of submarine, telegraph and telephone cable (£45,552). The exports of batteries and accumulators, insulated wires and cables, unenumerated electrical machinery and "other" motors and generators showed very considerable decreases. The machinery section exhibited smaller exports in all classes, but in the telegraph and telephone section there was a substantial rise. Comparing the figures with those of March, 1925, it is seen that increases and decreases were balanced between the items. Insulated wires and cables make the most satisfactory showing, but the machinery section displays a decline, while the telegraph and telephone section shows a rise.

Turning to the imports, it is observed that only three decreases occurred, the most marked of which was in telegraph and telephone instruments. The largest increase was in the case of unenumerated electrical machinery, and here, it may be pointed out, the rise in imports was almost exactly the same as the fall in exports. Another important class in which larger imports were recorded simultaneously with smaller exports was insulated wires and cables. As compared with March, 1925, the decreases preponderated in number and value, the largest being again in the case of telegraph and telephone apparatus. Insulated wires and cables experienced the greatest increase.

The re-exports show a considerable rise in both comparisons, the increase being fairly generally distributed.

All three sections, comparing the first three months of this year with the corresponding period of 1925, show decreases, but it is satisfactory to note that the fall in exports is considerably outweighed by that in the import section.

Electricity Supply in the United States.

An Interesting Address by Mr. Samuel Insull.

AT a luncheon given by the American Chamber of Commerce in London (Inc.) at the Hotel Cecil on Thursday last week, the hon. treasurer, Mr Robert Grant, Junr., presiding, Mr. Samuel Insull, of Chicago, U.S.A., was the guest of honour. Amongst the many other guests were Lt.-Col. Wilfrid Ashley, M.P., Minister of Transport, Lt.-Col. J. T. C. Moore-Brabazon, M.P., Parliamentary Secretary to the Minister of Transport, Mr. H. E. Levis, Maj.-Gen. Sir Philip Nash, K.C.M.G., Mr. C. H. Merz, Dr. H. F. Parshall, Mr. George Balfour, M.P., Mr. T. P. O'Connor, M.P., Mr. S. J. Goddard, Mr. R. A. Chattock, Pres. I.E.E., and Mr. O. D. Young, chairman of the General Electric Co. (U.S.A.), and of the Radio Corporation of America.

In a brief address on electricity supply in the United States, Mr. INSULL said that the conditions there were different from those obtaining in this country; their methods of controlling local monopolies were different from ours, and where we had to go to Parliament for sanctions, they went to the Commissioners of the respective States. The difference in conditions had something to do with the progress of development of power supply; moreover, the United States was a young country, with less respect for vested interests, and hence electricity supply had gone ahead there far more rapidly than in Britain. Up to a certain point, the development had followed similar lines. When Mr. Insull entered the business, there were several systems operating in the same city, due to the popular belief in the virtues of competition—which, however, was disastrous both to the suppliers of electricity and, still more, to the users, owing to the resulting increase in cost; but the city areas were gradually provided with a good supply of electricity. The larger developments dated from the introduction of the steam turbine; Sir Charles Parsons was largely responsible for the modern system of "massing" electrical generation. Dr. Ferranti, too—20 years before his time—had shown the way to the mass production, transmission, and distribution of electricity, whilst Dr. Hopkinson had shown them how to sell it, the instrument which enabled them to arrive at a just scale of charges being also the invention of an Englishman, Mr. Arthur Wright. Thus, much of the information required to put electricity supply on sound lines came from this country.

The massing of production led to the development of general power supply systems over large areas. Round the city of Chicago, in an area of 10,000 square miles, a population of four millions absorbed only 10 per cent. less electricity than the whole of the United Kingdom, though the investment in generating plant was only half as great. The mass production

or "super-power" idea was spreading rapidly in the United States; from Minneapolis to Virginia, and across the Alleghanies, practically the whole region (with very few interruptions) was connected in one vast super-power or "grid" system. The effect of that was to enable them to take advantage of the water power in Wisconsin supplemented by the steam plant in Chicago and the Lake Michigan area, small plants on the coal fields, larger ones on the Ohio River, &c. That was a territory larger than the United Kingdom. Farther south, there was a large interconnected area where the steam plants of Alabama helped out the industries that depended on the water power of North Carolina. On the Pacific Coast, from Canada to Mexico, there was one vast power system, over which energy was transmitted as far as 250 miles in some cases. Power produced very cheaply in the mountains was carried to the great cities over long transmission lines at very high pressures. It was a common thing to see interests financially unconnected, feeding into a common network. The result was that they could build huge power plants and run them with a minimum consumption of fuel.

In five years the fuel saved by the increased efficiency of generating plant in the United States amounted to 60 million tons of coal, a saving of one-third; and the Commonwealth Edison Company carried on through the war without increasing its rates, largely as the result of the higher efficiency of the apparatus employed.

The interconnection of distribution systems allowed of the massing of production in plant of the highest possible efficiency and of large size. A common size of turbo-generator was 40,000 kW; in larger stations they were installing sets of 60,000, 75,000, and 80,000 kW. In a new station for which they were just breaking ground, the first set would be of 200,000-kW output. A low cost of power was attained not only in big centres but also in small communities, and would have a notable effect on social conditions. Mr. Henry Ford had in view a scheme for the manufacture of motor-car parts in rural areas. By cheap power they hoped to check the drift from the country to the town; by supplying electric light and power to farmhouses, they would change the conditions of living entirely. The availability of cheap power in small communities would lead to the old-fashioned method of specialising in local manufactures. The conditions under which children could be brought up would be improved, and the vast movement going on in America quite possibly might largely revolutionise the conditions under which people lived in country towns.

The question was of peculiar importance to Britain. They were subject to drastic regulations and much interference with business in the United States, which would be distasteful to Englishmen, but they profited by close contact with the members of the Public Service Commissions; in America there was less protection from competition than in this country, but they went ahead with the work as a commercial proposition. He believed in the system, because more money could be made on that basis than out of isolated undertakings—it was all a question of dollars and cents. The right policy of any man serving the public was to supply it at the lowest price that would return a reasonable profit.

No man ever forgot his mother country. The United States was to him the country of opportunity, the country of adoption—he wished the country of his birth to profit by the experience gained in the country of his adoption. He was not talking on theoretical lines, but as one responsible for nearly 250 millions sterling of securities in the hands of the public, and he hoped his electricity supply friends in this country would put aside all selfish interests and even make sacrifices in order to give Britain the service she was entitled to.

The Chairman expressed the thanks of the gathering to Mr. Insull for his address, and Mr. T. P. O'Connor proposed the health of the Chairman, which was heartily honoured.

Australian Industry and Tariffs.

The Position of Electrical Manufacturing.

By G. A. JULIUS, B.Sc.

(*Abstract of a Presidential Address before the* Institution of Engineers, Australia.)

We live in an age of manufacturing and that nation is the wealthiest which produces the greatest quantity of manufactured goods with its available labour. Accordingly, Australia aims at being a manufacturing nation, and in recent years a determination has been manifested to make the country self-supporting in every way. Factories have sprung up everywhere and the Federal Government has aided the movement by the imposition of tariffs, the granting of bounties and other means. Here and there, however, a doubt is being felt whether the system is a right one. It is seen that the debt per capita has risen to an enormous extent; that the wages paid have risen to a similar extent and are still rising; and that the average productive activity over all industries is steadily falling. Looking at the experience of Great Britain and the United States it is apparent that the former's development and use of the steam engine was the factor which made her the mistress of the world's wealth. While, however, her rise of recent years has been very steady, enormous advances have been made by the United States. The accepted reason for this is that Great Britain is not now using sufficient mechanical power in her industries to get the most out of her workers. Legislative restrictions have retarded the growth of electricity supply until now Great Britain lags behind the United States in this respect, although steps are being taken to remedy this. America has developed the use of electricity so that now war-time efficiency and economy are permanent conditions of her industrial and home life. The curve of prosperity in the United States has closely followed that showing the increase in the use of power in industry, and this is not due to the protective tariffs which have been imposed upon foreign goods. Statistics show that the American workman adds a value of £600 in the process of manufacture when provided with 3¾ h.p., while the wage earner in Australia, having less than 1½ h.p. to assist him, adds a value of £322. For every £1,000 spent in wages approximately £2,400 is added to the value of the product in America, as against £1,750 in Australia, in spite of the fact that wages are materially higher in the United States. It is obvious that the industries which employ the largest amount of power produce the greatest wealth, and that those which use little power produce a correspondingly small value per capita. Unfortunately many of the industries employing the largest number of people are among the smallest users of power and it is possible that the application of more power is impracticable. The Australian Government should give every possible encouragement to those industries which use the largest amount of power. Australia stands high as regards "real wages" but this does not appear to be due to increased quantity production, whereas in the United States this is the direct cause of the high wages paid. The statistics reveal that the position of Australian manufacturing industries is not so good as might have been expected, and it would appear that too little use is being made of mechanical power. Everybody should think, talk and act in terms of "more power," since under modern industrial conditions it is mechanical power which creates wealth, and the prosperity of the people is regulated to a considerable extent by the amount of power consumed. The aim should be the expansion of the larger and more efficient factories instead of the increasing of the large number of small establishments. The existing Customs tariff merely encourages any small factory to start that undertakes to make anything at all, necessary or otherwise. The present tendency is well illustrated by the Australian electrical industry which in 1924 was divided up amongst 193 establishments employing 2,641 persons. Of these 55 employed fewer than four hands each, 162 employed fewer than 20 persons each, and only two reported the employment of over 100 persons. Experience teaches that the manufacture of electrical apparatus can only reach its proper effectiveness when carried out under large-scale operations. Unless the industry is organised and carried on in a big way, its products are little more than the output of hand labour, with consequent high costs and loss of efficiency in the utilisation of labour. Comparing the Australian electrical industry with that of the United States, it is seen that the h.p. installed per employé is less than ½ as against 2. The added value in 1923 for each £1,000 spent in wages was £2,428 in the United States and £1,465 in Australia. Between 1909 and 1923 there was actually a decrease in Australia in the added value per £1,000 of wages, while in the United States there was an increase. In the Australian electrical industry, too, there has been practically no increase in the power installed per employé, whereas in all other industries it has increased from ¾ h.p. in 1908 to about 1½ h.p. in 1924. Disregarding consideration of the small market in Australia, the necessity for continuous changing of methods and designs must seriously handicap the establishment of electrical manufacturing plants on any adequate scale at present. One of the most potent factors in the remarkable development in electrical engineering in our generation has been the organisation in the older countries of a relatively small number of very large companies, with enormous financial resources, which have enabled them to maintain highly-trained specialists in every branch of design, and their business is of such magnitude that the development cost does not bear unduly on any single product. The establishment of branch or associated factories of home concerns can be considered, but apart from the heavy overhead expenses, it is apparent that, except in particular cases, apparatus thus fabricated in two factories could not be produced as cheaply as if wholly turned out by one factory. Electrical goods, in general, are merely tools for other industries; they should therefore be produced as cheaply as possible. Australia's large debts and

her urgent need of development raise a pressing demand for the creation of national wealth, and this involves the highest efficiency in the utilisation of labour. While the Commonwealth cannot look forward to any material export trade in electrical manufactures, she already exports large quantities of valuable materials which could be worked up into a condition of higher value before shipment.

In 1923-24, Australia paid nearly £859,000 in duty on electrical apparatus, nominally to protect electrical manufacturers in the country, and in 1921 the amount was nearly £933,000. The number of persons employed in the industry was 2,641, with an average wage of £174 per annum, but the total cost to Australia—that is wages and duty together—was £521 per employé. The value added per employé was only £243. Taxation to support the electrical industry was therefore far in excess of the wealth produced by the industry, and undoubtedly retarded the introduction of power into other industries and checked progress. It is calculated that since 1907 an amount of £6,500,000 has been paid in duty on electrical plant (excluding wires and cables). This represents an annual burden of £650,000, and it is now increasing at the rate of £85,000 per annum Not only has this affected industry; it has also retarded the use of electricity in the home, for domestic appliances, particularly cooking ranges, carry a price which makes their use impossible for the majority of people. The main result of the present system is to enhance the cost to the consumer. While it is true that there are electrical factories which are worthy of all possible assistance, there is overwhelming evidence to show that the present method of extending assistance to manufacturers has failed of its purpose. The minor interest of the electrical manufacturer has obscured the major interest of the light and power industry. Although large power-producing installations are being erected, the present policy will rob them of all possibility of real success. The manufacture of electrical apparatus in Australia can never be worth while until a real demand has been created for such apparatus, and this demand can never be created unless the material is available to the public at a reasonable price. The continued starting up of small organisations is unhealthy and can never lead to success.

The issues at stake are so great, and Australia will continue to lose so much if the present policy is adhered to, that there are good grounds for believing that the Government will be ready to handle this question along strictly business lines and to devise some solution for the problem, bearing in mind that whatever plan may be devised its first responsibility is to the people as a whole. If the latter ground were the sole consideration, the correct solution would appear to be absolute free trade so far as essential electrical equipment is concerned. It is noteworthy that New Zealand has practically adopted this policy, admitting the majority of essential electrical apparatus free if British, or with a 10 per cent. duty if foreign. The author ventures to think that if no other satisfactory solution can be found it would be in the interests of an overwhelming majority of the community if such a policy were adopted by Australia, realising, of course, that a relatively small number, the local manufacturers of electrical equipment, would suffer. It is believed, however, that a way can be found which will secure the desired and essential result, without sacrificing the interests of those engaged in electrical manufacture, wherever it is proved to be worth while. That is by the establishment of a system whereby a bounty would be given for such approved articles as were manufactured in Australia. The money saved in duties would more than cover the relatively small sum of money necessary to cover the bounty. By this means it is considered that the development of electrical manufacturing works would be greatly accelerated. For the immediate future the co-operation should be invited of all electrical manufacturing companies, both Australian and otherwise, to assist in educating the Australian people to an appreciation of the domestic and industrial advantages which must accrue from a greatly increased use of electricity.

The Rugby Radio Station.

An All-British £400,000 High-power Telegraph Station.

By E. H. SHAUGHNESSY, O.B.E., M.I.E.E.

(Abstract of Paper read before the WIRELESS SECTION *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

WHEN the Government decided upon the provision in England of a wireless station with a world-wide range, the Wireless Telegraphy Commission which was originally appointed under the chairmanship of the late Lord Milner with Dr. W. H. Eccles (vice-chairman), Mr. E. H. Shaughnessy and Mr. L. B. Turner as members, undertook its general design and Post Office engineers prepared detailed drawings and designs for the equipment as a whole and for most of the plant.

Fig. 1.—The Main Station Building.

To ensure reliable communication when working on a wave-length of about 18,000 m. (16.66 kilocycles) a minimum working current of 500 amperes in an aerial supported on 820-ft. masts would be required, and it was decided that the high-frequency generating valve plant should be capable of dealing with an input of 1,000 kW to provide for a possible necessary low working efficiency of 50 per cent. Such an installation would produce an aerial current of about 700 amperes to meet bad atmospheric conditions. It was decided to erect in the first instance an aerial having a designed capacity of 0.045 μF on 12 insulated 820-ft. masts and to ascertain its limitations. The station buildings are about the centre of the site which has an area of 900 acres (about 1½ miles long by 1 mile wide) at Hillmorton, about four miles south-east of Rugby.

Power Plant.—Electricity is purchased in bulk from the Leicestershire and Warwickshire Electric Power Co., the incoming supply being 3-phase, 50-cycle, with an earthed neutral and 12,000 volts between phases; automatic regulators are installed at the company's sub-station.

All larger motors (*i.e.*, over 100 kW) are synchronous machines capable of operating on 0.9 leading power factor and as a result the station can be operated on unity power factor.

The e.h.p. a.c. 6-panel switchboard consists of 5 truck cubicles and a metering cubicle, two being connected to the auxiliary 450-kVA transformers situated immediately below the switchboard, whilst a third (of 2,000-kW capacity) controls the main motor-generator sets. The low-pressure, a.c., 416-volt switchboard is of the normal slate pattern containing 16 panels, and controls all auxiliary power. These switchboards, together with a number of others and cabling, were supplied by the General Electric Co., Ltd.

The valve transmitter set called for a supply of d.c. power of from 1,000 to 1,500 kW at from 10,000 to 18,000 volts, with the negative side at earth potential, the higher voltage being provided to cope with probable developments in transmitting valves in the near future. Owing to the possible failure of valves, it was essential that whatever type of plant was installed it would have to be capable of standing a dead short-

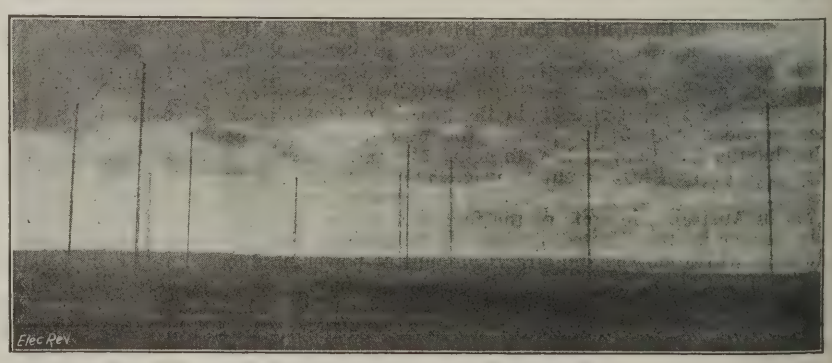

Fig. 2.—A General View of the Masts.

circuit with impunity. Other special requirements were ability to operate under rapidly fluctuating loads, low self-inductance, and absence of voltage ripple, and it was finally decided to install motor-generator sets manufactured by the British

Thomson-Houston Co., Ltd. Three sets are provided, fig. 3, each having an output of 500 kW at 6,000 volts d.c., and consisting of a three-phase self-starting synchronous motor of 640 kVA wound for 2,200 volts between phases, rigidly coupled to two d.c. generators connected in series, and two exciters, one of which is the main exciter and the other the motor field exciter; the main exciter provides field current for both d.c.

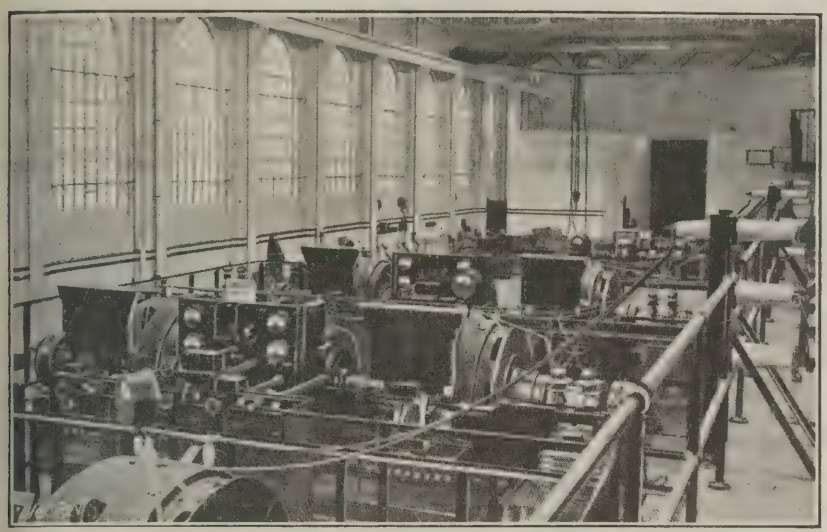

Fig. 3.—Main Motor-generator Room.

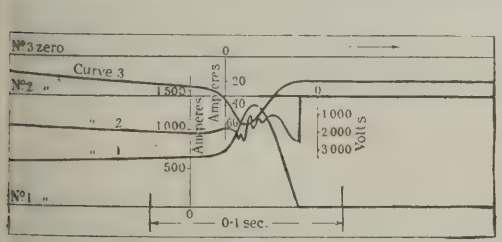
generators and for the field of the motor exciter. Each d.c. generator is a bipolar machine of 250 kW at 3,000 volts, provided with interpoles and compensating windings. The magnet frames of cast steel are split diametrically and in order to avoid awkward joints in the pole-face windings the break has been arranged through the centre of the main poles which consist of twin poles, each half carrying its own spool. Another unique feature of the magnetic circuit is a band of laminations incorporated in the yoke to provide an unlamped path for the commutating flux under rapidly varying loads. The commutator is of the same diameter as the armature, and all metallic parts in the vicinity of the commutator which are connected to the frame are protected by insulating shields. A series of fan blades mounted between the armature and commutator provides a blast of air across the commutator. The brush gear is completely encased in bronze boxes, the connections to which produce magnetic fields directed to blow out from the machine any arc which may be formed at the brushes.

In order to avoid the use of insulated couplings between motor and generators, each set is supplied with power through a separate transformer, manufactured by Messrs. Johnson and Phillips, wound for 2,000 volts on the primary side and 2,200 volts on the secondary side. The insulation of the secondary winding from the primary winding and core bunched was subjected to a flash test of 50,000 volts. The secondary side is connected directly to the motor terminals by means of a 3-core paper-insulated cable, and all a.c. switchgear is on the primary side of the transformer. The base-plates of each set are insulated from earth by being mounted on groups of porcelain insulators. The neutral point of the motor stator is connected to the base-plate as is also the mid-point between the d.c. generators through a leakage relay. In this way the potential of any portion of the set relative to the frames is limited to 3,000 volts d.c. When working in series each set has a base-plate potential corresponding to its position in the circuit; thus, the first base-plate will be at 3,000 volts, the second at 9,000 volts and the third at 15,000 volts above earth in each case. Each main base-plate carries two high-speed circuit breakers, each connected in series with a generator armature, set for instantaneous tripping on about 5 times full-load current; it inserts a blocking resistance in circuit and at the same time trips the generator field contactor, the contacts being fully opened within 0.02 sec., whilst in order to suppress the generator fields as rapidly as possible the field contactors open the circuit without inserting discharge resistances. Each set is completely surrounded by an earthed metallic screen and the foundations contain a metallic network which is connected to the earthed screens. All controls are operated by means of insulated spindles from outside the screens. The e.h.p. d.c. terminals of each set are connected to a 2-position selector switch mounted on a gallery carrying the busbars; in one position the switch connects the machine in series with the busbars, whilst in the other position the machine is isolated and the gap in the busbars bridged. The switch cubicles were supplied by the British Thomson-Houston Co., Ltd. In spite of the large dimensions of the machines for their output, necessitated by voltage requirements, the test-results showed an over-all efficiency of over 87 per cent.

In addition to the ordinary tests, the machines were subjected to short-circuit tests while fully excited; in the case of one set this test was repeated 20 times, in all cases without flash-over or damage of any kind. A copy of oscillograms taken on a single set by the B.T.-H Co. is shown in fig. 5.



The d.c. supply from the busbars is transmitted to the valve room through armoured concentric paper-insulated cables, the inner conductor in each case being the h.p. conductor, whilst the outer conductor carries the return current at approximately earth potential. The cables terminate in a steel cubicle switchboard supplied by the General Electric Co., Ltd., and the use of oil circuit-breakers to rupture h.p. d.c. circuits is thought to be a novelty, but tests on short-circuits of 18,000 volts showed that the switches could successfully clear a fault without damage.

Fig. 4.—Power Valve Units, Exciter Panels, Control Desk and Auxiliary Switchboard (Right).

The valve-filament supply of the station is obtained from two 200-kVA frequency-converter sets, each consisting of a 416-volt, 50-cycle synchronous motor driving a 200-kVA, 354/478-volt, 100-cycle, three-phase alternator. Each set is provided with a pony motor and exciter. Tirrill regulators on each alternator control panel limit a.c. voltage fluctuations, and as an additional safeguard the regulators are fitted with excess-voltage cut-outs to provide against the possible failure of the regulator. The voltage maintained by the Tirrill regulators can be varied by remote control from the valve room.

an emergency lighting supply, a small secondary battery has been installed with 30-kW charging generator and booster sets in duplicate. All circuits and machines are provided with protective devices designed to prevent damage from high-frequency currents. On the e.h.p., d.c. generator sets, spark-gaps having non-inductive resistances in series are connected across each generator armature; on other machines or feeders straight-filament lamps in cast-iron boxes are shunted across the machine terminals or feeder. In a few cases where the machine current is small a condenser of 2 μF capacity with lamps in series is used. A supply of current was required for providing aircraft obstruction lights on certain masts. As the masts are highly insulated from earth it was impracticable to take a supply directly from the mains. The difficulty was overcome by mounting a 2-kW, 240-volt, d.c. dynamo on the mast and driving it by means of a suitable 50-cycle squirrel-cage motor on the ground through the medium of a rubber motor-cycle belt. The motor is weather-proof and actuated by a Venner time switch.

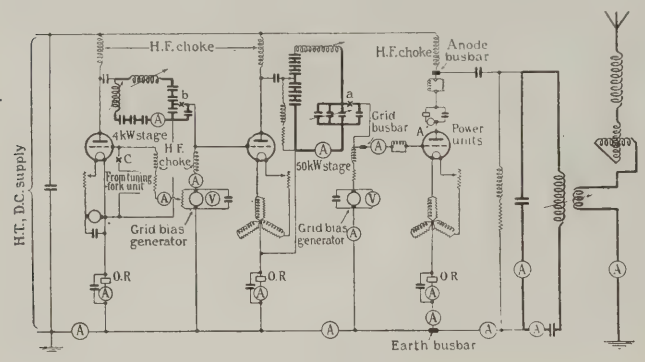

Fig. 7.—Transmitting Circuit.

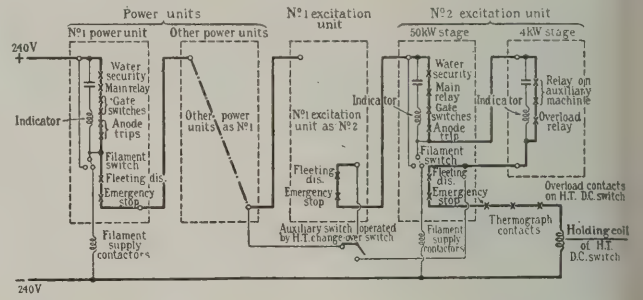

Fig. 8.—"Series" Control Circuit.

High-Frequency Generating Valve Plant.—The aerial was designed so that it could be used as one large aerial or be readily divided and two separate down-leads were provided so that it could be used for simultaneous transmissions when necessary. However, it was decided to carry out experiments in transatlantic telephony in association with the American Telegraph and Telephone Co., and the smaller part of the aerial has been reserved for this purpose for the present. The primary source or master oscillator is a valve-maintained tuning-fork having a frequency of about 1,800 cycles per second (adjustable within small limits), and the high-frequency required for controlling the main set is obtained by selecting the 9th harmonic of the tuning-fork frequency. The frequency produced by this means is remarkably constant, the variation with temperature of the tuning fork being about 1 cycle in 10,000 per deg. C. A small adjustable electric heater enables the temperature of the box containing the tuning-fork to be kept constant. The output from the fork is of the order of micro-watts and is amplified once at low frequency. The 9th harmonic is then selected, filtered, and amplified three times with low-voltage valves, giving a final output of 100 watts from the last of these three stages. The tuning fork and all the above stages of amplification are contained in two copper boxes mounted one above the other, the various stages being screened from each other by copper partitions (fig. 6).

The output from the tuning-fork unit is amplified three times before it is delivered to the aerial circuit, the various stages being designed to deal with input powers of the order of 4 kW, 50 kW, and 1,000 kW respectively and giving output powers of 2 kW, 30 kW and 540 kW respectively. The combination of the 4-kW stage and its associated 50-kW stage forms an "excitation unit," which with the tuning-fork units are provided in duplicate.

The final stage of amplification (*i.e.*, the power units) is not in complete duplicate. The practice of having a number of units capable of being worked in parallel on common busbars has been adopted.

High-pressure D.C. Supply.—The excitation units and the power units utilise the same high voltage d.c. supply, which is switched on to the 4-kW stage, the 50-kW stage and whichever power units are in use, by the pressing of a single button on the control table.

Fig. 7 shows the circuit arrangements from the output of the tuning-fork unit to the aerial; the tuned high-frequency circuits are indicated by the thick lines and a particular characteristic is the use of a single tuned circuit between one stage of amplification and the next, and the use made of capacitative coupling for giving the necessary voltage variations on both anodes and grids. Some of the advantages of such capacitative couplings are:—(1) A condenser provides a low-impedance path for the harmonics necessarily generated by a valve transmitter when it is operated as an efficient power amplifier, and thus acts as a desirable harmonic filter; (2) the actual voltage-swings are easily and accurately calculable, both for design and during adjustment; (3) the power factor of a good condenser being very low, the voltage and current are practically in quadrature.

Three busbars run the length of the installation for the anode, grid, and filament (earthed) respectively, and to bring a particular unit into operation in parallel with others it is only necessary to connect it to the busbars by one 3-way switch, and the filament switch.

The 4-kW stage utilises glass valves of the so-called 600-watt type—*i.e.*, capable of a dissipation of 600 watts—and the panel can be equipped with 1, 2 or 3 such valves. The 50-kW stage utilises three water-cooled valves similar to those in the power units, and the coils forming the inductances of the high-frequency circuits of both stages are constructed of cable of insulated and stranded wires, wound on a framework of American whitewood in a similar manner to the large inductances described later. The cable of the 4-kW stage inductance is 243/36 S.W.G. and that of the 50-kW stage is 729/36 S.W.G. The condensers of these high-frequency circuits are mica condensers in oil. Associated with each excitation unit is one motor driving four generators, utilised for the following purposes:—(1) 500/1,500 volts, $\frac{1}{2}$ amp.; anode supply for various amplification stages of tuning-fork unit; (2) 15/20 volts, 60 amps.; filament supply for 4-kW stage, and also for tuning-fork unit by means of potentiometer; (3) 40/600 volts, 12 amps.; grid-bias voltage for power units; (4) 200/600 volts, 1.5 amps.; grid-bias voltage for 50-kW stage and also for 4-kW stage by means of potentiometer.

With such a chain of amplifiers one probable difficulty is the self-oscillation of the system in whole or part due to retroaction from the later to the earlier stages, but this tendency can be reduced by screening between the various stages.

Power Unit.—When the design for Rugby was prepared, the largest power valve commercially available which had been subjected to severe traffic tests was the Western Electric water-cooled valve which is capable of dealing with an input of 20 kW, of giving an output of 10 kW, and continuously dissipating 10 kW when operated at a d.c. anode voltage of 10,000 volts, the filament consumption being 41 amperes at 22 volts. All the valves used in the installation were manufactured by the Western Electric Co. at New Southgate, England.

Fig. 9.—Main Condenser Banks in Intermediate Circuit.

An efficiency of the order of 95 per cent. can be expected from the coupled circuit to the antenna, which means that for an aerial power of 500 kW an output from the valves of about 520/530 kW is required. The determining factors in deciding the size and number of the power units were as follows:—(1) The number of valves in each unit should be preferably a multiple of 3 in order to permit the balancing of the filaments between the 3 phases; (2) the number of units must not be unduly large, in order to avoid complication of wiring and excessive duplication of meters, &c.; (3) the number of units should be sufficient to enable the number of valves in use to be varied in suitable steps (*a*) for the station to work on low power if this proves to be economically desirable, or (*b*) for the utilisation of a smaller number of greater power valves as the manufacturing technique of power valves develops; (4) the number of units should be suitable to provide two transmissions of the order of 300 kW aerial power and still leave a

spare unit. These considerations led to the decision to provide 5 power units, each capable of an output of 180 kW from 18 10-kW output water-cooled valves; 3 power units would be required for a 500-kW aerial power transmission, leaving two units spare; also two transmissions of over 300 kW aerial power could be undertaken by using two power units for each, leaving one unit as a spare in reserve. A power unit consisting of 18 valves is a rectangular enclosure with 9 valves on each side and the two anode panels are supported from the floor by 4 18-in. insulators that also supports the copper water pipes between these panels which not only act as headers for the water supply to the anodes, but also as the anode busbars for the valves in the panel. In the event of any particular valve taking an excess current due to softness or any other reason, the corresponding relay operates, releasing a hammer normally held up by the armature of the relay which in turn operates a mechanism which trips the high-pressure d.c. switch by breaking the "holding coil" circuit.

The distilled water is supplied through 30 ft. of 2-in. diam. rubber hose wound on a horizontal wooden drum at the bottom of the power units. The long length of water in the rubber hose provides the necessary insulation of the anodes from the earthed metal parts of the water cooling system, and the drum carrying this hose is a part of the insulated anode system. The short lengths of rubber tube from the headers to the valves provide the insulation required between valves to permit the insertion of relays, coils, &c., in the individual valve anode circuits. The insulation of the anode system of one power unit under working conditions with water flowing is of the order of 520,000 ohms, giving a leakage current through the water at 10,000 volts of only 20 mA.

The Paralleling of Valves.—One of the difficulties is the tendency of the valves to "self-oscillate," individually, or in groups, the inter-electrode capacity of adjoining valves, or groups of valves, forming the condenser of the oscillating circuit in association with the inductance of the connecting leads, &c. These difficulties are increased with water-cooled valves where the existence of the water jacket increases the inter-valve and inter-electrode capacities very considerably. The system is made stable by one or more of the following devices:—(1) The provision of a small condenser between the grid and filament of each valve, as close to the electrodes as possible, in order to make the grid-filament impedance capacitative. (2) The use of "stopper" circuits in the individual anode, and/or grid circuits, consisting of an inductance in parallel with a resistance high compared with the impedance of the inductance at the transmitted frequency. For undesired oscillations, however, which are of a much higher frequency, the added inductance becomes a large proportion of the inductance of the circuit and the resistance across it provides sufficient damping for the conditions of self-oscillation of the valves to be unfulfilled (Western Electric Co.). (3) The insertion of a series resistance in the individual anode or/and grid circuits which acts as a damping for self-oscillation, but is not of high enough value to cause a large power loss at the transmitted frequency.

The paralleling of the power units themselves also involves consideration as to the method of prevention of inter-oscillation between power units.

At Rugby the combined anode of the power unit is fed to the main anode busbar through a "stopper" circuit consisting of an inductance of 100 μH in parallel with a resistance of morganite plates of 8.5 ohms. The combined grid of the power unit is fed to the main grid busbar through a "stopper" circuit consisting of an inductance of 50 μH in parallel with a resistance of 300 ohms formed by 6 straight-filament lamps in series.

Safety Devices.—Safety devices for the protection of the staff are provided. The protection of plant is of special importance, because the closing of the h.p. switch for a very short period under incorrect conditions might result in the destruction of a number of valves, and there is a possibility of valve failures which amount to a short-circuit of the 10,000-volt d.c. supply. All the safety devices and relays are therefore linked in one series circuit through the "holding" coil of the high-pressure d.c. switch. A disconnection in any one place will prevent the switch from being closed, and also the breaking of the circuit at any point during transmission due to a fault or an overload will open the switch. Fig. 8 is a skeleton diagram showing the circuit arrangement of this "series" control wiring.

(*To be continued.*)

The Electricity (Supply) Bill, 1926.

Some Authoritative Constructive Criticism.

The following statement has been sent us by Mr. R. A. Chattock, president of the Institution of Electrical Engineers, and city electrical engineer, Birmingham:—

Since the Bill was published there has been a large amount of criticism from various points of view. Most of this has been destructive and will not, I think, help the Government to any great extent. It seems to me, therefore, desirable to try to put forward something constructive.

The Bill is designed to make the handling of electric current easier, to cheapen its production, and make it available throughout the country.

It is apparently the complaint of the Government that existing facilities have not done this, and that to this extent the present supply undertakings have failed. I think this complaint, if it is really justified, is due rather to the inefficient and hampering legislation in the past, than to the shortcomings of the undertakings.

There is no doubt that the existing machinery is cumbersome, and requires simplification. As an example, the Birmingham undertaking has waited for nine months for sanction to supply a rural district outside the Birmingham boundary. Doubtless other undertakings are hampered in the same way.

I feel that it is unfair to criticise the industry on this account. What is wanted is the provision of greater facilities to prevent these delays, and machinery to make easier and simpler the obtaining of wayleaves for overhead lines.

There is no indication in the Bill that the present hampering restrictions will be done away with. I am afraid that the establishment of the proposed Board will tend to make things still more difficult. It will, in fact, be the buffer between the industry and the Electricity Commissioners, and we can only anticipate a slowing-up of the present procedure when it is established.

The main duties of the proposed Board can apparently be divided into two sections:—

1. To control and cheapen the cost of generation.
2. To provide for main transmission throughout the country.

Considering the case of generation first, if we look at the large industrial centres which have already established highly efficient generating stations of large capacity, which stations would probably be "selected" by the new Board, it certainly does not appear that control of any such stations can materially affect the cost of producing electricity in them. It is only when we come to the large number of small generating stations throughout the country that improvement can be looked for.

If, therefore, the big stations in the industrial centres are allowed to develop on present lines, and if those undertakings are required to extend their stations, and, if necessary, build new ones in order to furnish a supply to very much larger areas, there does not seem to be any need to interfere with them so far as generation is concerned.

When we come to transmission, however, a different picture presents itself. The establishment of main transmission lines from the large industrial generating centres to the rural districts and the smaller towns in the country is work for which there is at present insufficient machinery set up.

Here is where a Central Board might do very valuable work. Powers could be given to it to purchase from the existing large centres what current it required for distribution, and to retail it in bulk to the distributing authorities outside those centres. Such current might be purchased at cost price and retailed at a price which would cover the cost of transmission and administration.

In this way the smaller undertakings would, in a very large number of cases, be placed in the position of obtaining their current at a cost cheaper than they could generate it at their own stations. When this happens it would be commercially sound for them to purchase what they require in bulk and eventually to close down their generating stations. Such procedure would not savour of coercion as is hinted at in the Bill.

This very process has been going on within the large industrial areas already. Birmingham has closed down four small generating stations, and it transmits current from its large generating stations to those centres from which it is distributed. This change has come gradually, and only when it has proved to be sound commercially.

It would be attractive to the large centres to sell current in this way, at cost price, as their turnover would be largely increased, and though their load factor would only be slightly improved, the fact of the larger turnover would really enable current to be produced more cheaply.

The stimulus of competition in low cost of production would also remain between different areas a most valuable asset. There would be no such incentive left under the scheme outlined in the Bill.

As regards the establishment of main interconnecting lines between large centres, I cannot see that the cost of this is justified. There will be sufficiently large generating stations in each area to justify coupling them up regionally, and the cost of doing this will be very much less than coupling up nationally. Ample spare plant to ensure reliability would be justified in each area amongst its own group of stations, and there should be no necessity whatever to draw current from other centres, perhaps a hundred miles away, at a much higher cost.

Development on these lines will render the standardisation of frequency unnecessary, while if current of standard frequency was required in an area which is at present non-standard, there would be no objection whatever to the installa-

tion of generating plant built for standard frequency in non-standard stations.

This plant would have the benefit of the high economy of the large station behind it, and any current produced by it would cost no more than the bulk of the current supplied from such a station.

There does not therefore appear to be any justification for an upheaval such as is proposed in the non-standard areas, at such a colossal cost as is indicated in the Bill.

I am convinced that the pooling of the load factors of different areas would make practically no improvement in the average load factor. I agree that this looks an attractive proposition, but it is, in my opinion, very questionable whether the diversity factor is really great enough to create any improvement.

The hours of employment in industry are practically identical in all areas, so that the power load would be demanded over identical periods each day. The habits of the residential population do not vary in different areas, their meal times, their hours of rising, and their times of retiring to rest are the same, and one cannot imagine that there would be any diversity here.

If an improvement in the average load factor is desired, I maintain that the railway system throughout the country should be electrified. If this were done, the load factor would be undoubtedly improved. The comparatively high load factor obtained on the North-East Coast is largely due to railway supply, whilst in America load factors of 40-45 per cent. are obtained, also due to railway electrification.

As regards week-end pooling of plant throughout the country, the large expenditure which would be required for the interconnecting lines would certainly not be justified by this. Regional week-end pooling in each area would provide all that is necessary for obtaining the highest economy of operation.

A very important consideration in connection with the proposed "Gridiron" is the danger of concentrating such an enormous capacity of plant on to one system. The tendency at the present time is to sectionalise the main system network more and more, partly to limit the effect of disturbances, and partly to enable the control switchgear to operate with certainty. Even at the present time the large size and capacity of the switches that have to be employed is increasing the cost of switchgear out of all proportion to the rest of the station.

I am convinced that we shall come to an arrangement in which each large generator will supply its own group of circuits, entirely distinct from any other. As the load falls off, generators will be paralleled, and the load transferred so as to keep those running on circuit properly loaded up.

In Birmingham, in order to provide the safeguards indicated above, the city has already been divided up into two sections, and further division is contemplated as the capacity increases. This has been found necessary on a system which at present has a total capacity of 140,000 kW.

In the Weir Report reference is made to the necessity for interconnection between areas, and in support of this (see Clause 25) Mr. S. Insull, President of the Commonwealth Edison Company of Chicago, stated in evidence that in his judgment any man who refuses interconnection (and he did not exclude England) does not understand the fundamental economies of the business.

I was very surprised to see this reference to Mr. Insull's evidence before the Weir Committee, because some two years ago several engineers, including Mr. Insull, Junior, from the Commonwealth Edison Company of Chicago, called on me in Birmingham and discussed a proposal to split up the high-tension system.

They informed me that they had suffered very serious interruptions due to disturbances which it was impossible to control owing to the enormous plant capacity that was grouped on to the interlinked system, and they were considering the question of sectionalising the system in order to limit the plant capacity of any one section.

Again, quite recently I received a communication from Mr. George A. Orrok, consulting engineer to the New York Edison Company, in which he stated that in the Hell Gate and Sherman Creek Stations in New York they are now isolating the large generators, each one being connected to a group of feeders in order to minimise the effect of disturbances that may occur.

Further, again, Mr. Alexander Dow, the President of the Detroit Edison Company, has published an article* in which he describes a method which he calls the "Loose Linking of Large Power Sources" in order to minimise system disturbances and reduce the duty on the circuit breakers without sacrificing flexibility and enonomy of operation. He states that continually increasing demands and generating capacity, together with the close knitting of the transmission system, forced them into adopting this method some years ago.

The service was becoming jeopardised by the amount of generating capacity behind the circuit breakers. The whole connected capacity was ever ready to spill an immense amount of energy into a fault whenever one developed. They could not allow conditions to continue that were favourable to system-wide disturbances. They have even applied this method to the two halves of one generating station.

Experience has shown that the tieing of sections together in this way does not require any greater reserve capacity of generating plant than in a system that is closely interconnected all the time.

In Mr. Dow's opinion, even if more reserve capacity were required, it is not so expensive to provide it by means of reserve generating plant capacity as by heavy tie lines between generating stations. In this way they have minimised the duty of circuit breakers, and consequently the possibility of failure and service interruption.

I therefore feel that a case has not been made out for pooling the generating resources in this country, but that very valuable results would be obtained by placing all main transmission lines and the purchase and sale of electricity passing through them in bulk in the hands of one, or possibly several, boards.

* See Elec. Rev., February 12th, 1926, page 269.—Eds.

British Plant in China.

Some Small Gas-Engine Electricity Generating Stations.

The British machinery market in China has held its own from the beginning. Numerous steam power plants for electricity supply have been installed in the provinces, ranging from the huge 20,000-kW Parsons and Metropolitan-Vickers turbo sets in the Shanghai Municipal Electricity Department, to the small home-lighting sets found in the small towns; yet the introduction of gas-engine plant is a recent event, dating back only a score of years. A typical installation of such a plant is that of the Kiangwan Electric Light Co., Ltd., Kiangsu, a description of which may prove of interest as the equipment is all British.

The town Kiangwan is only four miles north of Shanghai and is situated on the Shanghai-Woosung branch of the Shanghai-Nanking Railway, so that the transportation problem is not so difficult as is experienced in the interior. The company had three vertical hot-bulb oil engines of Continental make in the early stage of its development, but with the growth in the demand it was decided to increase the plant capacity by two 100-kW gas-engine sets. As an emergency measure to meet the demand pending the arrival of the machinery, the company obtained from local stock one "Mirrlees-Diesel" vertical, single-cylinder, open-type engine, 50 h.p., 250 r.p.m., to drive an International G.E.C. 40-kVA alternator, a small petrol engine compressor being used for charging the air bottles. The two gas-engine plants were erected during the summer of 1922, when one set arrived about a month prior to the second one, thus enabling the engineer to supervise their erection separately. The engines were manufactured by the National Gas Engine Co., Ltd., and are of the twin-cylinder horizontal type, each developing 150 b.h.p., at 210 r.p.m. They run on producer gas, suction-gas plant having been supplied by the makers of the engines; anthracite is used as fuel. Each gas engine belt drives a 127-kVA alternator, 3-phase, 50 periods, 2,400 V, 750 r.p.m., directly coupled to an exciter, manufactured by Messrs. Bruce Peebles & Co., Ltd.

The switchboard was supplied by Messrs. Whipp & Bourne, Ltd.; it is of the open type, consisting of four panels, excluding the feeder and exciter panels. The oil switches, made by Messrs. Erskine, Heap & Co., Ltd., are fitted with overload and no-volt trips. Synchronising equipment is provided, but the alternators are running on separate circuits and are therefore not required in parallel. Other electrical apparatus like distributing panels, transformers, and protective gears, are native made, but large quantities of cables and wires were supplied by Messrs. W. T. Henley's Telegraph Works Co., Ltd. The erection was carried out by native engineers and labourers under the supervision of Mr. R. A. E. Denton, of the British Electrical and Engineering Co. of China, Ltd., Shanghai, who supervised the Diesel-engine erection also. The plant has been running since it was first put down and the repair costs have been negligible.

A similar 127-kVA set is installed in the city of Tatung, on the Yangtse River in the Kiangsi Province, and another gas-engine installation is to be found in the works of the Yangchow Electric Light and Power Co., Ltd., Yangchow, Kiangsu Province. The latter consists of a direct-coupled vertical engine alternator set. The engine, also made by the National Gas Engine Co., Ltd., is of the six-cylinder, three-crank, tandem type developing 450 b.h.p. at 300 r.p.m., with anthracite suction gas-producer plant. The alternator is of Messrs. Mather & Platt's manufacture, and is rated at 300 kW, 0.8 power factor, 2,300 V, 50 periods, 3-phase. The switchgear was supplied by Messrs. Erskine, Heap & Co., Ltd. The set was installed by the Jardine Engineering Corporation, of Shanghai, in 1924, and has given every satisfaction.

At the present time crude-oil engines are more favourably considered in China than gas engines. British plant is still prominent on the market, though the prices are not very competitive with those of the Germans.

Swiss Electric Locomotives.—Work is in hand at the works of the Sécheron Co. at Geneva on the electrical equipment of four locomotives which, it is claimed, will be the most powerful in the world. The engines, which are intended for service on the Lotschberg mountain railway, are being provided with six 700-h.p. motors, and are intended for the haulage of trains for which two engines have hitherto been required. The locomotives have nine axles, and are 82 ft. in length.

Parliamentary News.

[By Our Special Parliamentary Reporters.]

The Guildford Corporation Bill.—The clauses in this Bill by which the Guildford Corporation seeks power to sell electrical fittings and wiring, and to open showrooms, were considered by Section A of the Local Legislation Committee of the House of Commons last week. As in the case of the Colwyn Bay and Doncaster Bills, there was opposition from the local contractors.

Mr. W. J. Jeeves, K.C. (who appeared with Mr. Rowand Harker, K.C., for the Corporation), said that the electricity undertaking at Guildford was acquired by agreement in 1921. Since the Corporation had acquired the undertaking the consumption of electricity had been more than doubled, and the price reduced by 32½ per cent In view of that record, he was confident that the Committee would agree that the Corporation could be trusted to conduct the undertaking in the best interests of the consumers. The erection of a new generating station was contemplated, because the present station was working almost to its full capacity, and the area of supply had been increased. The great majority of the houses in Guildford were of the small type, and the present position was that if the occupier of a house could not put down in a lump sum the price of his installation, he could only hire it and pay a rental for all time, and had no opportunity to buy it. The contractors in Guildford had done nothing to increase the consumption of electricity in the town. Their view, that the exercise by the Corporation of the powers asked for would drive them out of business, was an entire misconception, because the contractors would get more work than at present, as was shown by the results achieved in other towns.

Mr. W. E. Affleck (the electrical engineer to the Corporation) was the first witness. He was cross-examined by Mr. Craig Henderson, K.C. (who appeared with Mr. M. N. Drucquer for the contractors). Following a statement by the witness that one of the main reasons why he wanted selling powers was that he wished to develop electric cooking and sell cookers on the deferred-payment system, Counsel urged that the Corporation could develop electric cooking just as well by means of simple hire, under its existing powers, and suggested that in its present stage the electric cooker was liable to become obsolete at a not very distant date, so that the wise man would hire rather than purchase a cooker. Witness disagreed with this view, and said that there were a number of people in Guildford who were anxious to purchase electric cookers by the deferred-payment system. The large majority of contractors in Guildford were inefficient. If the Corporation had wiring and selling powers, it could carry out wiring as well as it could be carried out by the few first-class contractors there, and probably cheaper than one or two of them.

Discussion then turned upon the desirability or otherwise of the Corporation being bound to carry out wiring through the contractors. Witness objected to this, however, on the ground that the Corporation would have to finance the contractors, who stood to gain everything and to lose nothing. He said that his charge for wiring would be as near cost as possible. Counsel said that that would make it impossible for the contractors to compete. It was suggested by the Chairman that, in the event of wiring and selling powers being granted to the Corporation, it should exercise caution, and obtain quotations from contractors for the equipment of houses of various sizes before establishing its own wiring department. Witness was confident, however, that he could keep a staff of ten wiremen continuously employed for a good many years to come, and said that he would not recommend his Committee to establish a showroom and launch a big development campaign without the powers to wire and sell.

Mr. J. B. Rapkins (Mayor of Guildford, and chairman of the Electricity Committee) gave evidence, and attributed the increased consumption of electricity in Guildford mainly to the facts that the Corporation had improved the efficiency of the works and had decreased the price. He said that it was necessary that the wiring should be carried out by the Corporation rather than by the contractors under Corporation supervision. Counsel held, however, that it was merely a matter of preference; the contractors had no objection to supervision. As to the suggestion that the contractors had done nothing to help the development of electricity, Counsel said that the Corporation had not encouraged them to do so.

Mr. L. L. Robinson (Borough Electrical Engineer, Hackney) spoke of the results achieved in Hackney, where the Borough Council had possessed wiring and selling powers since 1906, and said that the exercise of those powers had been beneficial to contractors, the Borough Council and the consumers alike. As evidence that the exercise of those powers had not injuriously affected the contractors, he said that during the last year 296 installations had been executed by the Borough Council's workmen; 98 had been executed by contractors to the order of the Borough Council; 378 were executed directly for the consumers by local contractors; and 491 directly for the consumers by contractors whose business premises were outside the Borough Council's area. A very large number of those orders had originated from the canvassing work of the Borough Council. His experience was that most of the contractors were in a small way of business and could not do much canvassing; also, they did not put forward hire-purchase systems. He did not think many contractors charged less than cost plus 35 per cent. for installations, "cost" being labour and materials. It was suggested by Mr. Craig Henderson, in cross-examination, that the best work was done by contractors in Hackney on the basis of 20 per cent. on cost, this including overhead charges. Witness said that that was not his experience.

Mr. W. Finlay (secretary and solicitor to the Electrical Contractors' Association of Scotland) was the first witness on behalf of the opposition, and spoke of the excellent results accruing from the co-operation of the supply authorities and contractors in Glasgow and Edinburgh. He agreed that it was wiser to hire an electric cooker than to buy it at the present time, in view of the possibility of obsolescence, but added that the charge for energy for heating and cooking in Guildford to-day was 2½d. per kWh, at which price it was not a practical proposition. He had visited Guildford, and had found that at least three of the contractors there had up-to-date showrooms. Cross-examining Mr. Jeeves pointed out that the prices which were charged in Glasgow for installations were prices which were settled by the Glasgow Corporation and the contractors in consultation, and Glasgow was able to work such an arrangement because the Corporation had powers to execute the work itself. In Edinburgh, however, the Corporation had not those powers, and he suggested that that was the reason why there was no controlled schedule of prices there. Witness replied that there was no necessity for a controlled schedule of prices in Edinburgh, because the Corporation did not sell installations and had not yet started hiring them. It was put to the witness by Mr. Jeeves that there was no reason why the Guildford Corporation should not co-operate with the contractors if granted wiring and selling powers, but witness pointed to the statement of Mr. Affleck, that he proposed to charge a price for installation work which was as near cost as possible. The Chairman said that the only point at issue was that the wiring should be done through the contractors. He pointed out, however, that the Corporation had to find the money, and had to take the risk involved in maintenance, which was important. He asked why contractors should not guarantee the efficiency of installations or apparatus which they supplied during the period covered by the deferred payments. Witness replied that an apparatus or installation might fail in a short time owing to abuse by the user, but if it failed because the installation was bad in the first place, then it was the fault of the person who had inspected it on behalf of the Corporation.

Mr. T. E. Alger (president of the Electrical Contractors' Association) said that the Association did not object to hire purchase so long as the wiring was carried out by the contractors, and that the Association had no part in the control of prices.

Mr. W. J. Brown (of Messrs. Tiley & Brown, electrical contractors, Guildford) said there were eight *bona-fide* contractors in Guildford—and that was a conservative estimate—with permanent staffs numbering about 64. There were sufficient firms of standing to carry out the whole of the wiring required there. He welcomed supervision of his work by the Corporation. He agreed that his firm were also ironmongers and general engineers, and that electrical contracting constituted the smaller part of the business. He believed that none of the contractors in Guildford had offered publicly to wire houses on the hire-purchase system, and in his view it was not a commercial proposition.

Mr. Craig Henderson, in his summing up, urged the view that the question under discussion was one which should be settled by Public Act. The general law did not confer upon municipal electrical authorities the powers which were now asked for by the Guildford Corporation, and a special case had to be shown before the general law could be extended to them. No special circumstances had been put forward, however, with regard to Guildford, and it had been admitted by Mr. Affleck that there were electrical contractors there who were competent to carry out the necessary installation work, as well and as cheaply as he could do it. There was no case for the granting of selling powers, but, if they were granted, they should be limited to genuine hire-purchase.

Mr. Jeeves (for the Corporation) adopted the argument that Mr. Craig Henderson's remarks constituted a plea for the continuation of the middle-man, which must inevitably result in increasing the price to the consumer. But if the powers were granted, the middle-man would not be eliminated, and he would still have a chance to compete. It was unreasonable that the Corporation should go to the expense of providing a showroom and of canvassing, but should not be allowed to reap the benefit.

The Chairman, in announcing that the Committee had decided to grant the powers, said that the evidence had led it to the conclusion that the provision of electrical installations in small property by means of a system of deferred payments had been very successful. The Committee felt that the Corporation should "go slow" in this matter and seriously consider every move in the interests of the consumers. Where there were reputable wiring firms, upon whom it could rely to do good work at reasonable prices, it would do well to employ them and to seek their co-operation. Also, whatever staff the Corporation employed in the exercise of the powers should be fully occupied, in order to avoid waste and increased costs. The powers would also enable the Corporation to protect itself against high prices.

Mr. Jeeves intimated that the policy which the Committee had advocated would be the policy which would appeal to the Corporation, and Mr. Drucquer intimated that the contractors would do their best to co-operate loyally with the Corporation.

Trans-Atlantic Telephonic Communication.—On April 20th, Sir H. Brittain asked the Postmaster-General whether, following the recent successful trans-Atlantic telephonic communications, any further developments were taking place.

Sir W. Mitchell-Thomson said that he was not in a position to give the House any further information with regard to those tests at present. Experiments continued to be conducted with a view to solving the numerous technical difficulties involved in simultaneous two-way radio-telephone transmission where land telephone lines must be associated with the radio link at both the transmitting and receiving ends.

Bristol Corporation Scheme.—On April 20th, Colonel Woodcock asked the Minister of Transport whether it was the intention of the Electricity Commissioners to withhold permission to the Bristol Corporation to proceed with its power station at Portishead until such time as the Electricity (Supply) Bill had been placed upon the Statute Book.

Colonel Ashley said he understood that the Electricity Commissioners did not propose to come to a decision on the point until Parliament had considered the Bristol Corporation Bill, but it might not be necessary to defer the consideration of this matter as suggested.

Smoke Abatement.—In the House of Lords, on April 22nd, during the Committee stage of the Smoke Abatement Bill, Earl De La Warr moved the insertion of the following new clause:—"It shall be the duty of a local authority on submitting proposals for the provision of houses for the purposes of the Housing Acts, 1890 to 1924, to satisfy the Minister that suitable arrangements are to be made for heating and cooking as are calculated to prevent or reduce the emission of smoke."

Viscount Gage, resisting the amendment on behalf of the Government, said that the Minister of Health was opposed on principle both to placing restrictions on the discretion of local authorities, and to attempting to interfere with the ordinary domestic habits of the people, except where it could be clearly shown that such action was necessary. Very great progress had already been effected without compulsory measures in connection with housing schemes in the substitution of gas for coal for cooking. Numerous examples also existed where electricity had been installed as the lighting and cooking agent, and experiments with all-electric houses were being tried on a considerable scale by several local authorities.

Lord Newton said that new housing estates were being put up all over the country, and it would be a crime if when public money was spent on such places they should be allowed to defile the atmosphere with their old-fashioned methods of heating and cooking.

Lord Banbury held that both gas fires and electric heaters were very expensive, and to pass the clause would add to the cost of the new houses.

The new clause was rejected by 40 votes to 8.

Power-Station Engineers.—On April 26th, Mr. Hore-Belisha asked the Prime Minister, whether he had received a letter from the Executive Council of the Electrical Power Engineers' Association pointing out the hardship which accrued to power station engineers, in view of the operation of Admiralty Order C.E. 194/25, whereby, although their responsibilities remained the same, they had been reverted to the minimum of the scale for their grade, resulting in many cases in a financial loss of £50 a year plus the appropriate bonus; and whether it was proposed to remove the grievance brought about by the operation of this regulation.

Mr. Davidson said that the matter referred to had recently been under consideration and a favourable decision had now been reached. This fact had been communicated to the Electrical Power Engineers' Association.

The Budget.—The Chancellor of the Exchequer introduced his "Budget" for 1926-27 on April 26th. No proposals of a revolutionary nature affecting business were put forward, but the following will have a bearing on business:—The assessment of income tax on a three-years' average is to be abolished in favour of assessment in respect of the preceding year, commencing in 1927; it is not proposed to renew the Trades Facilities Act next year; the import duty on arc lamp carbons is to be raised to 1s. per lb.; and the Key Industry Duty is to be extended, until 1936, to cover component parts of scientific instruments and amorphous carbon electrodes, not including primary battery or arc lamp carbons, at a rate of 33⅓ per cent. *ad valorem*. The tax on electric vehicles is to remain unchanged at £6 per annum.

Legal.

Cable Engineer Sent to Prison.

At Garstang Police Court, on April 22nd, Gerald S. Race, of Knott End, was charged with stealing £63 belonging to the Pirelli-General Cable Co., Ltd., of Southampton, which recently carried out a contract in the Preesall district. It was stated that prisoner took up the position of chief engineer in January last, and he had control of the work. Each week he had to send the firm a requisition for wages, &c., and received the necessary cheque. From January 1st to March 26th he requisitioned £1,235, and he disbursed £1,197, leaving a balance in hand. The company also sent him during the same period £25 for insurance stamps. The cards, however, had not been stamped and prisoner was subsequently arrested in Ireland. Mr. T. W. Busby, assistant contract manager to the company, said that prisoner's wages were £5 10s. per week.

Prisoner was also charged with obtaining money by false pretences from A. Parkinson, taxi proprietor, Knott End. The allegation was that prisoner ran up a bill of £7 for taxi fares, and also obtained £7 from Mr. Parkinson. He made out a cheque for £14, but this was dishonoured by the bank.

Prisoner said if the Court would give him another chance to make good, he would take advantage of it. He was sent to prison for one month, in the second division.

Claim for a Dynamo.

At Burnley County Court, on April 22nd, Messrs. George Mitchell & Co., electrical engineers, Burnley, sued W. Eccles, junr., electrical power and lighting engineer, Blackburn, for £43 10s. Plaintiffs claimed that they had supplied a second-hand dynamo to the following specification: 220 V, 800 r.p.m., and from 9 to 10 kW.

Defendant alleged that the machine was not up to its reputed capacity, and that the insulation was defective at the time of delivery.

The Judge found for defendant, stating that the plaintiffs had not carried out tests to support their claim that the dynamo was of the character claimed for it.

Richmond E.L. & P. Co.'s Pension Fund.

Mr. Justice Romer, in the Chancery Division on April 20th, heard a petition for the alteration of the objects in the memorandum and articles of association of the Richmond (Surrey) Electric Light & Power Co., Ltd.

Mr. Uthwatt, for the company, said the object was to give the company power to set up a pension fund for its employés.

His Lordship said he did not like the unrestricted power given in the proposed alteration under the head of "charitable objects." He thought it should be limited to objects directly or indirectly for the benefit of the company. With this amendment he confirmed the petition.

A Bankruptcy Offence.

After a trial lasting two days, the hearing was concluded at the Central Criminal Court, on April 23rd, of the case against William Henry Pease (39), an engineer, of Abbey House, Victoria Street, S.W.1, who surrendered to his bail and pleaded "not guilty" to an indictment which charged him with obtaining credit without disclosing the fact that he was an undischarged bankrupt. He was found guilty, and the Judge passed sentence of three months' imprisonment in the second division.

Correspondence.

Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The Heating of Buried Cables—Report No. 2.

There would appear to be a serious slip in the formula published in the above report relating to the temperature rise in three-core cables, and as the report itself is such an invaluable document and basis of reference, and I cannot find any corrections publicly attached to the report, it seems to be in the interest of the electrical profession, more particularly of those engineers, who, like myself, are not connected with cable manufacturing firms, that the correction should, as early as possible, be given sufficient publicity to save others from having to repeat the investigation which I have had to do to discover the source of the error. (Of course I know that in the case of the big cable manufacturing firms, who have had representatives on the Standardising Committee, the information conveyed in his letter has no doubt been imparted verbally to their staffs.)

Put very briefly, the trouble is as follows:—

The value of the resistivity "K," if calculated from equation (25) on page 534 of the *Journal* of the Institution of Electrical Engineers for May, 1923, will give results which are 300 per cent. too high.

If, then, one were to put this value obtained for "K" into equation No. 33 in order to obtain the value for "S" (the thermal resistance per unit length), one again gets results 300 per cent. too high.

The same remark applies more or less to equations 15, 18, 26, 29, 42, 44, 48 and 52.

Again, in equation (58), in the first term of the denominator, a symbol (r_a) is given, which would appear to be the resistance of one of the cores of the cable, but which is stated on page 566 to be the "inner radius of the containing tube."

Also equation (37) contains a printer's error. Finally, it may be mentioned that the definition of (H) as given at the top of page 521, is involved in equation (25).

The writer may say that equation (25) is correctly given in Report No. 1 (see page 196 of the *Journal* of the I.E.E. for February, 1921), and he has had occasion several times to use the formulæ give on this page and therefore did not notice until quite recently the discrepancy between this formula and that given in Report No. 2.

What is, however, common knowledge to those who are daily getting out thermal resistances of cables is not necessarily the same thing to those who have only occasionally to use such formulæ, and naturally would refer to a report like the one quoted as the last word on the subject.

I fully appreciate the immense labour which must have been entailed in putting together all the information in the report and checking it while it was yet in the manuscript form, but I cannot understand why no "errata" slip was attached

to the report to prevent the uninitiated from falling into the trap.

I feel that an apology is due to Mr. Melsom for publishing this information without first consulting him, but as he is over in America and as it seems of importance, as early as possible, to take steps which will save others from wasting precious time in trying to reconcile these formulæ, I hope he will excuse the irregularity.

No one appreciates more than I do the colossal nature of the work which he has carried through, and it is with the greatest diffidence that I make the suggestion of inaccuracy in equation (25) conveyed in the present letter.

A. M. Taylor,
Major S.O.2.

Birmingham, *April 20th*, 1926.

Electricity Supply Data.

I have read with interest your article on the above subject in the issue of April 16th, but venture to suggest that the *Electrical World* is not an authority of sufficient infallibility to permit the conclusions you derive from examination of its data. I find, for example, that the statistics of output of electricity as given by it differ materially from those published by the U.S. Geological Survey. The following table illustrates the position fairly clearly.

The Production of Electricity in U.S.A.
(Millions of Units).

Year.	Electrical World.	U.S. Geological Survey.	Difference.
1924 ...	54,413	59,013	4,600
1925 ...	59,517	65,408	5,891

The difference in the two sets of figures is sufficient, I think, to weaken some part of the case you put forward in your article. The only true comparison lies in the output of electricity from all undertakings in Britain as given in the fuel consumption returns of the Electricity Commission and the output as given by the U.S. Geological Survey.

For the year April 1st, 1924-March 31st, 1925, the British figures are 7,415 million units and the U.S. figures 60,371 million units, equivalent respectively to 175 units and 525 units (working on 42.5 million population in Britain and 115 million in U.S.A.). The American output is, therefore, three times the British per head of population.

I would venture also to question the percentage of units sold to units generated used in calculating consumption in the United States, namely, 81 per cent. In view of the fact that the British figure is 83 per cent., it seems very low. I find it also difficult to believe that "the central-station industrial field as it exists to-day is only 37 per cent. developed" in the United States, when the article states that American industry is 65 per cent. electrified, and that the output from private industrial plant aggregates 12,000 million units. According to the *Electrical World*, the total energy sold by central stations for power purposes in 1925 amounted to 27,867 million units. Assuming that 85 per cent. of this went into industrial consumption, the total would be 23,700 million units. The total capacity of power plant used in manufacture in the U.S.A. was, in 1924, 24,600,000 kilowatts and 37 per cent. of this would be 9,100,000 kilowatts. We are led to believe, therefore, that the total of 23,700 million units was consumed by 9,100,000 kilowatts or 2,600 units per kilowatt. The actual figure as calculated from the statistics given on page 45 is 1,600 units per kilowatt. The discrepancy between those figures requires explanation before we can believe that the central station industrial field is only 37 per cent. developed in the United States.

According to the U.S. Geological Survey, the increase in the output of electricity between 1920 and 1925 was 51 per cent., while the ratio of waterpower to the total output fell from 37.5 per cent. in 1919 to 34 per cent. in 1925, and will probably continue to decline. The comparisons given in the first paragraph of your article, in addition to being very much in the nature of special pleading in favour of this country, suffer from the fact that the 6,000 light and power systems mentioned for the U.S.A. do not represent 6,000 different administrations and cannot be compared with the 595 undertakings in Britain. Until we know the degree of amalgamation and centralisation of administration existing in the United States and in Britain, such a comparison is scarcely justifiable. In addition to this, the 584 stations listed for Britain include stations owned by non-statutory undertakings.

Hugh Quigley.

London, *April 19th*, 1926.

[We refer to this subject in our leading columns.—Eds. Elec. Rev.]

Three-phase, Four-wire Distribution.

In reply to "Inquirer's" queries in your current issue, I would advise him that there is no marked variation of pressure on a three-phase, four-wire supply when a three-phase star/star-connected, core-type transformer supplies unbalanced loads from each line to neutral, provided the unbalancing is not too great. The total out-of-balance current may be as high as approximately 20 per cent. of the normal full-load current without the phase pressures dropping by more than 2 per cent. Three-phase groups of single-phase transformers should, however, on no account be star/star connected for supplying three-phase, four-wire unbalanced loads.

It is certainly possible to operate a star/star-connected, three-phase, core-type transformer to supply a single-phase load should one of the transformer windings become defective, but on the other hand, transformer failures represent so small a percentage of the total number of transformers installed, that, in my opinion, this advantage should not be given undue prominence. If the unbalanced load is likely to exceed 20 per cent. of the normal full load of the transformer, it would be better to install delta/star-connected, three-phase, core-type units, and in practice probably 90 per cent. of the number of transformers installed are so connected. "Inquirer" will find fuller information concerning the points he has raised in the "J. & P. Transformer Book."

S. Austen Stigant,
Manager, Transformer Dept.,
Johnson & Phillips, Ltd.

London, *April 26th*, 1926.

Electric Vacuum Cleaners.

I appreciate Mr. Sacré's kind comments on what he is good enough to call the usefulness of my article on "Electric Vacuum Cleaners," while I do not agree with all his contentions. However, I agree strongly that salesmen do harm to their industry when they disparage competitive types of machine.

I agree that a very high-speed rotating brush probably damages a carpet as much as an excessive suction. However, I do not think a fixed brush in front of the suction orifice can be as effective as a rotary brush. It appears to me that the fixed brush must drive the dust straight up in the air in front of the machine and out of reach of the suction. Surely, the main purpose of combining brush and suction is to loosen the dirt and then suck it up.

For this reason I feel that the ideal machine is one that incorporates adequately powerful suction and a low-speed brush which does not damage the carpet any more than a fixed brush does, and operates more efficiently. The type of machine I am considering is the Standard (Western Electric), Premier Duplex, Hamilton Beach and Hoover, although I think the last mentioned has too small a suction and too high a brush speed. The secret of efficient design is to provide a high gear ratio between motor (*i.e.*, fan) speed and brush speed, so that the fan secures powerful suction and the brush rotates comparatively slowly.

As to the advantage of being able to fix on a stiff brush when required, this does not compare favourably with the most cleverly designed machine I know, which, besides having a geared, low-speed brush, has a switch for cutting the brush out of action when it is not required and the extension tools are being used.

My flour test is, as Mr. Sacré infers, a "sticky" one, both literally and metaphorically, but this is a severe test to bring out the abilities of only the best machines.

I disagree with Mr. Sacré's assertion that the "bag" type of machine is unhealthy or that it lets dirt get back into the room. I have never known this occur, and he must have run across a cheap machine with a badly made bag. Since reading his reply, I have made a careful test on two different types of machine, running them both over dirty carpets, and at the same time applying moistened, white, blotting paper all over the outside of the inflated bags for some time. The bags were found to contain considerable dirt, but the damp blotting paper showed not the slightest trace of dust or dirt. I think this test proves conclusively that a properly made bag is perfectly dust-tight and healthy. But even if the bag is placed in a cylinder, as Mr. Sacré prefers, surely air must come out of the bag in the cylinder just as out of a bag anywhere else, to allow a proper suction to be maintained. The bag is still the deciding factor.

Since no dust gets back into the room, I do not see the value of a disinfecting pad applied to dust-free air.

Replying to Mr. Sacré's question about adequate suction, I consider that a manometer should register between 14 and 16 inches on a properly designed machine at the fan chamber opening, with the bag on and the brush rotating. A new machine which has not been "run in" and is a bit stiff should never reach less than 12 inches.

A. G. Harrison Dent.

London, *April 26th*, 1926.

I have read with interest Mr. H. Harrison Dent's article in your issue of April 16th, and it is quite clear that he looks upon a vacuum "sweeper," as he calls it, as an article largely for carpet cleaning; but why cleaning should be so confined to carpets it is difficult to follow. Upholstered furniture, curtains, &c., all absorb dust and require almost as much cleaning as a carpet, and the demand is growing for an outfit with an all-round cleaning capacity, more mobile and easier to use than the ordinary vacuum sweeper.

Admittedly the vacuum sweeper has attachments for general cleaning purposes, but as Mr. Dent points out, suction is of special importance when using these attachments, and as the brush type of carpet sweeper (the type Mr. Dent seems to prefer) generally has a comparatively low suction, these attachments are of little or no value and are seldom, if ever, used.

The main point a user has to decide is whether a "carpet sweeper" is required or an all-round cleaning outfit, and it will be found that with the education the householder is receiving on this subject the all-round machine is preferred. The development of the enclosed-bag-type cleaner on wheels or

sleigh with its easy work and wide range of use has been brought about by the increasing demand.

Mr. Dent states that in his view a vacuum cleaner with a revolving brush is best for cleaning carpets. It therefore seems clear to me that Mr. Dent has not had the same amount of experience with the more modern types of domestic cleaning outfits fitted with the enclosed bag. These are suction-type machines, and have no mechanical devices to assist in the cleaning process, and I have had it proved to me many times that this type of suction machine will clean carpets quite as well as the other type referred to. The great popularity which the enclosed-bag-type suction machine has attained, testifies to the satisfactory character of the service it gives.

H. F. Simon, A.M.I.E.E.

London, *April 23rd*, 1926.

Overhead Transmission Lines.

I am sure interested readers of the Electrical Review will greatly appreciate Mr. Nelson's letter in last week's issue. I have myself found this gentleman's words true as regards rusty ironwork and bolts on pole fittings. While rustless steel or iron channel arms would certainly solve the main problem, may I make a further suggestion regarding bolts, insulator pins, bracings, and stay threads? If, when a transmission line is first erected, all such fittings mentioned above are coated with a solution composed of tar, tallow, and pitch carefully mixed together and applied with a brush, it will be found that the threads are rustless at all times. The tar itself acts as a waterproof liquid for mixing purposes, while tallow acts as grease on the threads, and pitch has always been used for warding off dampness from electrical fittings. May I say as a linesman with erection and maintenance experience that I have found the above method quite satisfactory and used to-day by some of our best mains contractors. I hope to read further suggestions that might greatly help in future developments in this particular section.

M. Simpson.

Leamington Spa, *April 26th*, 1926.

Trade-Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from April 21st :—

Magnet and Wire (design only). No. 465,650. All goods in Class 5. No. 465,651. Class 6. Machinery of all kinds. No. 465,652. Class 8. Instruments and apparatus for radio-telephony. No. 465,653. Class 13. Incandescent lamps (ordinary). No. 465,654. Class 15. Shades, globes, and reflectors made of glass. No. 465,655. Class 16. Electric insulating materials made of earthenware and porcelain. No. 465,656. Class 18. Electric alarms, signals, &c., as systems in buildings. No. 134,559. Class 25. Cotton-covered wire. No. 465,657. Class 32. Silk-covered wire. No. 465,658. Class 40. India-rubber-covered wire. Magnet No. 465,642. Class 6. Machinery of all kinds. No. 465,643. Class 8. Instruments and apparatus for use in radio-telephony and not consisting of or containing magnets. Correction.—One of the notices appearing in our last issue referred to the Magnet Engineering Co., Birmingham. This firm is at Liverpool. Application No. 444,263 is in respect of "electric switches (not containing a magnet)."

A New Electric Signalling Installation.—According to the *Electrical World*, a stretch of 226 miles of double track on the Union Pacific Railroad from Cheyenne, Wyo., to North Platte, Neb., has been equipped with a new inductive type of signalling equipment, which is considered a marked improvement over the complete block system. A total of 131 locomotives have been equipped to operate in conjunction with the new system, the locomotive equipment including a 32/350-V, d.c. motor generator, the current of which is cut down and changed by amplifiers. A transmission line parallel with the track is employed, and energy is transmitted at 2,300 V, a.c., from the plant of the Cheyenne Light, Fuel & Power Company and the central stations at Kimball, Sidney and North Platte, Neb. Two sets of transformers are employed, the first reducing the pressure to 110 V and the other to 1½ and 3½ V at the rails. The combination of the track current with the current generated on the locomotive operates the control lights in the engine cab—green for "clear" and red for "slow down." When the green is showing, the engine progresses at schedule speed; when red shows, it indicates a train or car on the track in the block ahead. A limited time is permitted for the reduction of speed to 20 miles an hour, and if this is not accomplished by the engineer, an automatic application of air to the brakes will result. Since the new system was first started eight months ago more than 11,000 engine movements have been recorded in the division mentioned without any difficulties being experienced. The equipment was manufactured by the Union Switch & Signal Company and is of the two-speed continuous inductive type.

Published Specifications.

Compiled expressly for this journal by Patent Agents.

The name of the applicant's patent agent, if any, will be found on the printed specification.

The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

The Progress of the Bill.

DURING the two days' consideration allotted to the Electricity (Supply) Bill by Standing Committee C of the House of Commons, last week, important changes in the constitution of the new authority were adopted, in principle, which will go far to remove the objectionable features of the original proposals under this head. As we pointed out in our issue of March 26th, a Central Electricity Board which would act as a mere appendage to the Electricity Commission would not serve the purpose for which it was created—namely, to co-ordinate and control the generation of electricity throughout the country. It was necessary, we said, that there should be but one controlling authority—the Central Board—and that the Electricity Commissioners should either become an advisory body to the Board, or be incorporated with it. The latter course, which we favoured, was put forward by the Labour party in Committee, but was rejected on the ground that it was a short-cut to nationalisation of the industry; the alternative, however, was adopted, and the Bill will provide the Board with full executive authority, whilst the Electricity Commissioners will prepare the technical schemes and submit them to the Board for approval. This seems to be a satisfactory solution of a very contentious problem, and the Government has been well advised in adopting it at so early a stage. It is understood that after considering and publishing a scheme put before it by the Electricity Commissioners, the Board will hold an inquiry if necessary; and that an independent tribunal will be set up, not by the Minister of Transport, but perhaps by the Lord Chancellor or some other authority, to hear appeals from the decisions of the Board.

With these proposals the opponents of the Bill have expressed their content. There are, however, many other controversial features in the Bill, and the list of amendments to be considered by the Committee is a long one, comprising some 220 handed in up to April 29th; many of these are of course either consequential or mutually exclusive. Some are designed to prevent injustice to existing power companies; others, to strengthen the obligation laid upon the Central Board

to delegate its functions where possible to joint electricity authorities and other existing authorised undertakers; others, again, to provide the right of appeal against the decisions of the Board or the Electricity Commissioners, the Railway and Canal Commission being usually named as the arbitrator.

An interesting suggestion is made in connection with Clause 14, which enables the Electricity Commissioners to put pressure on an authorised undertaker to take a supply of electricity in bulk owing to its being available from the Board at a lower price than the local power station's working costs—namely, that regard shall be had to any reduction of costs which might reasonably have been anticipated from improvements of the plant then in contemplation; it is often urged that much lower costs could be attained in small stations if the Commissioners would allow them to be extended by the addition of modern plant. A further suggestion in this connection is an entirely new clause, giving power to close any uneconomical station after three years from the date of the Act, but specifying that in comparing the cost of bulk supply and local generation the latter shall not be loaded with the capital charges in respect of the generating station; this is but reasonable, for otherwise the cost to the consumers would be increased by the change-over.

Another proposed new clause is of great importance, and will, we hope, be added to the Bill; it provides that everyone owning a generating station shall furnish to the Electricity Commissioners statistics relating to its operation. As we have pointed out, the Commissioners at present have no certain knowledge, and have no means of obtaining such knowledge, with regard to the capacity and output of private generating stations, so that no trustworthy comparison can be made between the actual consumption of electricity for all purposes in this country, and that recorded in respect of foreign countries. This is a very regrettable circumstance, and it is important that provision shall be made to deal with it, for other reasons besides that above-mentioned.

Again, a clause is put forward which will confer upon local authorities full powers to supply and fix electrical installations, including fittings, motors, &c., on the premises of their consumers, the only remaining restrictions being that they shall not manufacture any of the material, and that they must carry on the work without financial loss.

We regret to observe, however, that the omissions to which we have called attention have not been dealt with by proposed amendments; apart from a derisory clause relating to the lopping of trees, there is not a word about wayleaves and other facilities so urgently necessary—indeed, almost indispensable—to the rapid extension of electricity supply into the rural areas. Seeing that the rural consumption is one of the main factors relied upon by the promoters of the Bill for the cheapening of electrical energy all round, is it not extraordinary that no provision is made to facilitate that development?

Women and Electrical Progress.

ONE of the most promising movements that is in progress in the electrical world at this moment—at any rate so far as this country is concerned—is the attraction to our ranks of women of a suitable personality and character for helping forward domestic electrical enterprise. If they will excuse the use of such a term, the women who are to afford the right "material" for this branch of development will require to have reached a certain standard of educational fitness and must give evidence of zeal and enthusiasm which will assure a maintained interest in the study of certain aspects of electricity supply work and in the pursuit of knowledge respecting the apparatus which is demonstrated, displayed and sold in showrooms for the use of consumers in the home. Our readers are not unfamiliar with the organised efforts that have been made to bring electrical women together for their mutual advantage and therefore for the good of the industry. There are classes of work in the domestic electrical department which women, and women alone, can do with full effectiveness, as we have shown on several occasions, and the mere men who are running the industry and take a large view of the scope for future electrical development are ready to encourage their co-operation. But nobody will lose sight of the fact that on attractiveness and personality alone they will not succeed in giving that quality of service which so specialised an industry demands. There is no need for personal charms to be sacrified in order to secure business efficiency. The study need not be laborious, indeed it can be made most pleasurable, and the Electric Lamp Manufacturers' Association has discovered how to secure such a result by the arrangement of its first Home Lighting Course for Women, which was held with such success in London last week, and is referred to on a later page of this issue. From our own personal observation we are in a position to congratulate all concerned in this experimental effort upon its complete success, which we believe points the way for other conventions of a similar nature at which women shall be familiarised with the details and operation of other special classes of domestic apparatus, including cooking appliances, electric fires, vacuum cleaners, and so forth. What the Lighting Service Bureau has done through its manager, Mr. W. E. Bush, and the staff will assuredly spread the gospel of more efficient illumination and the advantages that accrue therefrom in the domestic circle, but such educational work is essential in respect of the other appliances mentioned, both for women and for men connected with the showrooms that are springing up in all parts of the country.

The E.T.B.I.

FAMILIAR objects in our daily routine attract little attention, no matter how great their importance; but now and again something occurs to bring them into sharp focus, and we realise their significance, almost with a sense of contrition. Thus it is with the Electrical Trades Benevolent Institution; its annual Festival Dinner brings it into the foreground in the autumn, and its annual general meeting in the spring—the rest is silence, though we know its beneficent work is being efficiently carried on throughout the year by its untiring hon. secretary, Mr. F. B. O. Hawes, and a few members of the Committee.

But we ought not to think of it only two or three times a year; it is one of those things which ought never to be far from the top of the agenda. What can we all do to help? The answer is easy—give it publicity. That can be done most effectively in two ways—by forming a local Committee, and by telling one's friends, employés, and colleagues what it is and what it does.

The splendid work accomplished by the Local Advisory Committees already existing in Cardiff, Manchester, Newcastle-on-Tyne, and Glasgow, explains the earnest desire of the Committee of Management that more of them should be formed. The fact that 81 grants were made last year, no qualified applicant being turned away, proves the need for the Institution as well as the necessity of supporting it, and the best possible form of support is that of subscribing membership. We trust that all our readers will personally endeavour to make the E.T.B.I. more widely known, even if they have no other connection with it—that costs nothing, but is worth much—and we warmly commend it and its work to the whole industry as well worthy of encouragement and support.

Electricity Meters.

IN *The Times* of April 23rd appeared a letter from a consumer at Notting Hill Gate, in which he said that, believing he had not consumed the electricity he was charged for, he had his meters tested, with the result that the lighting meter was found to over-register by 4½ per cent. and the power meter by 5¼ per cent. (Incidentally, too, he gave the test result of his gas meter, which was 16.28 per cent. fast!) We refer to this case not because we think that there are many cases of consumers having meters over-registering, but the reverse. The tendency, so far as the mechanical parts of a meter are concerned, is that the meter goes slow with length of time in service. Moreover, not only is there a tendency for meters to slow down on ordinary load, but also for meters not to start on one or two lights. The only places where the metering can be really accurate are where the undertaking has an efficient meter department, and where meters are left out on circuit for only a limited period; also where the meter readers have instructions to test the meters for starting, which can be done in a minute by turning on a light. It is perhaps in the smaller undertakings that meters are put in and remain for years, probably even till something goes flagrantly wrong. This is the more important since the smaller undertakings depend largely on a small sale of high-priced units, and units lost at 5d. or 6d. easily mount up to a considerable sum. Some undertakings invoice to consumers only about 75 per cent. of their output—some even less; losses in mains, &c., are, of course, included in the unmetered percentage, but there is every reason to think that this big margin of "lost" units might be materially reduced by a reorganisation of the metering arrangements of the undertakings.

Elsewhere in this issue we give some particulars concerning the meter-testing laboratory of the North Metropolitan Electric Power Supply Co. This rather suggests that the ideal to aim at, in order to obtain efficiency in dealing with large quantities of meters, is elaborate organisation rather than apparatus.

Tramways in 1924-25.

IN this issue we review the latest return relating to tramways and light railways (including railless traction systems) published by the Ministry of Transport, covering the year 1924-25. From the return it will be gathered that this "obsolete" system of transport is still doing a fair amount of business, having carried 4,620 million passengers during the period covered, about 177 millions more than in the preceding year.

The financial position, unfortunately, did not show an improvement. The ratio of working expenses to receipts rose from 77.74 to 79.10 per cent. (it was only 64.51 per cent. before the war), and the net receipts declined from 4.33d. to 3.80d. per car-mile. The total amount received from the rates was £521,801, while the undertakings contributed £281,732 to the rates, making a balance of £240,069 on the wrong side. Against this a sum of £52,803 was carried forward by the local authority undertakings after, in the aggregate, meeting all charges. It is necessary to bear in mind that these undertakings are not primarily profit-making concerns, and are designed to work to meet their expenses as closely as possible. The most interesting part of the return is probably that which classifies the municipal undertakings according to their financial results. Taking the numbers alone the position seems to indicate improvement, but in the aggregate there was a deficit of £282,907, as compared with a credit balance of £74,154 in 1923-24. One more undertaking was able to cover all charges, and show a balance, making a total of 99 out of 156 systems, while the undertakings which were unable to cover their working expenses were reduced from 11 to 8. In 1921-22 only 81 undertakings, out of 157, were able to cover all charges, while 14 failed to meet their working expenses. In that year, too, there was an aggregate deficit of £254,982.

Another point which should be considered when studying the return is the enormous influence of the L.C.C. result upon the whole. In 1924-25 the L.C.C. tramways received £237,836 from the rates, whereas in the preceding year they earned a substantial profit.

While the figures given in the return are not as satisfactory as they ought to be, we fail to discern in them any reason for making a clean sweep of tramways, quite apart from the question which would arise when arrangements had to be made to redeem the capital invested in tramway systems, which amounted to about 100 millions at the close of the period covered by the return.

On the other hand, we think that there is a case for a certain measure of protection against unlimited and irresponsible motor-omnibus competition in towns where an efficient tramway system has been built up.

The Problem of School Lighting.

THE discussion on school lighting, opened by Dr. James Kerr at the meeting of the Illuminating Engineering Society on April 29th, was attended by many representatives of the medical and scholastic professions. Dr. Nash, who presided, is himself chairman of a committee of the Medical Officers of Schools Association which is now studying the subject; and of those who joined in the dicussion several were themselves on the staff of technical institutions and able to speak from the teacher's standpoint. Dr. Kerr's paper gives the impression that the original report of the joint committee of the Illuminating Engineering Society, which has influenced the methods of leading educational authorities considerably, still contains in substance what is necessary for adequate school lighting. Only on two points were modifications suggested: an increase in the illumination to 5-7 foot-candles, and a limitation of the brightness of lighting units to 3 candles per sq. in. when located within the direct range of vision. These requirements can be easily met with modern fittings, of which examples were shown at the meeting. Further discussion between experts would probably not add greatly to our knowledge of the essentials of school lighting. What is needed is to bring the correct methods before the notice of educational authorities and medical officers of health. From this point of view the meeting served its purpose well. Good lighting received the endorsement of Mr. J. B. Lawford, one of the most eminent ophthalmologists in this country. Representatives of educational bodies, whilst explaining their own difficulties, showed themselves in complete accord. The practical need, very clearly put by Dr. Nash in winding up the discussion, is to induce authorities to meet the cost of proper methods, and the Society, in creating an atmosphere sympathetic to the claims of good illumination, is doing good work.

The General Strike.

As we are preparing these pages for the press, a "general strike" throughout the country has begun which embraces within its scope certain Trade Unions associated with the printing trades; almost inevitably, therefore, for the first time in its career of more than half a century, this journal will be prevented from appearing at the normal time. We trust that our readers will absolve us from reproach on account of this lapse, seeing that it is not in our power to avert it.

With regard to the strike itself, we can only say that we look upon it as a national misfortune of the first magnitude, which will have the gravest consequences; it is the more to be regretted in view of the fact that trade was distinctly reviving, unemployment was decreasing, and the prospects were brighter than they had been for years. That a speedy solution may be found for the nation's difficulties will be the earnest hope of every patriotic citizen.

Trolley Omnibuses at Ipswich.

The Corporation Fleet made by Messrs. Ransomes, Sims & Jefferies, Ltd.

THE Ipswich electric tramways were opened in November, 1903. The system comprises a little over eleven miles of route, only a portion of which is double tracked, the actual length of single line being a little over fifteen miles.

About three years ago the Corporation was faced with the necessity of either relaying practically the whole of the permanent way, or adopting some other method of public passenger transport in the town. While the tramway system had never been really remunerative, it would be still less so when burdened with the heavy expenditure which the relaying of the track would entail. Accordingly, on the score of economy in operating cost, it was decided to substitute railless electric trolley 'buses.

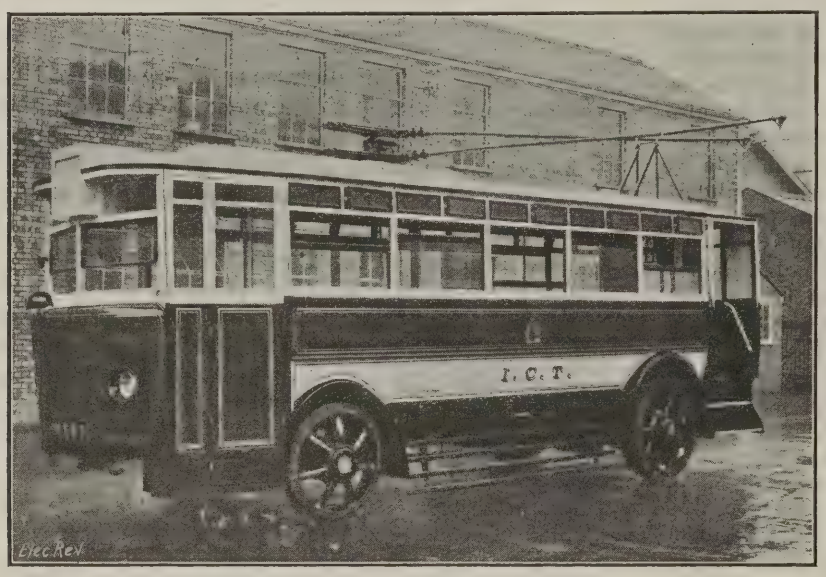

Fig. 1.—Ipswich Corporation Electric Trolley 'Bus.

In order to try such 'buses on a section of about two-thirds of a mile in the centre of the town between The Cornhill and the railway station, which had been run for years as a shuttle service, three electric trolley 'buses were hired from Messrs. Railless, Ltd., and after a few months' use they were purchased, their operation having demonstrated the suitability of this class of vehicle. Last year, therefore, having secured the necessary statutory authority, the Corporation embarked upon the larger scheme of abolishing the tramways in sections. Meanwhile, a further trial had been made between The Cornhill and the Wherstead Road terminus, for which purpose a trolley 'bus of a new design had been supplied by Messrs. Ransomes, Sims & Jefferies, Ltd. Later trials were also made of vehicles loaned by Messrs. Tilling-Stevens and Messrs. R. Garrett & Sons, Ltd.

As the result of inviting tenders for the thirty 'buses required for carrying out the substitution in the eastern district of the town, orders were placed with Messrs. Ransomes, Sims & Jefferies and Messrs. Garrett for fifteen 'buses each, and the Orwell works have already delivered ten of the new 'buses, which incorporate special features.

The chassis is provided with a single motor, capable of developing 50 b.h.p. on the standard rating of the British Engineering Standards Specification for Traction Motors (namely, a run of one hour, during which the temperature of any part of the motor must not rise above that of the atmosphere more than 75 deg. C.), but on the test bed it is called upon to develop 100 b.h.p. for a short while. The controller is of the straight series type, the main drum being operated by a foot pedal, and the reversing drum, which is mechanically interlocked with the main drum, by a lever on one side of the driver's seat. A dial on the dash board has a pointer connected with the controller which indicates to the driver the position of his main-drum contacts at any moment. The power developed by the motor is transmitted to the back axle by a tubular propeller shaft of special steel provided with enclosed universal joints at each end, the couplings of these joints, where attached to the motor shaft and to the worm shaft on the back axle, being provided with plines. The back axle itself is a fine forged-steel casing dished in the centre to receive the worm wheel, differential, and worm unit, which is mounted on the cover, the latter closing in the dished space in the centre of the axle; at each end of the axle a cast-steel bracket carries the extra large brake shoes and their cams.

Each rear wheel is provided with two separate brake drums of pressed steel, both the rear and front wheels being of the cast-steel hollow-spoke type. The rear wheels are provided with twin solid tires, and each front wheel with a single tire.

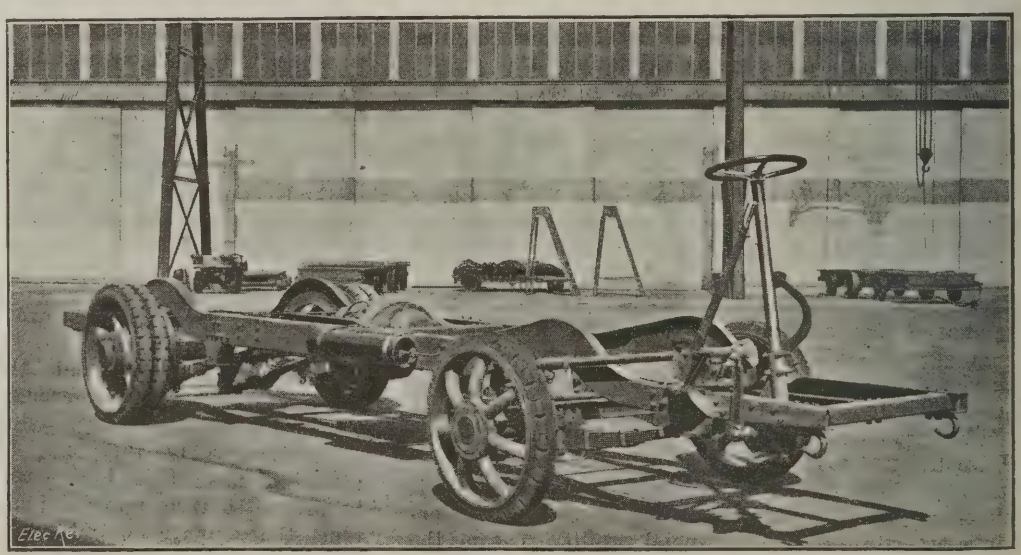

Fig. 2.—Trolley 'Bus Chassis at the Orwell Works.

The brake gear is interesting in so far as the foot brake is operated by compressed air, this equipment having been supplied by the British Air Brake Co. The compressor, and the Ransomes motor which drives it, are mounted on the near side of the main chassis member; the rotary compressor, made by Messrs. Reavell

and Co., is of an entirely new design, and its motor is controlled by an automatic switch in the driver's cab, which is operated by the piston in a cylinder that is controlled in turn by the pressure in the brake reservoir; the working limits of air pressure in the reservoir are 30 lb. and 40 lb. The means of applying the brake is a foot-operated valve on the floor in front of the driver and, in addition, there is a brake operated by a hand lever, which is used in emergency and for holding the vehicle when standing.

The front axle is a drop forging of special steel. The stub axles are so arranged in conjunction with the design of the front wheels that an imaginary projection of the centre line of the swival pin nearly intersects the point of contact of the tire on the roadway, a feature which is characteristic of these new 'buses and assists steering. Specially noteworthy is the excellent springing; each spring is 5 ft. long, and at its forward end is held by a pin passing through a solid eye on the top plate of the spring, and supported in a bracket attached to the main chassis member. Attached to the rear end

Fig. 3.—Interior View of 'Bus.

of the top spring plate is a wearing piece, which bears underneath a roller supported in a bracket attached to the chassis frame, allowing the maximum of freedom for the working of the spring; the vehicles are very smooth riding.

All the bearings throughout the vehicle are of the roller type, including those of the motor. With the exception of the naves of the front wheels and the dished part of the back axle containing the worm gear, where provision is made for oil lubrication, all other points are grease lubricated by means of the "Tecalemit" grease-gun system.

The motor is of Messrs. Ransomes' latest design, and is induced air cooled; the air enters at the forward end of the motor through a special hood and protected opening, and it leaves at the rear end where somewhat different hooding is provided to prevent splashed water (for example, when washing the 'bus) getting into the motor. The motor is so attached to the pressed supporting members that by taking out 8 bolts it can be entirely dropped from the chassis frame for overhaul or replacement; it is equally easy to remove the armature from the motor without detaching the carcase of the latter from the chassis framing.

The bodies of these new vehicles are of somewhat special design, doors being provided for ordinary use at both the front and rear. The front door is in front of the near side wheel, which enables part of the space usually taken up by the driver's cab to be utilised, and when operated as a one-man 'bus enables the driver to receive passengers' fares and issue tickets with greater facility. The intention of the Corporation is to operate the 'buses as one-man vehicles during the slacker periods of the day, but during traffic rush hours to place a conductor on each 'bus, when passengers will use the rear entrance, which is fitted with a pair of folding doors on the near side; they are mechanically connected with the steps, so that when the doors are closed and bolted the steps are folded in the upright position. The front door folds up, and is operated by a lever by the driver.

The interior seating capacity is thirty passengers, with the maximum of standing capacity during rush hours. The floor level of the 'bus when fully loaded is 29 in. at the front-door entrance and 33 in. at the rear-door entrance. The exterior is painted green and the interior decoration is fumed oak and white enamel; the seats are upholstered in green leather cloth, and space is provided between the near side longitudinal seat and the front door for a small quantity of passengers' luggage. The driver is completely screened off from the passengers and has a separate entrance door to his cabin from the front offside.

The interior of the 'bus is illuminated by no fewer than 11 ceiling bulk-head fittings. The destination indicators have been patented by Mr. Clarke, of the Corporation Tramway Department, and one of the accompanying illustrations shows the neat arrangement of the front head-lights, which are so housed that they do not project beyond the surface of the front dash.

The weight of the complete chassis is 3½ tons, and that of the complete 'bus ready for the road is 5 tons 19 cwt. The maximum speed with a full load, on the level, is about 22 m.p.h., and up Bishop's Hill (of which the steepest gradient is 1 in 11) it is about 12 miles per hour. One of the tests is to stop and start when fully laden on the steepest point of the hill, and either brake will stop the 'bus when going at 20 m.p.h. fully laden in from 16 to 20 yards on the level.

In conclusion, it may be remarked that the Company's five works cover 40 acres, the Electric Vehicle Department being accommodated in the factory erected during the war for the manufacture of aeroplanes. Our thanks are due to the directors of the Company for allowing us to see the 'buses in production in the extensive Orwell works and to take part in a demonstration run in the historic old town of Ipswich.

Earth Losses in Radio Sets.

How to Secure a High Efficiency.

By PAUL D. TYERS.

The necessity of a good aerial has recently been emphasized in these columns. It must not be imagined, however, that the aerial is the only important factor determining the performance of a set, however good it may be. The aerial system includes the earth connection, and a really efficient earth connection is again a vital necessity. In the writer's opinion it is no exaggeration to suggest that at least fifty per cent. of the earth connections in use at the present time are not efficient. Let us then briefly consider the most important points which should be observed when making an earth connection.

The lead between the set and the actual point of connection to the earth should be as short as possible. Too fine a size of wire should not be used for the earth lead, nothing smaller than about 16 or 18 gauge really being suitable. It is further advantageous to use an insulated wire for the earth lead, particularly when the set is to be used on the shorter wave lengths.

There are really two ways of making connection to the earth; the first is by burying a conductor of an

appreciable area, and taking a lead from it, while the second is that of making connection to some conductor which is already buried, such as a water pipe. Neither method is more efficient than the other, nor are they equally efficient. The efficiency depends upon the actual conditions of each specific example. If a water pipe is employed, only a main lead pipe should be used, and the wire should preferably be soldered to it, rather than connected by some form of earth clip. Pipes containing screwed joints, such as a gas barrel, should not be employed. If it is found that the water pipe to which an earth connection is to be made travels round the house before going into the ground, it will probably give worse results than a connection consisting of a plate buried directly under the aerial, or near the receiver.

If an efficient connection is to be made, it is essential that the ground should be fairly moist. This necessitates burying the earth plate as deeply as possible. The area of the plate should be at least several square feet, fairly thick copper foil being very useful for the purpose. Where the earth lead is connected to the plate, it is preferable to employ a soldered joint, taking care to remove any traces of flux used in the soldering operation, and finally covering the joint with paint or some form of fairly soft wax, to exclude any moisture from the contact between the two dissimilar metals, which might give rise to electrolytic action from moisture in the ground. Other earthing devices are now on the market in the form of earth plates or mats, or earth tubes. The writer infinitely prefers, as a result of measurements taken, the use of an earth plate to the use of an earth tube or spike simply driven into the ground. The writer has recently examined a number of receivers fitted with earth tubes, which were giving very poor results, the trouble being due to the fact that the earth connection was totally inefficient. It must not be imagined, however, that the earth tube itself is inefficient, the success depending upon the manner in which it is employed. If the tube is simply driven into the ground, it follows that only approximately the lower half of it is in moist surroundings, and accordingly its effective area is halved. The dry earth over the surface of the earth is of little use in making a connection. If the ground happens to be permanently very moist almost to the surface, then substantially the whole area of the tube is useful, but this is seldom the case. When an earth tube is driven in level with the earth, it should be knocked in at least a few more feet with a piece of metal rod of some description, so that the whole area of the tube is completely surrounded with moist ground several feet below the surface. The writer recently found an earth tube driven into a gravel path. Needless to say, the results were very poor indeed.

The effect of a bad earth on a receiver is not only to weaken the signal strength; it also tends to flatten the tuning, and makes the set difficult to manage. It is not at all unusual to be able to increase the signal strength by more than 50 per cent. simply by substituting a good earth connection for one indifferently installed. By paying attention to small points of this nature, the trader will do much to gain the confidence of his clients.

The Settlement of Technical Disputes.

(From our Legal Correspondent.)

It sometimes occurs to those who have the misfortune to be involved in litigation which concerns machinery, or the discussion of highly technical matters, that our recognised tribunals are not best fitted to settle the rights of the parties. Indeed, one might almost put it higher than this, and say that technical people generally are so averse to the risk of being concerned in a lawsuit in the strict sense of the term that they almost invariably have recourse to arbitration. It is not too much to say that hundreds of disputes are settled by this means in the course of a year; and, apart from all else, courts of arbitration are a dire necessity. In the time at their disposal, His Majesty's judges would be wholly unable to cope with the large volume of litigation which is disposed of by these domestic tribunals.

But there remains the question—Is a reference to arbitration best obtained by the clause which is now customarily inserted in technical agreements? Take, for example, that which provides for a reference to two arbitrators—one to be chosen by each party, and an umpire appointed by them in case of difference.

This form of clause necessitates the appointment, in the first place, of two arbitrators who, in the nature of things, are generally partisans from the outset. Failing agreement between them, they appoint an umpire. In the vast majority of cases they "agree to differ" at once and appoint an umpire, who presides at the hearing. The hearing may take a long time. The arbitrators and the umpire are generally busy men, who must be adequately compensated for their services. When the award is made, it need not be published or given up to the parties until the arbitrators' fees are paid; and those fees may be, and often are, wholly out of proportion to the amount in dispute. True, the unsuccessful party will generally be ordered to pay them; but they must be paid, in the first instance, by the party who takes up the award. Having taken it up, he may find that his opponent is directed to pay the fees of the arbitrators and all the costs of the reference. But it is one thing to get an order for John Brown to pay a certain sum of money; it is another and a wholly different thing to get the money. John Brown may "have no wool on his back."

We start, then, with the initial difficulty that he who goes to arbitration may have to pay not only his own lawyer, but the tribunal itself. In a suit at law he may have to pay certain judicature fees; but he is not called upon to pay for the services of a judge.

The curious and cumbersome practice of selecting an expensive tribunal, consisting of two arbitrators and an umpire, may have had its origin in the fact that the parties cannot be certain that, when trouble arises, they will be able to agree upon a single arbitrator; but whatever the origin of the procedure, contracts involving what is, from some points of view, a needless waste of money, have come to be common form. They are signed without either party inquiring, or even pausing to consider, whether there is any alternative; whether disputes, if they arise, cannot be settled in some other way. Least of all does it seem to occur to those who sign such documents that the law of the land may provide for the determination of disputes in a manner which is just as satisfactory and rather less expensive than an ordinary reference to arbitration.

Can those who wish any disputes in which they may be concerned to be settled by arbitration, secure that form of trial before one independent arbitrator? They frequently do so by providing that the reference shall be to an arbitrator appointed (say) by the President of the Institution of Electrical Engineers. That is one satisfactory method. But there is another provided by law. It is to be found in the Arbitration Act, 1889, which states (by S. 5) that where a submission provides that a reference shall be to a single arbitrator and the parties do not concur in the selection of an arbitrator, the Court may make the appointment.

In view of this state of the law, it is sufficient to so frame the arbitration clause as to require the services of a single arbitrator. Failing agreement as to a particular person, either party may apply by what is called an originating summons to a Master in Chambers, who will make a suitable appointment. His discretion

in the matter is entirely unfettered. If it is an engineering case he may appoint an engineer; or if it is a building case he may appoint an architect; but he will generally select some person whom he knows to be skilled not only in his own profession, but in the settlement of disputes. His fees must, of course, be paid by the parties—and will generally have to be paid by the unsuccessful party.

Nor (it is submitted) should those who are involved in a technical dispute adhere too strictly to the view that it will best be adjusted by a technical expert.

It is the general experience of mankind that the best tribunal for determining a question of fact is one presided over by a lawyer accustomed to hear and weigh the value of evidence. He can hear the testimony of experts on one side and experts on the other on a purely technical point and form an opinion as to who are most likely to be correct. He will not always be right; but that is not the point. Is he not *more likely* to be right than a man who has never been trained to sit in judgment? Your expert who takes a biased view on a particular scientific theory or problem would not be the proper person to decide a case which involved the application or consideration of that theory or problem. He would be *ex hypothesi* prejudiced. One recalls a case in which the point for decision was whether a certain picture was or was not the genuine work of an old master. The parties assembled with their witnesses—artists of great eminence—to have the matter determined. The judge, however, intimated that he would prefer to call in an artist of his acquaintance to examine the picture and report to him as to whether the picture was genuine or not. The parties agreed to this course. The story goes that the artist reported that the picture was genuine. Straightway the successful litigant took a taxi and brought this genuine "old master" to a well-known dealer who could find him a customer amongst the millionaires of America. But alas! the dealer refused to hang the picture—pronouncing it a fake!

Again, it should not be forgotten that there are many amongst the lawyers of the present day—to be found within a radius of a few hundred yards from Temple Bar—who are well qualified to sit in judgment in a technical case. The bar of England always has within its ranks men who have spent part of their professional youth in other professions; and even where he has had but a smattering of a technical education, it is marvellous how the man with a legal mind can bring himself to understand the scientific questions which arise in a case. Even lawyers with no technical experience at all have been known to shine in scientific cases. One of the great judges of the past—Lord Parker—was called upon to decide a case in which the whole subject of wireless telegraphy had to be inquired into. His court assumed the aspect of a physical laboratory for about a month. All the greatest experts were summoned before him, and he gave a decision so masterly that it was never appealed from! One of the experts told the writer at the end of the case that of all those who were present in court, there was no one who knew more of the subject than the Judge on the Bench!

A genius like Lord Parker does not make his appearance more than once in a lifetime; but it is hoped that enough has been said to show that in selecting a tribunal for the settlement of technical disputes, the technical man should not wholly ignore the possibility of submitting his case to the decision of a lawyer.

Investigations in Commercial Testing.

Some Noteworthy Applications of the Megger Testing Set.

By G. TAGG, B.Sc.

THE testing of the insulation of electrical equipment, whether it be cables, generators, switchgear, transmission line insulators or house wiring, is of very great importance, and it is the practice of well organised supply authorities to keep card records of the value of the insulation of the various components of their plant. The purpose of these records is to make apparent any deterioration of the insulation, since it is not so much a high value of insulation that is necessary, as constancy during the course of time. All electrical engineers are familiar with the ordinary use of the Megger testing set, but in view of modern requirements, the higher standards demanded, and the necessity of keeping records which should be comparable over a number of years, a few notes on the extended use of the Megger are desirable.

Many years ago telegraph engineers, especially those connected with submarine cables, experienced considerable trouble due to extraneous current affecting their testing instruments; and although the instruments were very highly insulated, it was not found possible to overcome the trouble until Price introduced his guard wire, which had the effect of by-passing the leakage currents so that they did not affect the instruments.

When Mr. S. Evershed designed the Megger testing set some 25 years ago, he took advantage of Price's simple but ingenious arrangement to guard the sensitive indicating movement of the Megger testing set from leakage currents, and thus to secure that the Megger would only indicate the insulation of the object connected to its terminals. The diagram fig. 1 shows how the Price guard system was applied. In this diagram it will be seen that any leakage current passing between the line and earth terminals is trapped by the guard ring and goes back to the generator by a direct path and not through the instrument movement.

For ordinary insulation tests up to 100 megohms, such an instrument is quite satisfactory, but for higher values and special conditions the guard system is connected to an additional terminal marked "Guard" as shown dotted in fig. 1. This enables the operator to guard the apparatus he is testing and also to determine the individual values of several parallel paths by the application of a few simple formulæ. Before deducing these formulæ it is necessary to make the following assumptions:—

(1) The resistances concerned can be treated as separate resistances not in any way interconnected with one another.
(2) The values of these resistances are constant.
(3) The resistances are not altered by the change in direction of the current passing through them.

Consider what happens when three resistances represented by x, y and z are connected, x between the line and earth terminals, y between the line and guard terminals, and z between the guard and earth terminals, as shown in fig. 2. Suppose k equals the total internal resistance of the current circuit, that is equals CR + C. Let the instrument reading be a.

The current circuit is shunted by the resistance y, and hence the proportion of the current through x which passes through C is $y/(y+k)$. But the instrument reading is inversely proportional to the current through the current circuit, as when x is nothing the current is a maximum, and when x is infinity the current is zero. Therefore the instrument reading is increased in the ratio $(y+k)/y$, and so

$$a = x.(y+k)/y \quad \ldots\ldots\ldots\

current circuit as it will pass from the guard terminal straight back to the negative side of the generator. Also the pressure circuit has no effect as none of the current through it passes through the current circuit.

Now reverse the line and earth terminal connections and let the instrument reading be b. This reversal has the effect of changing the positions of y and z relative to the instrument and so by a similar reasoning to the above

$$b = x.(z+k)/z \quad \ldots\ldots(2)$$

Return the line and earth terminal connections to their original positions and reverse the line and guard terminal connections. This has the effect of changing the positions of x and z relative to the instrument, and so if c is the reading

$$c = z.(y+k)/y \quad \ldots\ldots(3)$$

Equations (1), (2), and (3) can now be completely solved for x, y and z, and give

$$x = (bc-ak)/c \quad \ldots\ldots(4)$$
$$y = k(bc-ak)/(ac-bc-ak) \quad \ldots\ldots(5)$$
$$z = (bc-ak)/a \quad \ldots\ldots(6)$$

The above equations involve the total resistance of the current circuit of the Megger testing set being used, which can always be obtained from the makers for any particular instrument if the serial number is mentioned. As an example a 500-volt Megger reading up to 1,000 megohms has a value of k of .3 megohm, while the 1,000-volt instrument has a resistance of .6 megohm.

These equations have been tested not only by using constant wire resistances, but also by experiments on porcelain insulators where the resistances of the paths have been fairly accurately known, and it has been found that the results obtained from these equations are well within the accuracy with which the instrument can be read.

We will now consider the practical application of these formulæ.

Insulators when wet or dirty possess a considerable leakage path over the surface, and there is accordingly a leakage resistance in parallel with the true resistance of the insulator. This has the effect of reducing the apparent resistance of the insulator, and it is difficult to differentiate between a faulty insulator and one which has a low insulation value due to the presence of moisture or other matter forming a leakage path. The result of a test on an insulator would depend not only on its own condition but also on the presence of these leakage paths if a test were taken in the usual manner. In fig. 4 let A represent the overhead line, and B the insulator support.

Then suppose a guard ring were placed round the insulator in some such position as C. This will divide the leakage path over the surface between A and B into two portions. The resistance of that part between A and C may be represented by y, and the resistance of that part between B and C by z. Then if the true resistance of the insulator is represented by x, and A is connected to the line, B to the earth, and C to the guard terminals of a Megger testing set, the diagram of connections will be similar to that in fig. 2.

If the procedure outlined above is then followed, the three equations (4), (5), and (6) will give the values of the true resistance of the insulator and of the two portions of the leakage path. In testing an insulator it is probable that the resistance k will be negligible compared with x, y and z, and so the amount of current which is shunted from the current circuit will be too small to have an appreciable effect on the instrument reading. If this is the case, when the connections are as shown in fig. 2, the instrument will read directly the value of x, the true resistance of the insulator.

This enables faulty insulators to be differentiated from those with considerable leakage paths.

The above method may also be applied to the testing of two-core cables. In the cable shown in fig. 5 there are three resistances concerned, namely, the resistance between the two conductors and the resistance between each conductor and the sheath. Let the resistance between the two conductors A and B be represented by x, that between A and the sheath S be represented by y, and that between B and S by z. Then if A is connected to the line, B to the earth, and S to the guard terminals of a Megger testing set, the diagram of connections will again be similar to that shown in fig. 2, and the above method may be applied. The three equations will then give the values of the resistance between the two conductors and the resistance between each and the sheath as separate values.

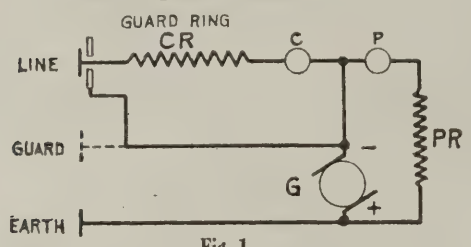

Fig. 1.

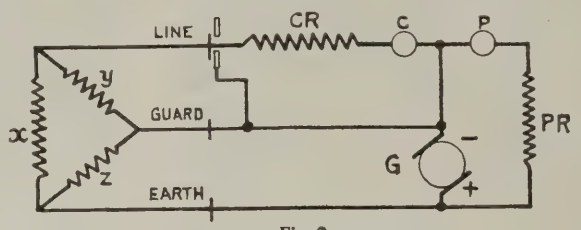

Fig. 2.

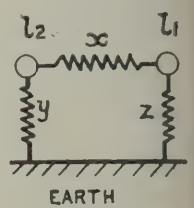

Fig. 3.

The testing of multi-core cables is rather more complicated, due to the presence of more than two conductors. The resistance between any two conductors may, however, be determined by connecting one to the line, the other to the earth terminals, and all the remaining conductors and the sheath to the guard terminal. Using the above method, equation (4) then gives the resistance required. The values obtained from equations (5) and (6) are of little use as they represent the resultant of a number of resistances in parallel.

To determine the resistance between any conductor and the sheath, connect the conductor to the line and the sheath to the earth terminals, and all the remaining conductors to the guard terminal. If the method is again applied equation (4) will give the value required.

House wiring may also be tested by the above method. Consider two wires l_1 and l_2 in fig. 3. Then there is a resistance between them which may be represented by x, and also resistances between each and earth which may be represented by y and z respectively. Then if l_1 is connected to the line terminal, l_2, to the earth terminal, and the earth to the guard terminal of a Megger testing set, the connections will be similar to those shown in fig. 2. The equations (4), (5) and (6) will then give the resistances required.

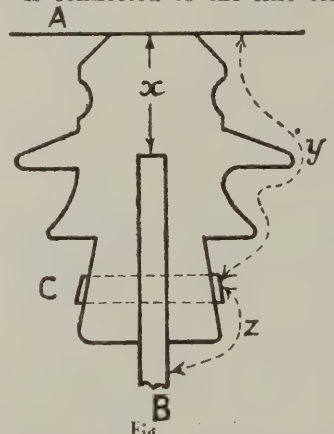

Fig.

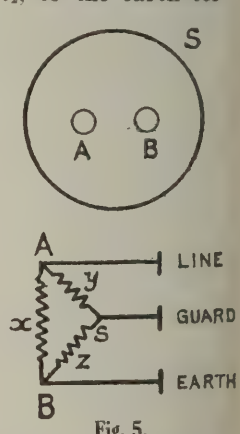

Fig. 5.

The instruments which are generally used for testing house wiring do not possess a separate guard terminal, but connection can be made to the guard ring by pushing a thin piece of metal or the flattened end of a piece of wire in between the guard ring and the line terminal insulator. It is advisable to apply the testing pressure for a few moments before taking the readings to allow for the effect of electrical osmosis.

From the above it will be seen that the use of the guard terminal, and it may be, of a guard ring, simpli-

fies the testing of many portions of electrical equipment, which, if tested in the ordinary way, are likely to give erroneous results. In most cases the instrument will be direct reading because the resistance of the current circuit of the Megger testing set will be negligible compared with the resistance under test, thus making the current shunted from the current circuit extremely small. The above method is particularly useful when testing insulators, as leakage resistance may be separated from the true resistance. It should be noted that the method will only show up faulty insulators if the faults are in such a state that they will reduce the resistance of the insulator.

If the insulator were cracked, for example, a test in very dry weather would not show up the fault, as the crack would be filled with dry air which is itself a good insulator. The fault would only show up if the crack were filled with moisture or dirt.

Testing without using a guarded system is rather unsatisfactory, as resistances are introduced of which it is not easy to take account, and it is accordingly advisable always to use a guarded circuit where possible.

Modern Electric Lifts.

The New Department-Store Control Installation at Harrods's Stores.

A CONSIDERABLE and important advance on what had previously been done in the production and operation of electrically-driven lifts is represented in the development, by Messrs. Waygood Otis, Ltd., of the department-store control system of electric-lift operation, by

Fig. 1.—Lift Bank, Top Floor.

which, it is claimed, a service increase of 50 per cent. is obtained above that by lifts employing the ordinary resistance car-switch control. The principal feature of this new method of control is multi-voltage supply regulation of the driving motor. This machine is supplied with energy from a motor-generator and the elevator movement is governed by automatically regulating the pressure of the generating unit, which is directly supplied to the armature of the driving motor.

Some particulars of a recent installation of electric lifts employing this new control system will probably prove of interest to most electrical engineers. The equipment referred to may be seen at the Brompton Road stores of Messrs. Harrods, Ltd., and has been working since Christmas last with satisfactory results. The installation consists of a bank of four identical lifts arranged side by side, fig. 1. Each is operated by a 25-h.p. motor, fig. 2, driven from a motor-generator of the same capacity. A feature of the apparatus is the employment of a traction sheave for the lift drive. The driving portion of the sheave is mounted directly on the armature shaft, and, its diameter being only slightly larger than that of the armature, the lift speed closely approximates to the peripheral speed of the driving rotor. As already mentioned, the speed regulation of the motor, and in consequence the lift car, is effected by variation of the supply pressure from the generator, which ranges from 200 V to 12-15 V, representing the maximum and minimum motor speeds of 102 and about 7 r.p.m. The brake drum is an integral part of the armature cylinder and the spring-controlled brake shoes are held in the off position by brake magnet coils mounted on the motor frame. The motor bearings are provided with chain lubrication.

The main control medium between the car and the generator consists of a pawl-coil unit mounted on, and free to move along, a screwed, vertical, steel rod which is tape driven from the car, and as the rod revolves the pawl device travels up or down the thread of the rod, according to the direction of rotation of the rod, the limits of travel representing those of the actual car between its top and bottom stages. Two pawls are employed, one at each end of the coil, and each works in co-operation with a separate selector rod. Each rod is equipped with four collars which are spaced out, in relation to the travel of the pawl unit, so as to represent the floor stages of the lift, four up on one rod and four down on the other. The pawls are controlled from the car to engage or disengage with the necessary collars when required. The rods each actuate four selector switches controlling four of the five governing relays for the pressure regulation. As the car, and with it the pawl unit, rises or falls, the pawl corresponding to the direction of the lift travel is operated to engage the collar representing the next floor to be reached when the coil arrives at the necessary position. The coil continues to travel on engaging with the collar and lifts or lowers the rod according to the direction of

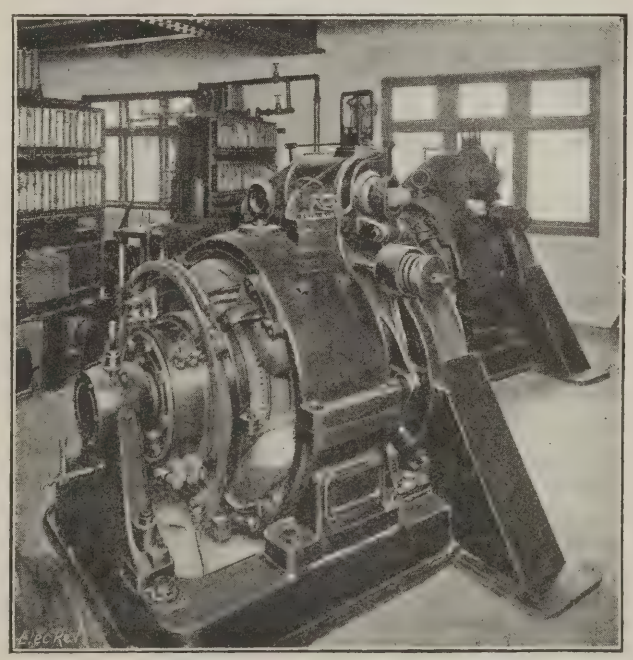

Fig. 2.—Light-Driving Motor.

motion of the lift. The rod movement actuates the selector switches and the car is stopped. The reverse operation takes place when it is required to start the

elevator, the pawl being disengaged from the collar. Normally the car reverses only at the top and bottom stages, but an emergency direction-changing device is installed for operation at the intermediate stages, should that be necessary.

The fifth pressure-varying relay is only called into service when the load on the lift is severe, and it is automatically and electrically operated. The relays are controlled by reactance coils to give them the correct working sequence. They are mounted on the control board, fig. 3, which also accommodates the main relay equipment, directly controlling the motor-generator switchgear and field-reversing relays for the necessary direction control of the motor. A small auxiliary relay is operated from the car, and in turn controls the main relay and a d.p. switch which excites an automatic rheostat, interlocking relay, and the main control devices.

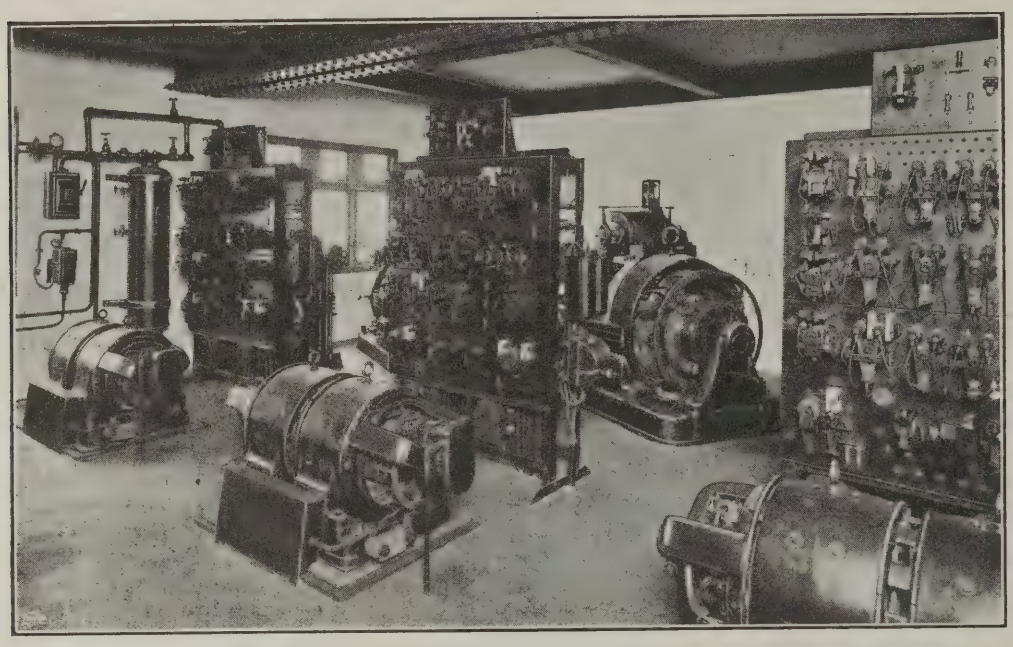

Fig. 3.—Lift-Control Room.

An operating panel is installed in a convenient position in the car and contains the operating handles and the emergency and safety control switches. The auxiliary relay on the control board is operated by a Yale-key switch, a small lamp indicating when this is on. A lever switch operates the pawl unit, thus starting or stopping the car. In the normal position this is arranged with a dead-man action. A safety switch under a glass face can be operated to cut the whole supply off in the case of failure.

Both the car and hatchway doors are operated by means of air pressure which is electrically controlled by a small motor situated on the roof of the car. The motor opens a valve governing the air supply and is brought into operation at the half-way position of the lever switch. The air supply is maintained between the required limits of pressure by means of an electrically-driven pump, a piston switch that automatically operates the motor being actuated under the air pressure. The driving and controlling machinery for the four lifts is installed in a special 2-storey room located on the roof immediately above the lifts. The motor generators, motors, control boards, selector-switch equipment and the air-pump gear are located in the top storey, fig. 3, and the lower floor accommodates the lower part of the traction sheave, the lift governor apparatus and the tape-driving equipment for the pawl-unit spindle.

The elevators are self-levelling, and maintain the car floor at the hatchway level during the loading operations. As the loads increase the self-levelling device compensates for the tension on the cables. A particular feature of the lifts, due to the multi-voltage control, is the rapid and smooth movement of the car. The usual "up" and "down" hall lanterns above the car doors signal to waiting passengers the approach of the car and indicate when it is stopped at the landing. If desired an annunciator may be installed in one or more cars and signal buttons in the halls for night service.

In conclusion, we are indebted to Messrs. Waygood-Otis, Ltd., and Messrs. Harrods, Ltd., for their courtesy in giving us facilities to inspect the installation.

A Swiss Hydro-Electric Installation.

Some Details of the Lake Tremorgio Plant.

Although the hydro-electric station which was completed last year near Rodi, in Southern Switzerland, for the Società Officine Elettriche Ticinese, and some particulars of which were recently given in the Electrical Review, only so far comprises a single 15,000-h.p. set, the installation is interesting owing to the many engineering difficulties which have had to be overcome. The power is derived from Lake Tremorgio, which lies up in the snow at an altitude of 6,000 ft. above sea level, and which is mainly fed by the Lagasca stream, a tributary of the River Tessin. When carefully measured, the lake was found to cover an area of about 670 acres, to have a maximum depth of roundly 180 ft., and an approximate capacity of 2,420 million gallons of water. Following the preliminary surveys, it was decided to reduce the depth of the lake by about half and its capacity to about 1,687 million gallons.

Owing to the steep sides of the lake being usually covered with snow, and the fact that avalanches have to be contended with, it was decided to draw the water from the lake by a tunnel, which commences at a point about 85 ft. below the lake level, and extends through

Fig. 1.—Rodi Hydro-Electric Station.

the mountain for a distance of 783 ft. The first 205 ft. of the tunnel practically forms an extension of the lake, for at that point, at the bottom of a vertical shaft 120 ft. deep, sluice gates have been interposed. The lake end

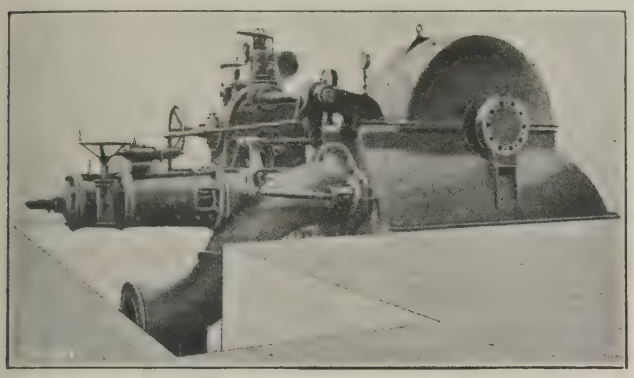

Fig. 2.—Pelton-Type Turbine.

of the first portion of the tunnel is oblong in section, this being followed by a part which has straight sides and bottom with a rounded top, the width varying from 3 ft. 11 in. to 4 ft. 6 in., and the height from 4 ft. 6 in. to 5 ft. 2 in. The portion of the tunnel behind the sluice gates is circular in section, the diameter ranging from 4 ft. 11 in. to 5 ft. 11 in.; part of it is lined to prevent leakage, with cement, and part with "Gunite."

At a point on the mountain side where the tunnel ends, 5,877 ft. above the sea, the water will be diverted into two conduits, only one of which, however, is at present installed. At this point a water-inlet control house has been established, provision being made both for hand and remote—from the power station—control. The conduits are of welded steel, and are partly laid in tunnel and partly in the open, although in many places, owing to the risk of avalanches, a protective covering for the pipes has had to be provided. The head between the control house and the power station is 2,775 ft. The conduit pipe is, however, 5,179 ft. in length owing to various turns in its direction being necessary. The average angle of slope of the pipes is 68 per cent., while in some portions the angle reaches 230 per cent. It will thus be readily realised that the work of construction was extremely arduous, necessitating the construction of both a temporary cable railway and a cable ropeway. Indeed, even for Switzerland, the steep angle of 230 per cent. is regarded as unusual.

The conduit is divided into four sections, the diameter ranging from 27.5 in. at the top down to 21.6 in. at the bottom, the thickness of the pipes increasing proportionately from 7 to 29 mm., while, in order to prevent rust, the pipes throughout their entire length were given a coating both internally and externally of asphaltic tar.

The power station is located near the village of Rodi; the building, fig. 1, which has been designed for easy extension, is in the Roman style, and of stone from the local quarries. At present the floor area is 64 ft. by 24½ ft., amply sufficient to contain a 15,000-h.p. Pelton-type turbine, fig. 2, constructed by Escher Wyss and Co., of Zurich, driving at 750 r.p.m., a 10,000-kVA, three-phase alternator built by the Brown, Boveri Co., of Baden, the current being generated at 8,400 V, 50 periods. The plant also includes a Brown, Boveri transformer, which steps up the current for transmission purposes to 50,000 V.

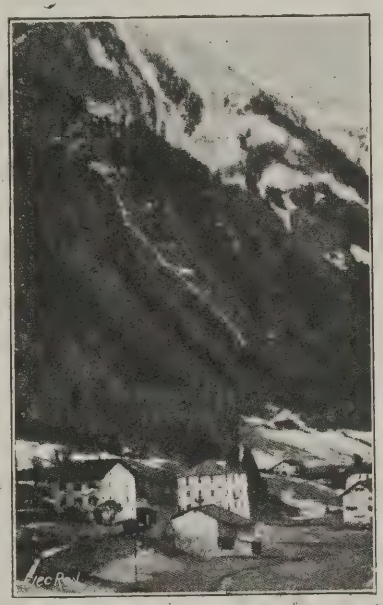

Fig. 3.—Bottom Conduit Section.

Fig. 4.—Conduit Erection.

Figs. 3 and 4 show, respectively, the bottom section of the conduit, and the conduit being fixed at an angle of 230 per cent.

Women and Home Lighting.

Successful Convention in London.

On Thursday and Friday last week, April 29th and 30th, London was the centre for ladies connected with various electrical undertakings, companies, and firms in various parts of the United Kingdom. By invitation of the Electric Lamp Manufacturers' Association they came from far and near—some from electricity showrooms, others from the showrooms of manufacturers, wholesalers and contractors, and yet others by invitation of the Electrical Association for Women, to attend the First Home Lighting Course for Women at the E.L.M.A. Lighting Service Bureau in Savoy Street.

The proceedings were divided each day into a morning and afternoon session, and under the chairmanship of Mr. W. E. Bush, the manager of the Bureau, and the experienced lecturing of members of E.L.M.A.'s expert staff, some sixty ladies were initiated into some of the problems of illumination. Such matters as lighting progress down the ages culminating in the modern electric lamp, the control of light, modern wiring systems, lighting fundamentals, light as a decorative medium, comparisons of good and bad lighting, selling light (showroom, window, and other demonstration), and the possibilities of better lighting in the home and the need for campaigning to secure it, were all parts of the theme. The "students" had excellent opportunities for asking questions which had arisen in the course of their own business occupations, and no doubt they are all back in their places this week far better equipped for rendering efficient electrical service, having at command many new talking points with which to persuade existing and potential consumers.

How well-conceived was the whole scheme will be recognised when we mention that the Bureau under-

took, through its staff, the reserving of hotel accommodation for such of the visiting students as required it for the period of their stay in London. How appreciative they all were of the efforts that had been made for their comfort and instruction, for the facilities that their employing undertakings, &c., had afforded them to be absent from their ordinary duties so as to attend the course, was amply demonstrated by the most excellent spirit which characterised an informal dinner which took place at the Florence Restaurant last Friday evening, as the concluding function in the programme.

Mr. C. W. Sully, Director of E.L.M.A., presided at the dinner. He proposed a toast including all kinds of guests who were present. The speeches were few and brief. Miss Holm returned thanks on behalf of the visitors from the provinces, and Mrs. Hollis on behalf of those from London and its suburbs, while Miss Haslett spoke appropriately concerning the work of the Electrical Association for Women. Mr. J. W. Beauchamp, Director of E.D.A., followed, and Mr. A. H. Bridge (Electrical Review) responded for the Press.

The musical programme delighted the audience immensely, and it was obvious that the dinner formed a very popular means for winding up a thoroughly popular course; perhaps the most homely and human touch of all was the presentation of a box of chocolates to Miss Hodge, who had been so charming a Fairy Godmother to all the women during their stay.

"Students" at the E.L.M.A. Home Lighting Course for Women.

As the occasion was one of a quite exceptional character, and in order to indicate how representative it was, we give below the names of most of the "students"; a few others who attended were members of the Electrical Association for Women, but their names were not registered. We also reproduce a group photograph taken on the steps of the I.E.E. building during the course.

Miss M. de Gruchy, Croydon Electricity Department.
Miss M. F. McDonald, G.E.C., Birmingham.
Miss Veda Brice, Beckenham U.D.C. Electrical Department.
Mrs. V. K. Shepherd, member of Electrical Assn. for Women.
Miss A. Jackson, Lighting Service Bureau, Newcastle.
Miss K. S. Lindsey, Lighting Service Bureau, Glasgow.
Miss F. M. Ridley, G.E.C., Newcastle.
Miss R. F. Kennedy, Corp. Electricity Dept., Glasgow.
Miss Crane, Chingford Electricity Supply Co.
Miss Winterbottom, Metro-Vick Supplies, Ltd.
Miss U. O'Connor, J. W. Russel, Watford.
Miss F. Swire, Hackney Electric Supply Dept.
Mrs. Hollis, West Ham Electricity Dept.
Miss D. Bentley and Miss O. Bull, Stoke-on-Trent Electricity Dept.
Mrs. Boysons, Electricity Works, Epsom.
Miss H. W. Forbes, North Metropolitan Electric Power Supply Co., Enfield.
Miss C. Carter, Sevenoaks and District Electricity Co.
Miss I. Clements, Stoke Newington Borough Electricity Dept.
Miss M. Selbey, member Electrical Association for Women.
Mrs. E. A. Clement and Mrs. J. Tyler, South Wales Electric Power Co., Cardiff.
Miss G. C. Senior, G.E.C., Cardiff.
Mrs. Peel and Miss Lee, G.E.C., London.
Misses F. M. Upchurch and D. M. Geddes, North Metropolitan Electric Power Supply Co., Palmer's Green.
Miss Mioprio, North Metropolitan Electric Power Supply Co.
Miss O. Holt and Miss Green, Edison Swan Electric Co., London.
Miss J. Dent, J. C. White, Manchester.
Miss Davies, Wolverhampton Electricity Dept.
Miss Pedler, B.T.-H. Co., Birmingham.
Miss E. Kerswill and Miss R. Pecken, Bristol Corporation Electricity Department.
Miss A. A. Stemp, Cheltenham Corporation Electricity Dept.
Miss G. Busby, North Met. Electric Power Supply Co., Edmonton.
Miss E. Dickinson, Bermondsey Borough Council.
Miss F. M. Simpson, North Met. Electric Power Supply Co., Edgware.
Miss J. Clayton, North Met. Electric Power Supply Co., Tottenham.
Miss A. Holm, Newcastle Electricity Supply Co.
Mrs. Arnold and Miss M. Fox, City of Bradford Electricity Dept.
Miss J. Lees, Siemens & English Electric Lamp Co., Ltd., London.
Mrs. Cross, Westminster Electric Supply Corporation.
Miss Hansell, North Met. Electric Power Supply Co., St. Albans.
Miss J. P. Lewis, member of Electrical Assn. for Women.
Miss E. M. Sheret, North Met. Electric Power Supply Co., Wembley.
Miss A. B. Watson and Miss M. Greenhill, representatives of "Good Housekeeping."
Mrs. C. Taylor, representative of "E.D.A."
Mrs. O. Fletcher and Mrs. A. L. Walker, North Met. Electric Power Supply Co., Barnet.
Miss Haslett, director, Electrical Assn. for Women.
Miss B. Moss, Tottenham Light, Heat and Power Co.

Loud-speakers in Bath Abbey.—As in many other historical buildings in the United Kingdom, the acoustics of Bath Abbey are unfortunately bad. Services conducted from the pulpit and lectern are inaudible to half the congregation, and loud-speakers have accordingly been installed in order to overcome the various difficulties. A Marconiphone No. 1 "Public Address" equipment has been used for the purpose with a microphone on the pulpit and lectern and two loud-speakers suitably mounted in the organ loft. The amplifier and control outfit is housed in a cellar-like compartment leading to the transept, and comprises a charging board, amplifier, and a sub-control. From this point a microphone can be switched in and out of circuit as required. It was found that one of the loud-speakers required less volume than the other, and suitable damping apparatus was incorporated in order that proper acoustic balance should be maintained.

Electricity Supply in Great Britain.—XV.

North Wales.

The counties of Anglesey, Carnarvon, Denbigh, Flint, Merioneth and Montgomery comprise the greater part of the area of the North Wales and South Cheshire Electricity District, as approved by Parliament.

The map of these six counties has not been reproduced, but copies of the map are available if required.

The 1921 Census gives the following particulars for these Administrative Counties:—

Administrative County.	Acres.	Persons.	Resident families.	Buildings not containing dwellings.
Anglesey ...	176,630	51,744	12,847	1,020
Carnarvon ...	366,005	130,975	31,537	2,446
Denbigh ...	426,080	154,842	33,975	2,472
Flint ...	163,707	106,617	23,002	1,914
Merioneth ...	422,372	45,087	10,758	1,238
Montgomery	510,110	51,263	12,064	1,092
Total ...	2,064,904	540,528	124,183	10,182

The number of kWh generated in Area No. 6 (which includes the output of the generating stations owned by the Chester and Crewe Corporations and those owned by companies at Aberystwyth and Oswestry, as well as the output of the generating stations in the above six counties) is given in Table 8 of the Electricity Commissioners' publication, "Generation of Electricity in Great Britain."

Year ending March 31st.	kWh generated. Area No. 6.
1922	38.990,369
1923	41,753,834
1924	52,407,347
1925	59,834,945

Table 8 also gives the following figures for kWh generated by water power:—

Year ending March 31st.	kWh generated by water power. Area No. 6.	Great Britain.*
1922 ...	27,035,496 ...	29,107,036
1923 ...	29,074,884 ...	31.823,031
1924 ...	40,704,029 ...	44,094,796
1925 ...	46,768,001 ...	51,093,237

*In Appendix I to the Weir Report, the available water power in Great Britain is estimated to be capable of giving an output of 2,120,000,000 kWh per annum.

The following is a list of the existing authorised undertakers:—

Local Authorities.

Abergele and Pensarn Urban District Council.
Bangor Corporation.
Bethesda Urban District Council.
Bettws-y-Coed Urban District Council.
Carnarvon Corporation.
Colwyn Bay Urban District Council.
Connah's Quay Urban District Council.
Conway Corporation.
Hawarden Rural District Council.
Holyhead Urban District Council.
Llandudno Urban District Council.
Llanfairfechan Urban District Council.
Llangollen Urban District Council.
Menai Bridge Urban District Council.
Mold Urban District Council.
Penmaenmawr Urban District Council.
Prestatyn Urban District Council.
Pwllheli Corporation.
Rhyl Urban District Council.
Wrexham Corporation.

Companies.

Llanrwst Electricity Supply Co., Ltd.
North Wales Power Co., Ltd.
North-Western Electricity and Power Gas Co.
Ruthin Electric Supply Co., Ltd.

Authorised Persons.

Assheton Smith, G.W.D., Esq., and Successors.

Applications for Special Orders under Section 26 of the Electricity (Supply) Act, 1919, have been lodged by the following:—

Wrexham Corporation (Extension).
Colwyn Bay Urban District Council (Extension).
Wrexham Rural District Council.
Portmadoc Urban District Council.
Gwynedd Trust, Ltd.
Executors of Mrs. M. A. Owen.

Further particulars of these applications are given in the Fifth Annual Report of the Electricity Commissioners and also in the Report of the North Wales and South Cheshire Joint Electricity Authority for the year ended March 31st, 1925.

In this connection it is stated (on page 12, paragraphs 35 and 36, of the Electricity Commissioners' Fifth Annual Report) that:—

"Since the coming into force of the District Order, the North Wales Power Company has pressed forward actively with the establishment of the transmission scheme, and the marked progress already made has not only resulted in the supersession of local generation at a number of centres owing to the availability of bulk supplies, but has also stimulated a number of applications for Special Orders for distribution powers in new areas capable of being developed by means of supplies from the transmission system."

"The practical results of the steps already taken to improve the organisation for the supply of electricity in this District provide an informative indication of the manner in which re-organisation and further development is accelerated as a consequence of the establishment of a comprehensive transmission system over a wide area."

Marine Life-Saving Services.—In April, 1923, the control of H.M. Coastguard passed from the Admiralty to the Board of Trade, the force being reconstituted primarily for life-saving duties, and in December, 1925, the Coastguard Act, 1925, was passed. The shore signal stations maintained by the Admiralty for Naval purposes and on behalf of Lloyd's (19 in number) participate in the life-saving organisation, the Board of Trade making an annual payment to the Admiralty in respect of such services.

Electrical communication naturally takes a prominent place in a life-saving organisation. Consequently, wherever possible, every coastguard station, look-out position, volunteer-in-charge and watchman-in-charge is connected to the exchange telephone system of the country. Certain lifeboat authorities are also provided with telephone facilities at the charge of the Board of Trade. In localities where the exchange system is not sufficiently developed, private circuits connecting two or more coastguard stations are provided with the necessary extensions to the look-out positions and lifeboat authorities in the neighbourhood. Provision of telephone facilities for life-saving purposes is also made to selected lighthouses and light-vessels, but in the case of lightvessels telephone cables are being gradually superseded by wireless telephony. Under this system a group of lightvessels are in communication by wireless telephone with a centrally situated coastguard station. In the United Kingdom wireless communication with vessels at sea, other than those of His Majesty's Navy, is conducted by a number of coast wireless stations under the control of the Postmaster-General. For each of these stations and also for each of the Admiralty wireless stations, there is a liaison coastguard station situated adjacent to, and in close telephonic touch with, the coast wireless station, to which the wireless station reports immediately any S.O.S. signal is received from a vessel within a certain defined area, including the British Isles. It is then the duty of the liaison coastguard station to plot the position given in the S.O.S. signal on a chart and then dispatch it to the officer of coastguard off whose district the vessel in distress is situated. This officer initiates the necessary steps for the dispatch of appropriate assistance, informing the liaison station of the action taken, which in turn passes on the information to the wireless station in order that the vessel in distress may be acquainted that assistance is forthcoming. Special priority is afforded by the Postmaster-General to all messages transmitted on life-saving service by telephone or telegraph.

The I.E.C. Meeting in America.—II.

A Cursory Account of the Proceedings.

By PHEIDIPPIDES.

The subjects dealt with at the Conference were as follows:—

Nomenclature.
Symbols.
Rules and Regulations for Transmission Lines.
Rating of Electrical Machinery.
Standard Pressures.
Transformer Oils.
Prime Movers, Steam Turbines.
Prime Movers, Hydraulic Turbines.
Traction Motors.
Terminal Markings.
Lamp Caps and Holders.

The opening technical session of the Conference, presided over by Signor Semenza, was occupied by the reading and discussion of papers by experts on different aspects of the question of machinery rating. The authors and titles were as follows:—

Dr. A. E. Kennelly:—"Can the Thermal Capacity of Electrical Machines be made a Simple and Practical Element of Rating?"

Prof. E. Morelli:—"The true meaning of Ambient Temperature, Limits of Temperature, and Temperature Rise."

Mr. Roger T. Smith.—"Ambient Temperature as a Testing Temperature of Reference, and as a Climatic Entity."

Papers were read by Mr. A. Huber Ruf and Dr. H. Behn-Eschenberg, Mr. C. Rodgers, Mr. Frans Dupont, Dr. M. Kloss, and Mr. R. Liljeblod, on the question: "What is the Importance of Overload Requirements, and what are the Main Reasons for the Same?"

The papers emphasised the fact that a motor was usually called on to give an average output plus an intermittent overload, and then discussed how this was looked after in different countries. The British practice is to limit the temperature rise for the average load to such a figure, 40 deg. C., that the usual over-loads are automatically cared for, while on the Continent the practice is to adopt a continuous maximum rating with a 50-deg. rise, known as the I.E.C. standard rating. With the latter system of rating there is obviously no demand for over-load. In this country all difficulty in the use of the two systems has been overcome by showing when desired both ratings on the name plate. As regards the question of ambient temperature of reference, the British delegation favoured the retention of a standard of reference. At the conclusion of a long and interesting discussion, it was decided to advise the Rating Committee that there was no general demand for an over-load on the I.E.C. 50 deg. C. continuous maximum rating. The British 40 deg. C. rating would, of course, remain the standard for Great Britain.

Transmission Line Difficulties in Morocco.—In a recent issue of the house organ of the Compagnie Francaise Thomson-Houston, of Paris, reference is made to the difficulties which have been experienced in Morocco in connection with the 60,000-V transmission line between Casablanca and Rabat, owing to the large number of storks in that country. These large birds quickly discovered that the masts provided a means of building more stable nests than was possible in trees and chimneys. Although the nests have not caused any difficulties in connection either with the transmission line or the masts, considerable trouble has been experienced with the insulators, which have been much soiled by the excreta of the birds, but the difficulty has been overcome by the provision of smooth surface shields on which the storks cannot get a footing and by the construction of stork-perches in the vicinity of the lines.

Chilean Trade and Development.

More Propaganda Needed.

Mr. W. F. Vaughan Scott (British Commercial Secretary at Santiago) has forwarded a report on the industrial and economic situation in Chile (dated September, 1925) to the Department of Overseas Trade.* In his introduction and general review of the situation, Mr. Vaughan Scott says that the British Empire was the principal supplier of goods to Chile during 1924, providing 26 per cent. of the total as compared with 23 per cent. supplied by the United States. Germany's share was 13 per cent. As regarded Chilean exports, the United States was the principal customer, with 41 per cent., while Great Britain occupied second place with 34 per cent.

It is considered that Chile has awakened from the static *regimé* of ultra-conservatism of many generations, and this has brought into play new energies which, if left unhindered, spell great expansion in trade. Among the many enterprises which are in prospect are a number of hydro-electric developments of importance.

Trading Methods.

Mr. Vaughan Scott deals very fully with the trading conditions in Chile. He says that our manufacturers must recognise the fact that practically every civilised nation has to-day entered into competition and is manufacturing every conceivable class of goods, at the same time jealously protecting and fostering these new industries. The fact that these nations have attained such rapid industrial development in a very few years makes it necessary for us to exert every effort if we are to maintain our relative position in, say, 20 years' time. The traditional individualism of the British manufacturer, which in the past has often stood him in such good stead, is to-day a source of disadvantage, and there is still a great deal too much fear of the man on the other side of the road knowing what the man on this side is doing. Success can only be maintained by co-operation, and, generally speaking, by specialisation. The handicap of high prices which is so evident in the bulk of foreign markets, can be greatly lessened by efficient salesmanship and propaganda, and frequently can be overcome altogether by these means. United States manufacturers, in particular, have realised this, and though their propaganda costs them a great deal of money, they are reaping the benefit. It is time that our "Buy British goods" campaign was extended in appropriate form beyond Great Britain and the Dominions. British manufacturers already have abroad the finest network for distribution that any nation could desire. Trading conditions are also dealt with in a sub-report by Mr. S. H. Gudgeon (Vice-Consul at Iquique), who says that one effect of the keener competition of the last few years has been to bring the producer into closer touch with the consumer. To-day many manufacturers are represented by a travelling agent, or perhaps by a small firm which places its orders direct with its principals, on a purely commercial basis.

With regard to the investment of capital, Mr. Vaughan Scott says that American capital is eagerly welcomed in Chile, and fresh British capital would be equally welcomed. In the interests of our future trade in this country it is most important that our investments should be increased and not decreased, as is the present case. An important and growing market exists in Chile for mining equipment, including steam boilers and engines, gas engines, water turbines, electric motors, converters, and other machinery.

Copper Production.

During the year under review the copper mining industry satisfactorily progressed in spite of a shortage of water power, which reduced the output. Exports of bar copper during the years 1923 and 1924 and the first 10 months of 1925 were 162,419 tons, 181,442 tons and 130,362 tons respectively. Chile already ranks second, after the United States, as a copper-producing country, and during the next few years she will increase her production by a further 190,000,000 lb. per annum, as a result of the decision of the Anaconda Copper Co. to complete the installation of the Andes Copper Co.'s mine at Potrerillos. The Chile Exploration Co. (New York) at Chuquicamata, near Antofagasta, has continued to produce and export very pure copper in bars.

Railway Electrification.

Among the railway developments which are in hand is the electrification of the Transandine Railways. The locomotives for this system have been ordered from Switzerland, as it is stated that British and United States manufacturers have less experience in rack railway equipment. Power will be supplied by the Maitenes power station, belonging to the Compania Chilena de Electricidad, which supplies Santiago and the first section of the State Railway to Valparaiso. The completion of the electrification of the line from Santiago has resulted in greatly accelerated service for goods and passengers. The improvements being carried out are the installation of automatic brakes and couplings, a feeder line for electrical energy for lighting stations, improvements in signals and points, &c. The administration of the First Zone has drawn up a plan of improvements, and estimates the cost at £5,000,000, for which a loan will have to be raised.

---

*H.M. Stationery Office. 2s. 6d. net.

The Nitrate Railway Co., in order to counteract the accumulative deterioration of its property, submitted a scheme to the Government involving an expenditure of £1,250,000, which provided for the introduction of several general improvements, and in particular the electrification of the heavy-grade section. Owing, however, to the failure of the company to secure an extension of its concession, the electrification scheme was abandoned.

Radio Telephony and Telegraphy.

Radio-telephony continues to make progress in Chile, but the trade is still in the hands of foreign competitors, the bulk of it being done by United States manufacturers, followed by Germany. Probably all the business done by Great Britain only amounts to 10 per cent. The number of broadcasting receiving sets at present in use is about 45,000, as compared with 12,500 a year ago. During 1924 the only broadcasting station in operation was that of the Radio Chilena Corporation, but since then four large stations have been installed—three at Santiago and one at Concepçion. Beyond these there are nearly 24 stations erected by newspapers, business firms, and others. The first law dealing with broadcasting was passed in 1925. Under this decree the Republic is divided into seven zones, in each of which only two broadcasting stations of the first category may be installed, *i.e.*, with power of 1 kW or more, which must use wave-lengths between 350 and 425 metres or 475 and 545 metres. The wave-lengths of the stations situated in the same zone must have a minimum difference of 100 metres, and there must be a difference of 50 metres between contiguous zones. A radio transmission station cannot be installed at less than 28 km. from permanent Government stations. The Government has stations at Valparaiso, Talcahuano, Frutillar, Punta Arenas, and will shortly have one at Arica. The naval wireless station near Antofagasta, constructed under the supervision of Messrs. Marconi, was finished and opened in January, 1925. The station is in existence primarily for naval purposes, but commercial and ordinary messages can also be transmitted and received. The service, however, is apt to be dilatory, and so has proved of little value commercially.

Trade in Electrical Goods.

Mr. V. V. Cusden (Vice-Consul at Valparaiso) says that the market in that district for electrical apparatus and accessories is held principally by German and American firms, there being a comparatively small sale of British-made goods. This is probably partly accounted for by the fact that British goods are more expensive, being of a superior quality, and therefore not so attractive to the Chilean market. In the Concepçion, Coronel, and Lota district, according to Mr. E. Cooper (British Consul at Concepçion), practically all of the electrical goods are supplied by Germany.

General.

The large construction programme undertaken by the Compania de Electricidad de Valparaiso, after it acquired the properties about two years ago, has been practically completed; the company is giving a more efficient service and is able to extend the use of electricity. A number of factories have changed over their plants to the more economical electric power, and others will shortly do the same. As a consequence, the power consumption has doubled during the last year, the number of users has increased by about 2,000, and the total sale of energy by about 3,000,000 kWh. The tramway system at Valparaiso and suburbs is efficient, but it is not at present a paying concern. The new cars on the Viña del Mar route are giving excellent service, and are well patronised, but motor-'bus competition is very keen.

A proposal is on foot to hold an international industrial exhibition at Viña del Mar in September, 1927.

The revision of the import duties has remained in abeyance, but will probably be dealt with during the current year.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Advertisement Correction.—We regret to find that in the advertisement of the WANDSWORTH ELECTRICAL MANUFACTURING CO., LTD., appearing in our issue of April 30th, a printers' error occurred in the type relating to one of the forms of switch made by the company—the last of all. For "*Imported* Quick-Make and Break," &c., read *Improved*.

The London Chamber of Commerce.—Among the matters dealt with in the Chamber's 44th annual report (1925), are electricity supply in the City, merchandise marks, national and local economy, rating and valuation, &c. With regard to the first subject, mention is made of the joint action taken by the Chamber and the City Corporation, as a result of which the charges for electricity were slightly reduced. The report states that the Committee appointed for the purpose will consider it its duty to carefully watch the working of the new London Electricity Acts. The "standard prices" are not necessarily permanent and, apart from the general financial result, attention will be directed to several other features of the Acts, for instance, that which permits the companies to charge different rates to large and small consumers.

In presenting the report, the Council says that, as was pointed out last year, new factories in the war zones are being equipped with the most up-to-date appliances, and it is essential that a forward policy in this matter should be followed by manufacturers here and that the trade unions should abandon their opposition to all things new.

Cable Contract.—MESSRS. W. F. DENNIS & Co. inform us that the telephone cable about to be laid between England and Holland (ELEC. REV., April 23rd, p. 664, note entitled "The Telephone Service"), was manufactured by Felten and Guilleaume Carlswerk A.G. at Coln-Mulheim.

Industrial Retrospect and Prospect.—The Federation of British Industries says that there was a moderate increase in trade during the past quarter which was widely diffused, *i.e.*, not confined to the major industries. This is said to be due to a seasonal improvement and to the effects of the coal subsidy. The price curves show that a period of readjustment was in progress and the same conditions prevailed in other countries. American observers report a feeling of uncertainty and a probable slackening of activity. In Germany a state of serious trade depression still persisted, a condition which was partly due to the need for some further relative downward adjustment of the German cost of living and wages in order to bring them more into line with those in other countries. All indications point to the confirmation of the Federation's forecast that the current year was likely to be one of readjustment and consolidation rather than expansion.

Unemployment.—The total of registered unemployed fell to below a million during the week ended April 19th. The actual figure was 996,600, as compared with 1,024,389 on April 12th, and 1,202,670 on April 20th, 1928.

Municipal Trading at Sydney.—At a meeting in March, at which the Sydney City Council reaffirmed its intention of commencing the sale of electrical appliances, the acting general manager of the Electricity Department (Mr. Maling) said that he had received a demand from the Electrical Traders' Association, of which the Council was a member, for £15 15s. subscription and levy. In view of the fact that the Association is strenuously opposing the Council's trading proposals, it was decided to pay the amount demanded and withdraw from the Association.

Modified Mexican Import Duties.—The *Board of Trade Journal* for April 29th contained a list of articles which, by a recent Presidential Decree, are to be subject to modified duties upon importation into Mexico. Among these are electric stoves and heaters of all kinds. The new duties upon these are:—Weighing more than 20 kg. net each, 0.15 peso per kg.; weighing up to 20 kg. each, 0.30 peso per kg.

A Contractor's Hire-purchase System.—During the hearing of evidence by Parliamentary Committees upon clauses giving municipal supply authorities powers to wire houses and sell appliances by hire-purchase systems, a great deal has been said regarding the inability or unwillingness of contractors to do work by this method. Some contractors, on the other hand, have expressed their willingness to wire houses upon the deferred-payment plan, and a concrete case of the kind came under our notice when Mr. Harry Moss sent us the card which is reproduced herewith. We think the card is self-explanatory, but it will be noticed that it does not get over the difficulty of persuading those who are mere tenants to have their houses wired.

A Contractor's Hire-Purchase System.

Municipal Trading.—At the annual meeting of the Association of British Chambers of Commerce on April 22nd and 23rd, a resolution was passed strongly protesting against powers being granted to municipal authorities to trade in commodities in competition with ratepayers.

New Businesses Registered.—The following businesses have recently been registered under the Business Names Act:—

B. C. Palmer & Co. (electrical engineers), Cromwell House, High Holborn, W.C.

Victor Engineering & Supply Co. (electrical engineering), 118, Oxford Road, All Saints', Manchester.

"Isca" Electrical Engineering Co. (general electrical contracting and sales), 177, Sidwell Street, Exeter.

Eastern Wireless Co. (manufacturers of radio sets and accessories), 90, Three Colt Street, E.14.

James V. Coonan Co. (consulting mechanical and electrical and structural engineers), 8-9, Northwalls, Queen's Dock, Hull.

C. W. H. Electrical Co. (electrical, wireless, and general engineers), 53a, Standishgate, Wigan.

Peach, Martin & Co. (dealers in radio components and sets), 11, Carysfort Road, Stoke Newington, N.16.

Stockport Battery Service (accumulator makers and factors), Wellington Grove, Stockport.

Ludgate Radio Co. (dealers in radio and electrical goods), 56, Ludgate Hill, E.C.4.

Engineering Employés' Wages.—A conference of delegates of trade unions in the engineering industry was held in London on April 29th, when it was decided to recommend the members of the unions to vote in favour of a strike as a means of enforcing the demand for increased wages. It was also decided to approach the executive councils of unions with members engaged in power stations and other public utility undertakings to decide what action should be taken. A joint committee was instructed to set up a strike organisation, as it was considered certain that the ballot would result in a majority in favour of a stoppage of work.

Key Industry Duties.—As we briefly stated last week, carbons and scientific instruments are affected by the alterations proposed in the Key Industry Duties. The existing *ad valorem* duty on arc lamp carbons is to be replaced by a flat rate of 1s. per lb., while amorphous carbon electrodes are added to the list of protected goods with a duty of 33⅓ per cent. *ad valorem*. Galvanometers, electroscopes, gauges and measuring instruments of precision of the types used in engineering shops and viewing rooms, whether used in such or not, together with certain other instruments and their component parts, are still to be subject to a duty of 33⅓ per cent. *ad valorem*.

The duties are to remain in force until August 19th, 1936.

These regulations have been made as a result of the recommendations of the Board of Trade Committee, under the chairmanship of Sir Burton Chadwick, which was appointed to consider the matter.

Halifax Corporation and Contractors.—The Corporation Electricity Committee recommends that, as from May 1st, sales to customers of over £1 shall be invoiced, wherever possible, to the customer's electrical contractor, so that the contractor may be allowed the usual trade discount, provided that the Corporation retains a profit of not less than 10 per cent. If the customer has no contractor, or the contractor fails to send the order accompanied by cash, if cash is asked for, the sale will be direct to the customer at retail list price without deduction. In view of the above concession to contractors, the Committee says that it is unable to comply with a request for reduced rates for electricity used by contractors for demonstrative purposes, especially as the Corporation showrooms are available for demonstrations.

Trade Announcements.—The SCOTT INSULATED WIRE CO., LTD., has secured larger premises at 44, Queensland Road, Holloway, London, N.7 Telephone No.: "North 1706." All correspondence for the works should be addressed there. The head office remains at 69, Fleet Street, E.C.4, for the present.

MR. CLAUDE G. NAPP has acquired the business of the Wireless Instruments Co., of Harpur Street, Bedford.

After May 17th the address of MR. T. A. NUNWICH, representative of the Midland Electric Manufacturing Co., Ltd., for Lancashire will be 21, Clinning Road, Birkdale, Southport.

Catalogues and Lists.—THE METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester.—Special Publication 7200/6 containing particulars of the company's fabrics, papers, mica, bakelite, fibre and other insulating materials.

MESSRS. JOSHUA JONES & CO., LTD., 76, Worship Street, Finsbury, E.C.2.—A list of charges for varnishing paper.

THE I.L.G. ELECTRIC VENTILATING CO., 2850, N. Crawford Avenue, Chicago, Ill.—A booklet and leaflets advertising the company's electric fans and heaters.

THE ELECTRIC CONSTRUCTION CO., LTD., Ingersoll House, 9, Kingsway, W.C.2.—A brochure entitled "Modern Electrical Plant," containing over 60 pages of illustrations of the company's products, as well as data relating to cables, mechanical power transmission, &c.

MR. W. H. PETTIFOR, 11, Victoria Street, S.W.1.—A price list of electrical aids for the deaf, with pamphlets illustrating and describing various microphonic appliances.

THE STEAM FITTINGS CO., LTD., West Drayton, Middlesex.—An illustrated and priced pamphlet dealing with the company's dial thermometers.

THE BEKO LAMP CO., 5, Pocock Street, Blackfriars, S.E.1.—A price list of electric lamps.

MESSRS. T. HARDING CHURTON & CO., LTD., Atlas Works, Leeds.—Price lists of 25-cycle, three-phase induction motors including special crane patterns.

MESSRS. BAXENDALE & CO., LTD., Miller Street, Manchester.—A pocket catalogue of conduits and fittings, fuse boards, lampholders, switches, cables, and other electrical accessories and tools. Illustrated and priced.

THE RELAY AUTOMATIC TELEPHONE CO., LTD., Marconi House, Strand, W.C.—The "Relay Recorder" for May, advertising the company's automatic telephone system.

THE WESTMINSTER ELECTRICAL CO., 2, Tanswell Street, Lambeth, S.E.1.—A trade price list of electrical and radio materials and fittings.

MESSRS. J. J. EASTICK & SONS, Eelex House, 118, Bunhill Row, E.C.1.—An illustrated and priced pamphlet of radio apparatus.

Bankruptcy Proceedings.—CHARLES HUBBARD, 13, Magdalen Street, Norwich, electrician and wireless dealer.—The first meeting of creditors was held on April 23rd at the Official Receiver's Office, Norwich. The statement of affairs showed gross liabilities of £514, of which £472 was expected to rank against assets of £677, leaving a surplus of £205. Debtor did not admit that he was insolvent. It appeared that he commenced business on his own account in October, 1923, with about £300, his savings and stock which he had created in his spare time. The matter was left in the hands of the Official Receiver as trustee of the estate. The following are creditors:

	£		£
Bankers	105	Newbold & Co.	21
Hirst Bros. & Co., Ltd. ...	33	Siemens Bros. & Co., Ltd. ...	29
Houghtons, Ltd.	65	Stamp, S.	20

PETER JENNINGS, commercial traveller, Bury Road, Breightmet.—This debtor appeared at Bolton Bankruptcy Court on April 21st to undergo his first examination. His deficiency was £266. It was stated that since 1921 he had been employed as traveller for a firm specialising in electrical fittings and wireless goods. In 1924 he went to Ireland on behalf of a firm, and whilst there he was sent wireless goods of the value of £1,000. On leaving the service of the firm he was sued for an alleged deficiency of £35 in stock. Judgment was given against him, and with costs he had to pay £53. Debtor attributed failure to heavy business and domestic expenses. The examination was closed.

GASTON O. BONNET-PIERROT, electrical contractor and engineer, 2a, Camden Road, N.W.—This debtor attended before Mr. Registrar Mellor at the London Bankruptcy Court last week, in custody, for public examination upon accounts showing liabilities of £2,796 and assets of £5, apart from bad book debts, £485. Questioned by the Official Receiver, debtor said he commenced business in February, 1923, with a capital of £200, and a year later he began to deal in radio accessories, but owing to trade depression the business was not successful. In January last he was sentenced at the London Sessions to 15 months' imprisonment for obtaining wireless headphones with intent to defraud. The examination was concluded. The following are the principal creditors (unsecured):—

	£		£
Lee, Albert, & Co. (1923), Ltd.	278	Brown, S. G., Ltd	350
Stokes, C.	170	Fellows Magneto, Ltd.	80
Renaults, Ltd.	145	Brown Bros., Ltd.	36
Stevens, A. J., & Co. (1914), Ltd.	729	Bransome, Kent & Co., Ltd. ...	42
Burndept, Ltd.	130	Electrical Supplies, Ltd.	20
Clarke, N., & Co., Ltd.	168	Hunt, A. H., Ltd.	93
Formo Co., Ltd.	179	Edison Swan Electric Co., Ltd.	104
Metropolitan-Vickers Electrical Co., Ltd.	39	Radio Instruments, Ltd. ...	21
Coleman Bros. & Stone, Ltd. ...	45	Dew, A. J., & Co., Ltd. ...	50
		North Met. E.P.S. Co.	20

D. E. DAVIES, wireless engineer, 19, Poulton Street, Kirkham.—Receiving order made April 27th on debtor's own petition.

F. V. LAMBERT (Lambert & Curley), electrical contractor, 27, Parrock Street, Gravesend.—Receiving order made April 26th on debtor's own petition. First meeting, May 7th, at the Official Receiver's office, 280a, High Street, Rochester. Public examination, May 10th, at the County Court House, Rochester.

G. TURNER (Radio Supply Co.), electrician and wireless dealer, 34, Mesnes Street, Wigan.—Receiving order made April 27th on debtor's own petition.

W. G. HEAD, electrical engineer, late of 30a, High Street, Ashford.—Trustee, Mr. A. H. Ward, Official Receiver, 10, Burgate Street, Canterbury, released April 23rd.

A. WOOD, electrical agent, 67, Bradford Avenue, Cleethorpes.—Trustee, Mr J. F. Wintringham, Official Receiver, St. Mary's Chambers, Great Grimsby, released April 23rd.

J. A. REFOY (Varley Radio Co.), dealer in wireless apparatus, 178, Ancona Road, Plumstead, S.E.—First and final dividend of 5¾d. in the £, payable May 17th at the Official Receiver's office, 29, Russell Square, W.C.

F. F. GREGORY, electrical engineer, 2a, Westbourne Road, Luton.—Receiving order made April 24th, on debtor's own petition.

J. A. TREND, electrician, 31, Chapel Street, Luton.—Receiving order made April 24th, on debtor's own petition.

J. REGG and F. STEAD (Regg & Stead), radio engineers, 17, Old Chapel Street, Blackburn.—Last day for proofs for dividend, May 11th. Trustee, Mr. H. Parker, Official Receiver, 11, Winckley Square, Preston.

Company Liquidations.—H. E. DAVIS, LTD., 4, South Street, E.C., wireless and electrical manufacturers and agents.—Winding up voluntarily. Liquidator, Mr. R. S. Yates, Abbey House, 2, Victoria Street, S.W.1. A meeting of creditors was held on April 29th, at the Institute of Chartered Accountants, E.C., when the chair was occupied by the liquidator. A statement of affairs was presented which disclosed liabilities of £3,718, all due to unsecured creditors. There were debentures for £2,000, and it was stated that there was a further claim for £1,020 in respect of which an action was pending and against which the company was counterclaiming for a greater sum by way of damages. The liquidator said that the action was in respect of a number of dry batteries which had become unsaleable. The net assets were valued at £2,614, but from that amount had to be deducted £2,000 due to the debenture holder, which left £614, or a deficiency of £3,104. The company held £500 in debentures and £300 in shares in another company. The goodwill was put at £585. Those items had been shown on the statement of affairs, but were considered of no value. The company was incorporated in November, 1924, to take over as a going concern the business of electrical engineers which had been carried on by Mr. H. E. Davis. The consideration was £3,000 to be satisfied by £1,000 worth of shares and £2,000 worth of debentures. The liquidator said that the debenture holder had appointed Mr. William Osborne, of Balfour House, Finsbury Pavement, E.C., as receiver, and he was at the present time in possession of the whole of the assets. Mr. Yates said that he had seen the receiver and had obtained from him an undertaking that in realising the assets he would have due regard to the creditors' rights in the matter. He said that from the time of the incorporation there had been a loss on trading of £1,853. There was a petition on the file for compulsory liquidation. Mr. Baker (Wholesale Traders' Association) said that he considered that Mr. Davis, the debenture holder, should come forward and make the creditors some offer of composition. The meeting was then adjourned for that purpose. The following are creditors:—

	£		£
Igranic Electric Co., Ltd.	39	Hirst Bros. & Co., Ltd.	76
Discamusements, Ltd.	472	Duiker, J.	38
Wireless Components Co.	52	S.D.H. Manufacturing Co.	43

Burndept, Ltd.	118	Cochrane & Cripwell	200
		Bankers	203

R. MCKELLEN & CO., LTD., wireless, &c., dealers, 58, High Street, W.C.—The first meetings of the creditors and shareholders were held on April 23rd, at Carey Street, a compulsory winding up order having been made on March 30th. The Official Receiver reported that the company was registered as a private company on May 7th, 1925, with a nominal capital of £10,000, to carry on a business which had previously been conducted by R. McKellen. The liabilities were said to amount to about £7,200, of which nearly £7,000 was owing to a Mr. Matthews. The assets comprised cash £15, stock, fittings and furniture £200, and book debts payable by instalments, £7,000. A difference of opinion arose regarding the appointment of a liquidator and it was intimated that the matter would be referred to the Court.

DUBLIN AND LUCAN ELECTRIC RAILWAY CO.—Mr. David McDowall Grosart, Conyngham Road, Dublin, has been appointed by Mr. Justice Johnston to be Official Liquidator of the company.

REFLEX RADIO CO., LTD.—A petition for the winding up of this company has been presented to the High Court by Watson Jones, Ltd., electrical and wireless factors, 235a, Blackfriars Road, S.E., and will be heard in London on May 11th.

FULLER'S UNITED ELECTRIC WORKS, LTD.—A petition for the winding up of this company has been presented to the High Court by Mr. R. H. Symonds, iron and steel merchant, of Albany Buildings, 39, Victoria Street, S.W., creditor, and will be heard in London on May 11th.

WESTERN ANGLO-SWEDISH ELECTRIC WELDING CO., LTD.—A meeting of creditors was called for May 1st at 24, Wood Wharf, Greenwich. Liquidator, Mr. W. N. Tomkinson.

MORGAN & TAYLOR'S RADIO ELECTRIC CO., LTD.—A meeting of members is called for May 31st at 31, Queen Street, Cardiff, to hear an account of the winding up from the liquidator, Mr. S. E. Clutterbuck.

BRITISH ELECTRIC VEHICLES, LTD.—Winding up order made by the High Court on April 27th.

BURY ELECTRICAL PLANT CO., LTD.—A meeting of members is called for May 28th at the offices of Messrs. C. R. Scholes and Co., Silver Street Chambers, Bury, to hear an account of the winding up from the Liquidator, Mr. T. S. Smith.

CHASE ELECTRICAL MFG. CO., LTD.—A meeting of members is called for May 28th, at the offices of Messrs. Corfield and Cripwell, Balfour House, Finsbury Pavement, E.C., to hear an account of the winding up from the Liquidator, Mr. W. A. J. Osborne.

Dissolutions of Partnership.—PRATT & CO., electrical engineers and magneto specialists, 26, Little Clarendon Street, Oxford.—Messrs. H. B. Pratt and A. E. Malins have dissolved partnership so far as concerns Mr. H. B. Pratt.

FARROWOOD ACCUMULATOR CO., electrical and radio engineers, 69, Mumps, Oldham.—Mr. C. H. Wood and Mr. J. C. Farrow have dissolved partnership. Mr. Wood will attend to debts.

ELECTRIC REGULATOR & HEATING CO., manufacturing electrical engineers, Mikado Works, 8, Whittall Street, Birmingham.—Mr. J. E. Horsburgh and Mr. R. Roberts have dissolved partnership.

WORSTER & HOUNSLOW, electrical and wireless engineers, 40, Lowlands Road, Harrow, and 12, Albany Street, N.W.—Mr. A. E. Hounslow and Mr. G. H. Worster have dissolved partnership. Mr. Worster will attend to debts and continue the business.

ROYAL ACCUMULATOR CO., electrical accumulator manufacturers, 18, Atkinson Street, Deansgate, Manchester.—Mr. W. E. Beardsall and Mr. W. Johnson have dissolved partnership.

Copper and Lead Prices.—Messrs. F. Smith & Co. report May 4th:—Copper (electrolytic) bars, £65, 10s. decrease; do. do. sheets, no change; do. do. wire rods, £75, 10s. decrease; do. do. h.c. wire, 9 7/16d., 1/16d. decrease.

Messrs. James & Shakespeare report May 4th:—Copper bars (best selected), sheet and rod, no change; English pig lead, £29 15s., 10s. decrease.

Messrs. Edward Till & Co. report May 4th:—India-rubber, Para fine, 2s., 1d. increase.

New Italian Companies.—Among the concerns recently organised in connection with the Italian electrical engineering industry are the Società F.A.U.S.T., Fabbrica Apparechi Utilita Speciali Termoelettrica, Milan, capital 30,000 lire; La Società Elettrotermica, Milan, capital 50,000 lire; and La Società Costruzioni Elettriche Telefoniche, Milan, capital 50,000 lire.

Chinese Notes.—The *Chinese Economic Bulletin* says that the Ta Yu Li Electric Light Co., Hangchow, has become one of the most prosperous industrial concerns in the Chekiang Province, and its growth has been accompanied by the establishment of about a dozen companies to supply fittings, &c. These companies have organised an association to fix prices and prevent unfair competition, and they supply goods to a number of neighbouring districts.

The Industrial Commissioner of Kiangsu is taking steps to establish connections between the Nanking Electric Light Co. and the Pukow Electric Power Co.

Through telephone communication was established in January between the Shanghai Chinese City and the foreign settlements.

It is reported that tests of the new radio station at Paotow, for communication with Peking, have been quite successful.

Hostilities in the district have held up the installation of the telephone system between Tientsin and Shanghai, a contract for which was secured by a French firm last year.

Local Exhibitions.—MORECAMBE.—In connection with the extensive exhibition promoted by the Morecambe Chamber of Trade which closed on April 28th, a big display was organised by Mr. J. Boyce, the borough electrical engineer. During the progress of the exhibition, lectures, demonstrations and kinema films all appertaining to the use of electricity in the home were given. A notable feature of the exhibition was that it was a traders' exhibition and a large portion of the space was taken up by the Corporation electricity and gas departments, which work quite amicably together, and, as far as possible, act in unison in carrying out extensions and distribution work. The supply system has recently been changed over to a.c., 3-phase, and new reduced rates were instituted on April 1st. Over 2,000 consumers have been connected since the introduction of the new supply, most of whom have taken up the rateable value scale—20 per cent. rateable value plus 1d. per kWh. In organising the display Mr. Boyce had the assistance of several well-known firms.

DEWSBURY.—A British and Empire Goods Shopping Week commenced at Dewsbury on May 1st. The Corporation Electricity Department established a temporary showroom for the week in the Market Place, making an attractive display of British-made electrical appliances for domestic cooking, heating, washing, &c.

New Australian Companies.—Electric Home Lighting, Ltd., has been formed in Sydney with a capital of £10,000, to carry on an existing business of manufacturers and vendors of power plant, electrical appliances, and machinery.

The State Electric Lighting, Ltd., was recently registered in Sydney, with a capital of £25,000, to carry on the business indicated by its title.

United States Electrical Exports.—*Commerce Reports* states that exports of electrical goods from the United States during February last were valued at $6,862,910, an increase of $1,862,597 over the February, 1925, total, but a decline of about $280,000 as compared with the January figure. Upon the whole, there was an increase in the shipments of generating equipment, the most notable rise occurring in the case of a.c. generators of 2,000 kVA or over. There was a decrease in the exports of d.c. generators owing to a heavy decline in the smaller sizes. There was an increase in the transmission and distribution apparatus class and in motors, except for a slight decrease in the case of railway motors. Other

classes which recorded increases were radio apparatus, domestic appliances, batteries, fans, and wiring accessories. On the other hand, insulated copper wire and cable exports showed a decrease.

Book Notices.—Two recently revised publications of "Technical Pamphlets for Workmen," issued by the Post Office Engineering Department, "Telephone Testing Equipment" and "Automatic Telephony: Step by Step Systems," are on sale at H.M. Stationery Office, price 6d. each net.

The Macintosh Cable Co., Ltd., has sent us an instructional book which it has issued for the assistance of wiremen when employed on the Macintosh surface-wiring system. It is fully illustrated and contains notes of a practical nature which should prove of value to the wireman. A feature is a cloth sheet of wiring diagrams. A cloth cover of suitable dimensions will allow rough pocket usage. The company has also issued a brochure describing the wiring system.

"The Annual Report and Accounts of the British Legion, 1925." (103 pp.). London: The British Legion.—This report records the continuance of the good work carried out by the organisation for ex-Servicemen for a number of years, and shows that there is still ample scope for its benevolent and social activities.

"Signal Wiring," by T. Croft. Pp. xii + 349; 463 figs. Price 15s.; "Introductory Electrodynamics for Engineers," by E. Bennett and H. M. Crothers. Pp. ix + 665; figs. 306. Price, 22s. 6d. London: McGraw-Hill Publishing Co., Ltd.

"Dictionary of Costing," by R. J. H. Ryall. Pp. xi + 377. London: Sir Isaac Pitman & Son, Ltd. Price 10s. 6d. net.

"Science Abstracts (A and B)." Vol. XXXIX. Part 4. April 25th, 1926. London: E. and F. N. Spon, Ltd. Price 3s. each.

Handbook Series of the U.S.A. Bureau of Standards, No. 6, "Safety Rules for the Installation and Maintenance of Electrical Supply Stations." Price 10 cents.—The contents of this publication comprise Part I and the "grounding" rules of the 4th edition of the "National Electrical Safety Code." The American protection recommendations for all classes of electrical machinery and apparatus used on supply undertakings are given.

Germany's Foreign Electrical Trade.—An American Trade Commissioner at Berlin informs *Commerce Reports* that important German electrical manufacturers report an increase of 30 per cent. in orders on hand at January 1st, 1926, as compared with a year ago, and admit an increase in workers of 150 per cent. during 1925 as compared with 1924. All large companies paid 6 per cent. or 7 per cent. dividends, and undoubtedly placed considerable earnings to reserves. The tonnage of imports increased 270 per cent., and the value at practically the same rate. A comparison of the import and export figures shows that Germany shipped 19½ times as many tons of electrical equipment as it imported, and that the equipment exported was 16 times as valuable as the equipment imported.

For Sale.—The Chief Superintendent, Southern Railway, invites offers for surplus machinery, including fans, lathe, oil separator, &c. (See our advertisement pages to-day.)

The Institute of Patentees.—The address of the Institute of Patentees (Inc.) has been changed to 39, Victoria Street, London, S.W.1.

Lighting and Power Notes.

Argentina.—Hydro-Electric Development.—A new hydro-electric station is to be erected at Andalgala, in the Province of Catamarca, to supply electricity to the government-operated mines and smelter and for domestic and industrial use.—*Reuter's Trade Service* (Catamarca)

The extensions at the Sorrento power station of the Société d'Electricité de Rosario have now been practically completed. The new plant comprises four boilers and a 15,000-kW turbo generator. During the past year the sales of electricity increased from 37,636,131 to 39,243,905 kWh.

Bury (Lancs.).—Electricity Charges.—The Corporation Electricity Committee has fixed the following charges for electricity:—Domestic tariff: 14 per cent., on the rateable value, plus 1½d. per kWh for the first 200 kWh per annum, and ¾d. for the remainder, with a minimum standing charge of 30s. per annum and a maximum standing charge of £4 5s. House lighting: 4½d. per kWh. Heating: 1d. per kWh. Shop lighting: 5d. per kWh. Shops with occupied houses, first 200 kWh, 4½d. per kWh, beyond, 5d.

Blagdon.—Electricity Supply.—At a recent meeting of residents a resolution in favour of the introduction of electric light was adopted. The North Somerset Electric Supply Co., will erect h.p. mains through the centre of the village and supply a ¾-mile radius. The price to be charged is 9d. per kWh.

Canada.—Hydro-Electric Development.—During the next eight months approximately $2,000,000 will be expended by the Winnipeg Electric Railway Co. and its subsidiaries in making the necessary provision to obtain and utilise additional power from the hydro-electric plant at Great Falls. In connection with the development at Grand Falls, tenders are now being prepared and contracts will shortly be awarded.

One of the principal proposals in the Ontario Government estimates is an item for $3,000,000 for the construction of a 110,000-V transmission line through the eastern district.

It is stated that the Shawinigan Water and Power Co. group and the Aluminium Corporation of America interests have purchased from the Duke and Price estates respectively their interests in the Duke-Price Power Co. This company installed plant at Maligne, on the Saguenay River, and brought into operation 360,000 h.p. last year. An extension to 480,000 h.p. is proceeding, and is expected to be completed shortly. The Aluminium Corporation of America at Caron Chute has plans for an ultimate development of 800,000 h.p.

Continental.—Italy.—The estimated electrical energy available at the end of 1925 was 3,200,000 h.p., being more than double that of pre-war years and an increase of 300,000 h.p. for each of the past two years.—*Reuter's Trade Service* (Milan).

Sicily.—In a recent issue of *Energia Elettrica*, details are given of the hydro-electric plant which has lately been completed in Sicily to utilise the water power of the River Belice. About 7½ miles from Palermo, at a height above sea level of nearly 2,000 ft., a dam 128 ft. high and 850 ft. in length has been constructed to form an artificial lake with a storage capacity of 16,720 million gallons. From the lake, the water is led along a 7½-mile canal to an 11-million gallon storage reservoir. From this the water is conveyed to the generating station by means of a pipe 265 ft. in length. The water reaches the power station under a head of 1,550 ft. The plant comprises four Riva-Monneret turbines, each developing 3,500 h.p. at 750 r.p.m., these being coupled to 10,500-V alternators. The output is expected to amount to 25 million kWh per annum.

Belgium.—Work has recently been commenced by the Société d'Electricité de la Région de Malmedy on the erection of three hydro-electric stations to utilise the water power of the River Warchi.

France.—Work is well in hand on the construction of a new central power station which will have a capacity of 28,000 h.p. at Monistrol d'Allier for the Compagnie Electrique de la Loire et du Centre. The plant is expected to be ready for operation before the end of the current year.

Bulgaria.—Although it is estimated that water power to the extent of over one million h.p. is available in Bulgaria, very few hydro-electric plants have so far been erected in the country. The most important plants at present in course of construction are those on the Rivers Rila and Kritschin. The Rila installation will comprise three power stations at Rila, Pastra and Ilina. So far the only station to be completed is that at Pastra, where eight 3,300-h.p. turbo generators have been installed. The energy is stepped up to 35,000 V for transmission to Rila, Crerka, Pernik and Batanova.

Coventry.—Loan.—The Corporation is making application for sanction to a loan of £14,321 in connection with the supply of electricity to the Radford housing estate.

Deal and Walmer.—Electricity Supply.—The local authorities have been informed that in order to meet with the demand for a supply of electricity in the two towns, the South-East Kent Electric Power Co., Ltd., is arranging with Messrs. Pearson & Dorman Long, Ltd., for a bulk supply from Betteshanger Colliery, and it is proposed that electricity shall be transmitted by means of overhead cables to sub-stations, from which it will be distributed by underground cables in Deal and Walmer.

Eastbourne. — Loan Sanctioned. — The Electricity Committee has received sanction to a loan of £16,000 for mains and services.

Glasgow.—Progress during March.—The Corporation electricity manager reports that during March 159 houses were wired bringing the total to date to 2,122. There were 164 applications for hire of appliances, making the total since the scheme commenced 10,281. He has suggested that arrangements might be made for occupiers of small houses to pay the cost of the more expensive domestic appliances by monthly instalments, and the Sub-Committee on Propaganda has recommended that the proposal be adopted.

Hitchin.—Electricity Supply.—The Rural District Council has decided to raise no objection to the Stevenage Electric Light and Power Co., Ltd., extending the mains to supply Council houses at Knebworth and Mile End. The company will provide services and fittings for two lighting points per house at 1s. per week if all the tenants are prepared to take a supply, three points at 1s. 6d. per week, and any additional point at 2d. each per week, plus the charge for electricity consumed.

Huddersfield.—Loans.—The Electricity Committee has decided to apply for sanction to borrow £10,000 for transformers and £20,000 for mains.

Ilford.—Electricity in Bulk.—The Electricity Committee has approved the draft provisional agreement between the County of London Electric Supply Co., Ltd., and the Council regarding the proposed bulk supply of electricity by the Company to the Council.

Loan Sanctioned.—The Committee has received sanction to the borrowing of £5,000 for domestic apparatus to be let on hire.

Sub-Stations.—The Committee has recommended that three sub-stations be converted into automatic sub-stations and tenders for the necessary apparatus are to be obtained.

India.—RANGOON (BURMA).—Owing to the increased demand for electricity the Rangoon Electric Tramway and Supply Co., Ltd., has recently installed additional plant. A 3,000-kW set has been erected and a new 6,600-V switchboard has been completed. Two 500-kW rotary converters have been installed in Turtle Tanks sub-station to take the tramway load in the east part of the city, and a considerable portion of the h.p. transmission system in the city and the suburbs has been changed over from 2,300 V to 6,600 V.

ELECTRICAL DEVELOPMENT.—Messrs. Martin & Co., of Calcutta, are promoting two new electrical enterprises, known as the Jubbulpore Electric Supply Co. and the Muttra Electric Supply Co., for the purpose of supplying electrical energy to the cities of Jubbulpore and Muttra respectively. Arrangements have been made with the military authorities, municipalities, and the railway companies at these places for the supply of electricity. The plant required for the Jubbulpore company consists of two 175-kW and one 300-kW alternators, with switchgear, &c., 7¼ miles of h.p. feeders, and 15 miles of distributing mains, with street lighting, at a cost of Rs. 7 lacs. Additional plant will be also provided in the second and third year. For the Muttra Electric Supply Co. the initial plant consists of two 175-kW and one 50-kW alternators, with accessories, three miles of h.p. feeders, and 10 miles of distributing cables, with street lighting, &c., at a cost of about Rs. 5 lacs.

The Government of Madras states that hydro-electric schemes to be undertaken during the next five years are as follows:—(1) The Pykara scheme, with a capacity of 37,200 kW, which may ultimately be connected with the Moyar scheme, which will yield another 10,500 kW. (2) The Pinjikavi scheme, with a Kumbar connection, to develop about 18,000 kW. (3) The Papanasam scheme to develop about 21,000 kW. The estimated cost for the Pykara Fall development, which is expected to be completed in 2½ years, is Rs. 238 lacs.

Leek.—INAUGURATION OF EXTENSIONS.—Plant extensions, including a 400-kW gas-driven generating set, were formally inaugurated at the Urban District Council's electricity works on April 28th.

Lichfield.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £1,200 for the provision of an overhead line to Whittington Barracks.

Manchester.—NEW PLANT.—The Electricity Committee is to ask the City Council at an early meeting to approve a scheme for works extensions, at a cost of £600,000, and for equipment at £234,000. The engineer, Mr. H. C. Lamb, states that unless arrangements are made to meet the demand for the winter 1928-29, there will be a serious danger of shortage of plant. He proposes a second power house containing two sets of 40,000 kW each. Only one set is required for the present extension. The boilers will be fitted for the use of coal or coke breeze, although the new boiler-house will be designed for the use of pulverised fuel if the plant on order is a success.

Morecambe.—ELECTRICITY CHARGES.—The Town Council has introduced a new scale of electricity charges, which includes as alternatives to the flat rate, a rateable value charge, maximum demand charge, two-rate scale, and a shop-window rate.

North Wales and South Cheshire Joint Electricity Authority.—Details were given at the annual meeting of the North Wales and South Cheshire Joint Electricity Authority held recently at Llandudno of the progress made in connection with the supply of electricity in bulk in the authority's area. The bulk supply of electricity has increased from 8,500,000 kWh in 1922 to 19,500,000 kWh in 1925. In October, 1923, the lines constructed were 111 miles in length, and since that time 260 miles of line has been constructed. The lines extend from Pwllheli in the west to Runcorn in the east. Lines are being constructed to the engineering works at Sandbach and to the borders of Staffordshire. Since 1923 the plant has been increased by 10,000 kW. A comprehensive report of the progress of the erection of the transmission lines was presented by the North Wales Power Company, which shows that nearly 105 lines have been erected and the new dam at Maentwrog is almost completed. It is reported that owing to the nature of some of the foundations exposed for the Gyfynys Hendre, Mur and Trawsfynydd Dams, the designs have had to be modified. The work is now proceeding and good progress is being made.

Preston-Blackpool.—TRANSMISSION LINE.—Owing to the Preston-Blackpool transmission line having to cross the River Ribble opposite the Preston power station, it will be necessary to lay the cables underground, at an increased cost of about £2,000. The Electricity Commissioners have advised the Preston Electricity Committee that, in order to provide for eventual duplication of this line, it should arrange for the towers, which are to be erected under the first part of the scheme, to be so designed as to enable a second set of three conductors to be added later.

South Africa.—WITBANK POWER STATION.—According to the Johannesburg correspondent of the *Financial Times*, the first 20,000 kWh set at the new Witbank station of the Victoria Falls and Transvaal Power Supply Co., has recently been started up This is the only one at present installed of the three sets proposed. The electricity is being transmitted at 132,000 V to Brakpan, where it will be transformed down to 20,000 V for distribution along the Rand. The transmission line, 65 miles in length, is supported by 100 ft. towers, with spans of 1,000 ft. between them.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—The Silsden Urban District Council, for the supply of electricity in the urban district; and the Cark and District Electricity Co., Ltd., to supply in parts of the rural district of Ulverston. The Gwynedd Trust, Ltd., has applied for the amendment of the Whitchurch, Ellesmere and District Electricity Order so as to include the rural district of Malpas in addition to the areas already mentioned in the Order.

The Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Gainsborough Urban District Council to supply electricity in the urban district, and the Millom Urban District Council in the urban district of Millom.

Stirling. — LOANS. — The Town Council has applied for sanction to a loan of £4,000 for mains extensions to supply the Bannockburn Road Housing site, and £3,000 for laying cable for houses, of the Scottish Oil Agency, Ltd., and the London & North-Eastern Railway Co.

Turkey.—ELECTRICAL DEVELOPMENT.—The report of the Société Turque d'Electricité shows that the output of the power station during the past year amounted to 45,825,860 kWh, an increase of 14½ per cent. over 1924. An agreement has been concluded with the Société du Gaz de Kadikeny, to supply electricity to the Asiatic side of the Bosphorus, and in order to provide the additional supply an order has been placed for a new turbo-generator with a capacity of 15,000 kW.

United States.—HYDRO-ELECTRIC DEVELOPMENT.—According to the *Electrical World*, Col. H. L. Cooper has presented to the New York State Water Power Commission an amended application of the St. Lawrence Valley Power Corporation, in which the Frontier Corporation is interested, for a permit to develop 2,400,000 h.p. at Hawkins Point at the foot of Barnhart Island in the St. Lawrence River, 43 miles north-east of Ogdensburg. Detailed plans filed with the Commission show that the Company contemplates the erection of a generating plant of 24 units, each capable of developing 50,000 h.p., on both the American and Canadian sides of the river. It is proposed to build a dam, which would be 130 ft. in height, giving a head of 83 ft. It is proposed to maintain the water level at 246 ft. above sea level, which is virtually the level of Lake Ontario. The total cost of the scheme is estimated at $238,000,000.

Yorkshire.—COLLIERY LINKING-UP SCHEME.—A 33,000-V cable is being laid, to link up the collieries included in the Doncaster Collieries Association. By this means these collieries will be able to pool their surplus electricity, which is mainly generated from waste heat. The laying of the cable is well advanced, and the collieries will be linked up in the course of a month or two.

Tramway and Railway Notes.

Birmingham.—TRAMWAY EXTENSIONS.—Important extensions are to be made to the Corporation tramway system. The chief extensions are from the suburb of Hall Green to Shirley, at the city boundary; and on the Tyburn Road, Erdington, along a new road to be constructed, near to Pype Hayes Park.

Glasgow.—NEW TRAMCAR DESIGN.—In its efforts to compete with the motor-'buses, the Corporation is building a Pullman tramcar, which will be a single decker and practically all steel. It will be capable of a speed of from 20 to 30 miles an hour, and will have upholstered seats, small foyers for "straphangers," and a seat for the driver. If the experiment is successful 50 more cars will be built.

Kilmarnock.—ABANDONMENT OF TRAMWAY.—The Corporation has applied for an Order authorising it to abandon its tramway as, owing to the increased working costs, it is not now possible for the undertaking to be worked remuneratively.

London.—METROPOLITAN ELECTRIC TRAMWAYS.—As the result of an inspection of the whole of the Metropolitan Electric Tramways, made recently by the Ministry of Transport, the Company has now received official authority for an increase in the maximum speed of the tramcars from 16 m.p.h. to 20 m.p.h. In certain parts of the system the present authorised speed is lower than the maximum of 16 m.p.h., and in these instances also some further increase will be permitted.

"OVAL" TUBE STATION.—Good progress is being made with the construction of escalators at the tube station at Kennington Oval, and it was hoped to put them into operation on May 8th. The scheme of reconstruction at this station also provides for a new and more commodious booking hall and a new entrance leading to Harleyford Road.

BREAKDOWN.—There was delay on the Underground railway on the morning of April 27th, owing to an electrical defect on the north-bound tube between Waterloo and Charing Cross, which caused a diversion of the traffic during rush hours. Between Charing Cross and Piccadilly services had to be suspended, but were restored after a delay of about two hours.

Worcester.—Tramway Improvements.—In connection with the tramway undertaking which was recently purchased by the Corporation, a recommendation in favour of railless cars has been approved, and the following works are to be carried out:—Fourteen new cars, £22,400; taking up tramway track and repairing roadways, £12,000; adaptation of overhead work, £3,000.

Telegraph and Telephone Notes.

Cuba.—New Radio Station.—Cuba will shortly possess another radio-telegraph and telephone station, permission having been given by the Government for the construction of the buildings. The station will be sufficiently powerful to communicate with stations belonging to the United Fruit Co. Communication will also be possible with North, South, and Central America and the West Indies; the contract calls for the station being opened in any case by the end of 1930.—*Reuter's Trade Service* (Habana).

Danzig.—New Radio Station.—A new radio station is being built by the Deutsche Telefunken Gesellschaft at Glettkau, in the Free City of Danzig, for the Danzig Government. It is expected to furnish communication with the rest of Europe.

Germany.—New Cable Steamer.—A new cable-laying steamer was recently launched by the Blohm & Voss Co., of Hamburg, for the North German Sea Cable Works, of Nordenheim, Germany. The vessel, which is 459 ft. in length, has been designed for use both as a cable-laying and freight-carrying steamer, it having a displacement of 14,550 tons and a cable-carrying capacity of 8,000 tons. It is being used for the laying of the final portion of the new telephone cable between Holland and England, and when this is completed it will lay a new telegraph cable between Emden and the Azores.

Honduras.—Radio Letter Service.—The Tropical Radio-Telegraph Co., of Honduras, recently introduced a service of week-end wireless letters between Tegucigalpa and the United States and Canada. The rate per word is 0.15 peso (gold), with a minimum of 20 words. Wireless letters are accepted at the main office up to midnight on Saturday and delivered at their destination on the following Monday morning. The minimum price is 3 pesos, and the language employed must be either that of the country of origin (Spanish) or destination. Code telegrams are not accepted.—*Reuter's Trade Service* (Tegucigalpa).

Haiti.—New Radio Station.—The Government of Haiti has granted permission and the necessary funds for the construction of a new radio-telegraph station at some point not yet chosen.—*Reuter's Trade Service* (Port-au-Prince).

Spain.—Telephone Developments.—The National Telephone Co. of Spain is laying underground cables throughout the country and introducing the automatic service and other improvements. Among the main features of the programme are a number of trunk lines between the larger towns. The automatic service has been completed at Santander, a new telephone exchange erected, and a school established for the training of the telephone staff. The new cables in most of the northern and north-western districts will in all probability be completed before the end of the year.

Transatlantic Telephony.—Rugby Experiments.—It is understood that interesting transatlantic radio-telephony tests are to be carried out at the Rugby station shortly. According to the *T. & T. Age*, speech is to be transmitted in an extremely distorted form, in which state it will be completely unintelligible to the ordinary listener. The receiving apparatus in America will filter out the distortion and restore the speech to its original clarity. The filtering device is too costly and complicated to allow of its general use for interception of the messages. Reception could be made still further difficult for unauthorised persons by rapidly varying the distortion, say several times per second, in order to compel the use of perfect synchronisation which is not too easy.

Costa Rica.—New Radio-Telegraph Station.—The new wireless station belonging to the International Radiograph Co., which has just been erected half way between Cartago and Paraiso high above sea level, has three steel towers 440 ft. high on cement foundations and 1,050 ft. apart; the receiving station has two towers 140 ft. high standing 183 ft. apart. There is a separate electric plant, a residence for the employés, insulated oil storage, and very full general equipment. Messages are received from the United States, Europe, South America, other parts of the world, and ships at sea.—*Reuter's Trade Service* (San Jose).

Radio Notes.

Australia.—Government Control of Broadcasting.—It is reported that the Commonwealth Government is likely to take over the whole of the broadcasting operations in Australia shortly.—*Reuter* (Melbourne).

Belgium.—Wave-length.—From April 30th Radio Belgique's new wave-length will be 487 metres, and not 508 as was at first reported. The new station at Antwerp radiated a special concert on April 30th on a 265-m. wave.

Bolivia.—New Station.—The recently-organised Radio Club of La Paz has met with much success. According to the terms of its charter, the members will be asked to pay a small initial sum fixed by the directors, collectively sufficient to cover the original cost of the transmitting station. Within a few weeks broadcasting will commence.—*Reuter's Trade Service* (La Paz).

Broadcasting in England and America.—A Contrast.—Captain P. P. Eckersley (chief engineer of the British Broadcasting Co., Ltd.), speaking at the annual meeting of the British Science Guild in London, contrasted the system of joint ownership and management as applied by the B.B.C., with private enterprise in America. By amalgamation, he said, the B.B.C. had been able to build up a reputation greater than that of any other broadcasting concern in the world. More people listened to wireless programmes in this country, in relation to the population, than in any other country in the world, and more of the poor people were able to listen; in fact, the B.B.C. fulfilled a public service, and 90 per cent. of the people of the British Isles could listen to programmes on a set which need not cost more than two or three pounds. In America, however, those who found broadcasting of the greatest value (*i.e.*, those living in rural areas) had to reply on expensive sets, because it was only in the cities and towns, where the broadcasting companies were able to broadcast advertisements and so obtain revenue, that real service was given. In Great Britain the stations were erected primarily for the public, but in America the man who erected a broadcasting station did so, in the first place, in his own interests (in order to advertise goods) and afterwards for the public. The B.B.C. was not a trust, but a public service. He did not see why, because the principle of trade directorship of the organisation was to be discontinued and seven men who were absolutely independent of the Press, the trade, or any commercial enterprise, were to be appointed to the board, it should be said that broadcasting would be subject to Government control. If the report of the Broadcasting Committee were adopted by the Government, the B.B.C. would continue its activities in the same way as it had done hitherto. Unified control, and the application of scientific methods, had enabled the B.B.C. not only to serve all the country, but to put into operation methods which competitive organisations would never have been able to apply. For example, any great man's speech could be broadcast to every part of the British Isles, but that could not be done under the American system, because of disagreement between competitive organisations.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—Melbourne.—June 16th. City Council. Turbo-alternator, exciter, and condensing plant.*

Brisbane.—August 26th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator.*

Adwick-le-Street.—May 19th. Urban District Council H.p. switchgear and cables, step-down transformers, l.p. distribution gear, pillars, cables, joint boxes, &c. (April 16th.)

Belgium.—May 12th. Municipal authorities of Schaerbeek, Brussels. 600 armoured circuit breakers. Particulars (Cahier des Charges) from the Service de l'Electricité, Hotel de Ville, Schaerbeek.

Bristol.—May 13th. Electricity Department. One 7,000-kW turbo-alternator, with condensing plant and auxiliaries. (April 30th.)

Canada.—June 2nd. Department of Public Works. One 25-ton electrically-operated portal crane for Esquimalt Dry Dock.*

Cairo.—Egyptian State Railways, Telegraphs and Telephones. Underground cables. Chief Inspecting Engineer, Queen Anne's Chambers, Broadway, Westminster, S.W.1.—*Reuter's Trade Service* (Cairo).

Cheadle and Gatley.—May 10th. Urban District Council Electricity Department. Single-phase alternating-current meters required during year ending March 31st, 1927. Form of tender from Mr. R. W. Willis, engineer and manager, 37, High Street, Cheadle.

Dundee.—May 20th. Electricity Department. A.c. and d.c. house-service meters for 12 months. (See this issue.)

Farnworth. — May 14th. Electricity Department. cables, street-lighting pillars, pillars and boxes, cut-outs and meter boards, and meters. (April 30th.)

Hull.—May 20th. Electricity Department. Underground cables. (April 30th.)

Telephone Committee. Copper jointing sleeves. (See this issue.)

Ilford.—May 11th. Electricity Department. One 1,000-kW La Cour motor converter. (April 30th.)

India.—India Store Department. May 11th. One 200-kW La Cour-type motor converter. (April 23rd.)
May 14th. Three 5-kW oil engine-driven generator sets, one switchboard, and two pumping sets.*
May 15th. Madras and Southern Mahratta Railway Co., Ltd. Telephone line material (comprising porcelain insulators, galvanised terminal irons, &c.), copper line wire (1,302 miles), copper binders, tapes, &c. (April 23rd.)
May 18th. Porcelain insulator cups. (April 30th.)
June 15th. 70,000 copper bonds for track rails.*

Leeds.—May 15th. Library and Arts Committee. Electric lighting at Public Library, Hough Lane, Bramley. Particulars from Messrs. Foggitt & Addison, architects, 3, Park Place, Leeds.

London.—METROPOLITAN ASYLUMS BOARD.—May 19th. Installation of electric cable, &c., for arc-light treatment apparatus. (April 30th.)
PADDINGTON.—May 21st. Great Western Railway. Electric wire and cables. Specification from the Stores Superintendent, Swindon.

Manchester.—May 11th. Tramways Committee. Electric tramcar bodies, trucks, motors and controllers. Specifications from Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly, Manchester.
May 20th. Electricity Committee. Potential and current transformers, cable supplies, electric kettles, and electrical meters for 12 months. (See this issue.)

May 11th. Board of Guardians. Electric cables for the Crumpsall Institution. Particulars from E. Hargreaves, Superintendent of Works, Union Offices, All Saints, Manchester.

Middlesbrough.—Electricity Department. Extension of electricity supply distributors, total length approx. 1,000 yd. (April 30th.)

New Zealand.—AUCKLAND.—June 21st. Electric Power Board. L.p. insulators, &c.*
WELLINGTON.—May 12th. Post and Telegraph Department. 18 switchboards.*
Public Works Department. July 20th. Phase transformer for Mangahao electric power scheme.*
New Zealand Railway Department. June 16th. Electric motors.*
DUNEDIN.—May 28th. Otago Harbour Board. One portable electrically-driven cargo stacker.*

Nottingham.—May 31st. Board of Guardians. One 60-kW d.c. turbo-generator, &c., and alterations to main switchboard, &c. (April 16th.)

South Africa.—JOHANNESBURG.—Municipal Council. 8 miles h.p. cable, 41 miles l.p. cable.*
CAPE TOWN.—June 3rd. South African Railways and Harbours. One motor-starting panel.*
June 10th. D.c. electric generating plant (suction gas).*

Southern Rhodesia.—June 21st. Department of Posts and Telegraphs. Automatic telegraphs. Automatic telephone exchange for Salisbury. (April 23rd.)

Stockton-on-Tees.—May 10th. Electricity Department. Paper-insulated cables, a.c. meters, and house-service cut-outs. (April 30th.)

Walthamstow.—May 12th. Electricity Department. One 1,500-kW motor converter. (April 23rd.)

Warrington.—May 10th. Electricity Department. E.h.p. sub-station truck-type switchgear. (April 23rd.)

Waterford.—May 12th. Electricity Department. Two 250-kVA, 3-phase alternators direct coupled to heavy oil engines, e.h.p. mains and l.p. underground distribution system, transformer kiosks, pillars, street lighting services, l.p. overhead distribution system, &c. (April 9th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Aberdeen.—Electricity Committee. Accepted:—
10,000-kW turbo-alternator, with condensing plant (£38,000).—English Electric Co., Ltd.

Australia.—SYDNEY.—The following is the list published by the Sydney *Daily Telegraph* of the tenders submitted for the turbo-alternators for the Bunnerong station of the Sydney Municipal Council:—

Tenderer.	Total price after deducting spare parts.	Australian manufacture.
English Electric Co. of Australia, Ltd. ...	£492,351	—
Metropolitan-Vickers Electrical Co., Ltd. ...	502,500	—
Allgemeine Elektricitats Gesellschaft ...	503,550	—
C. A. Parsons & Co., Ltd.	552,307	—
Australian General Electric Co., Ltd. ...	565,117	35 per cent.
Ditto, alternative (recommended by the acting chief electrical engineer) ...	606,778	33 per cent.
English Electric Co. of Australia, Ltd. ...	619,173	96 per cent.
British General Electric Co., Ltd.	636,333	?
Commonwealth Shipping Board (with Metropolitan-Vickers). Accepted ...	**661,224**	**55 per cent.**
Ditto, alternative	685,386	63 per cent.
Schneider & Co.	682,656	—
Brown Boveri & Co., Ltd.	721,161	?
Sir W. G. Armstrong, Whitworth & Co., Ltd.	764,260	—

The figure of £666,605, at which the Commonwealth Shipping Board's tender has been accepted, includes a few extras that have been omitted in this schedule, in order to make the tenders comparable. Only machines running at 1,500 r.p.m. (the recommended speed) have been included.
At a special meeting of the Council held on March 22nd, the Town Clerk stated that the following cable message had been received from Mr. Mackay (general manager):—
"Yours eighteenth Bunnerong turbines: Council's decision obviously not based on commercial or technical considerations; therefore comment by me difficult. Commercially and technically 'B.T.-H.' (British Thomson-Houston) tender better. Even allowing for Council's desire to place order with local publicly-owned works, I think it imprudent order six turbines Cockatoo, because order too big for inexperienced establishment to complete in time. Failure to put Bunnerong into operation early 1928 would be a catastrophe. Dividing order between Cockatoo and 'B.T.-H.' would secure completion of some plant by 1928."

A later message from Mr. Mackay was as follows:—
"Further by cable to-day: Situation discussed with Payne, manager Cockatoo, and as result I recommend if six turbines ordered Cockatoo that special arrangement be made for early completion first two. Suggest Council agree to importation by Cockatoo increased percentage parts first two turbines on condition that percentage imported parts reduced last two."
After considerable discussion the Council, on a vote, declined to reconsider the decision to give the contract for turbo-alternators to the Commonwealth Shipping Board for construction at the Cockatoo Dockyard.
A further resolution was passed giving the city electrical engineer power to "negotiate" with the Commonwealth Shipping Board for the additional variation of the tender, on the lines indicated in the cablegrams of Mr. Forbes Mackay, to permit of additional units being imported from Britain, so as to ensure the delivery of the plant from Cockatoo in the time specified under the contract conditions.

Brighton.—Lighting Committee. Accepted:—
Switchboard (£848); duplicate cell regulating switches (£625).—Bertram Thomas.
Booster (£654).—Bruce Peebles & Co., Ltd.
Steam turbine-driven rotary feed pump (£355).—G. & J. Weir, Ltd.
3,000 yd. .1-in. cable (£570).—Standard Telephones & Cables, Ltd.

Chester.—Corporation. Accepted:—
New battery at the Crone Street electricity works (£13,660, less £1,466 for the scrap lead).—Tudor Accumulator Co., Ltd.

Coulsdon.—Housing Committee. Accepted:—
Wiring on housing estate (12s. 6d. per point).—G. S. Hawker, Ltd.

Croydon.—Electricity Committee. Recommended:—
Switchgear at Drummond Road sub-station (£761).—A. Reyrolle and Co., Ltd.
Two transformers for Drummond Road sub-station (£810).—British Electric Transformer Co., Ltd.

Dover.—Electricity Committee. Folkestone-Dover cable. Supply of 6,250 yd. .1 sq. in. 3-core paper-insulated cable, including laying, jointing, testing, &c., and the provision of all necessary boxes:—

Macintosh Cable Co., Ltd.	£4,755
Hackbridge Cable Co., Ltd. (Recommended.)	**4,413**
Watshams, Ltd.	4,290
Enfield Cable Works, Ltd.	4,782
W. T. Henley's Telegraph Works Co., Ltd.	4,804
Johnson & Phillips, Ltd.	4,825
Standard Telephones & Cables, Ltd.	4,803
Pirelli-General Cable Works, Ltd.	4,764
W. T. Glover & Co., Ltd.	4,815
Siemens Bros. & Co., Ltd.	4,684
British Insulated Cables, Ltd.	4,810
Callender's Cable & Construction Co., Ltd.	4,889

The Committee ruled out the third of the above tenders, which was for cable of Belgian manufacture.

Durham.—County Education Committee. Accepted:—
Electric light installations at Station Town School (£128), Simm and Richardson; at West Cornforth New School (£376), F. Reid Ferens and Co.

Erith.—Urban District Council. Accepted:—
Cable (£1,388).—Callender's Cable & Construction Co., Ltd.
Switch cubicle (£182).—Fraser & Chalmers Engineering Works.

Folkestone.—Town Council. Accepted:—
Electric light fittings for the Leas Cliff Hall (£540).—Metro-Vick Supplies, Ltd.

Halifax.—
Electrical work in connection with 40 Corporation houses at Nursery Lane and 40 houses at Booth Town.—A. Higginbotham & Sons.

Hornsey.—Electricity Committee. Recommended:—
Wiring 108 Council houses (£874).—E. Wright & Co.

London.—ISLINGTON.—Board of Guardians. Electric lighting installation (mains and power) for the Guardians' schools, Andover Row, Hornsey Road, N. Mr. Edmund J. Harrison, architect:—

Simplex Electric Lamp Co., Ltd.	£4,750
J. M. Jamieson	2,300
Dalziel Engineering Co.	2,020
Smethurst & Co.	1,818
McHow & Haynes	1,797
W. C. Clutton	1,600
Electrical Installations, Ltd.	1,567
E. H. Finn	1,427
Higginbotham & Co.	1,400
Ridout & Ratcliff	1,392
P. M. Braidwood	1,385
Ellis & Ward	1,349
Locke & Soares	1,310
G. A. Weston	1,308
Morris Electrical Co., Ltd. (Accepted.)	**1,225**

Lancaster.—Corporation. Accepted:—
E.h.p. cables.—British Insulated Cables, Ltd.

Lichfield.—Town Council. Accepted:—
Electricity meters for one year.—Measurement, Ltd.

Peterborough.—We are informed that the statement appearing in our last issue to the effect that the Town Council had accepted a tender of International Combustion, Ltd., for boiler plant at £34,190 is incorrect; that company did not tender.

Reigate.—Electricity Committee. Accepted:—
Supply and erection of a fly-wheel alternator for the new six-crank engine (£2,535).—Electric Construction Co., Ltd.

Rothesay.—Electricity Works. Accepted:—
One battery of 268 13-plate S.T.C.-type cells, capacity 600 amp.-hr.—Hart Accumulator Co., Ltd.

Salford.—Education Committee. Accepted:—
Electric lighting installation (£169).—County Electrical Co.

Tramways Committee. Accepted:—

Stores for 12 months:—
Commutator segments.—Manchester Armature Repair Co., Ltd.
Insulating tapes.—L. Andrew & Co.
Gear and pinion wheels.—British Hele-Shaw Patent Clutch Co., Ltd.
Steel tires.—Hadfields, Ltd.; Brown Bayley's Steel Works, Ltd.
Brake blocks.—Pease & Partners, Ltd.

Wanstead.—Essex Education Committee. Accepted:—
Installing electric light at Wanstead County High School (£699).—H. A. Neale & Co.

York.—Electricity Committee. Accepted:—
Cable (£8,050).—Callender's Cable & Construction Co., Ltd.

Forthcoming Events.

Junior Institution of Engineers.—Friday, May 7th. At 39, Victoria Street, S.W. At 7.30 p.m. Lecturette on "Distortion in Wireless Reception," by Mr. A. V. Balihatchet.
Friday, May 14th. Paper on "Static Transformer Testing and Test Plant Requirements," by Mr. L. Smith.

Electrical Association for Women.—Friday, May 7th. At the Criterion Restaurant, Piccadilly, W. At 1 p.m. Luncheon.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, May 8th. At Brecon. Annual meeting.

London Association of Foremen Engineers.—Saturday, May 8th. At the Cannon Street Hotel, E.C. At 6 p.m. 73rd Anniversary Festival.

Institute of Physics.—Tuesday, May 11th. At the Royal College of Science, South Kensington, S.W. At 5.30 p.m. Lecture on "The Relationship of Physics to Aeronautical Research," by Mr. E. H. Wimperis.

Royal Society of Arts.—Wednesday, May 12th. At John Street, Adelphi, W.C. At 8 p.m. Paper on "Industrial Welfare in Practice," by Mr. W. S. Bradley.

Radio Society of Great Britain.—Wednesday, May 12th. At the Institution of Electrical Engineers. At 6 p.m. Informal meeting.

Institution of Electrical Engineers (North-Western Centre and Mersey and North Wales (Liverpool) Centre).—Wednesday, May 12th. Reunion at Chester.

Institution of Production Engineers.—Wednesday, May 12th. At 83, Pall Mall, S.W. At 7.30 p.m. Paper on "Inspection Methods," by Mr. A. Butler.

Royal Institution.—Thursday, May 13th. At 21, Albemarle Street, W. At 5.15 p.m. Lecture on "The Imperfect Crystallisation of Common Things," by Sir William Bragg.
Saturday, May 15th. At 3 p.m. Lecture on "Atmospheric Electricity," by Dr. G. C. Simpson.

Faraday Society.—Thursday, May 13th. At the Institution of Mechanical Engineers, Storey's Gate, S.W. From 2.30 to 4.30 and 5 to 6.30 p.m. Discussion on "Explosive Reactions in Gaseous Media."

Birmingham Electric Club.—Friday, May 14th. Visit to the works of the English Electric Co., Ltd., and Siemens & English Electric Lamp Co., Ltd., at Preston.

Physical Society of London.—Friday, May 14th. At the Imperial College of Science, South Kensington, S.W. At 5 p.m. Ordinary meeting.

Notes.

School Lighting.—A paper on this subject was read by Dr. James Kerr, late School Medical Officer for London, at the meeting of the Illuminating Engineering Society on April 29th. He pointed out the special needs of children with regard to light; to them letters were unfamiliar and good illumination was even more needful than to the adult. Statistics showed that about a third of the children in schools failed to retain normal vision. The lecturer attached great importance to proper shading of light sources, especially in view of the general use of gasfilled lamps. He was disposed to recommend that no sources within the direct range of vision should have a greater brightness than 3 c.p. per sq. inch. Reference was made to interesting results obtained in the schools of Cleveland, U.S.A., where an average illumination of a little over 5 foot-candles is provided, and diffusing glass units with a brightness not exceeding 3 candles per sq. in. are used. Referring to the question of the colour of light, Dr. Kerr reported favourably on personal experience with a portable lamp equipped with Lamplough glass, and suggested that the question of the colour of light deserved attention in schools occupied by myopic children. During an interesting discussion which followed the lecture, Mr. C. Hughes exhibited a pleasing form of totally enclosed unit and several examples of modern reflectors equipped with half-frosted lamps, which were recommended for school lighting. Capt. Halsted Hanby showed examples of units equipped with tinted glass, of the type mentioned by Dr. Kerr, and Mr. L. Gaster referred to the work being done by the Committee on the Ideal Classroom and to the various American Codes of School Lighting, which advocated methods substantially in agreement with those recommended by the Society. Dr. Nash dealt with the subject from the standpoint of the medical officer.

The Electrical Trades Benevolent Institution.—Annual General Meeting.—On April 29th the annual general meeting of the E.T.B.I. was held at the Institution of Electrical Engineers. Mr. R. A. Chattock, president I.E.E., presided, and moved the adoption of the annual report of the Committee of Management and the accounts.

The report stated that the income from contributions for the year was £1,953, making with other receipts a total income of £3,128. After the payment of grants and expenses, £1,894 had been carried to the capital account. In respect of the year £773 had been invested, bringing the total invested funds at cost to £24,606. The number of grants had increased from 70 to 81; every qualified applicant received assistance. The Local Advisory Committees had increased the contributions and made the Institution better known, and the Committee hoped that further Committees would be created, for which purpose the co-operation of leading persons in the large towns was invited.

The annual festival was held on November 4th; Mr. E. S. Barralet presided, and his appeal brought in £1,389. The attendance was the largest recorded.

A new set of rules was under consideration, with a view to enrolling more contributing members and to simplifying the granting of assistance.

Commenting on the report, the Chairman compared the income for the year, £3,128, with that of the previous year, £3,810; the expenditure amounted to £299, compared with £292 in 1924, and included an item for travelling expenses of the hon. secretary in attending meetings in the provinces, from which good results were anticipated. The grants for temporary aid had increased in number from 70 to 81, and in amount from £899 to £935, figures previously unapproached; the cause was, first, the unsatisfactory state of trade, and secondly, the fact that the Institution was becoming more widely known. It had been more difficult to find employment for those who sought assistance than in any previous year. The invested funds cost £24,606, and their market value at the end of the year was £24,541, from which it was seen that the money had been well invested. The funds did not benefit so much by legacies as those of other institutions did. The E.T.B.I. and the Benevolent Fund of the I.E.E. kept closely in touch to avoid overlapping, and in some cases shared the cost of the grants. The Committee had been revising the Rules of the Institution, and when the work was completed, a special general meeting would be held to bring them into force.

Mr. J. Y. Fletcher having seconded the motion, the report and accounts were unanimously adopted.

Members of the Committee retiring by rotation were re-elected, and new members, Messrs. A. G. Beaver and J. E. Edgecombe, were elected. The hon. auditors, Messrs. Price, Waterhouse & Co., and the hon. solicitors, Messrs. Sugden, Bextall & Beal, were re-elected, and votes of thanks were passed to them, to the Press, and to the I.E.E. for the use of the room.

The Chairman referred to the presence of Mr. E. S. Barralet, president at the last Festival, and moved a vote of thanks to him for the services he had rendered to the Institution, which was warmly accorded; and the proceedings concluded with a vote of thanks to Mr. Chattock for presiding, moved by Mr. J. Y. Fletcher.

Appointments Vacant.—Electrical engineer, for the Aldershot Gas, Water and District Lighting Co.; telephone engineer for Singapore (£46 per month approx.), for the Oriental Telephone & Electric Co., Ltd.; Principal, for the Stafford County Technical School (£600); assistant electrical engineer ($400 per month+dollar=2s. 4d.), for the Government of the Federated Malay States; assistant electrical foreman, for the Gun Carriage Factory, Jubbulpore. (See our advertisement pages to-day.)

Urban Tramways.—That the tramway undertakings throughout Great Britain now carry more than 4,000 million passengers during the year and that their annual revenue exceeds £29,000,000 are facts which Mr. A. A. Jackson made evident in his recent paper before the Midland Section of the Institute of Transport. He dealt mainly with passenger fares, remarking that by certain recently promoted special Acts of Parliament, authority had been obtained to charge at a rate not exceeding 1½d. per mile per passenger. It had not been found practicable, or advisable, to introduce overlapping fare-stage points much less than half-a-mile apart. In a few towns contract or season tickets for periods of a week, month, or quarter had been issued. They were good for any number of rides and irrespective of the inidividual user, as it had proved to be practically impossible to make them non-transferable. Their general use was open to serious abuse on account of the multiplicity of fare stages and the difficulties of inspection and check. The price of all-day shilling tickets, usually issued on any day and available for any number of trips, was too high to permit of serious misuse. Transporta-

tion service could not be sold at a fixed price, but the price must vary from time to time with the cost of producing such service. Local conditions played a most important part in the fixing of fares. An adequate revenue must be secured and the ride must be paid for fully by the rider.

The Volta Centenary Celebrations.—The Committee which is organising the Volta Centenary celebrations which are to be held in Como, Italy, from May to October, 1927, has just commenced the publication of a monthly magazine with the title "Voltiana" dealing with the life work of the famous scientist and giving full particulars of the celebration preparations that are being made. Copies can be obtained from 11, Via Unione, Como, Italy.

London Electrical Engineers.—27TH (LONDON) ANTI-AIRCRAFT BATTALION, R.E. (T.A.).—Officer Commanding: Lieut.-Colonel C. H. S. Evans, O.B.E. The following orders have been issued for May:—304th Company, Major P. F. Foulger; 305th Company, Major A. W. M. Mawby, O.B.E., Tuesdays, 7 p.m. to 9.30 p.m. 306th Company, Major F. C. Clarke, Mondays, 7 p.m. to 9.30 p.m. Technical training is being dealt with very fully up to the annual training, which is being held this year from July 25th to August 8th at Manston (near Margate). A selected detachment of the unit will take part in training at Whitsuntide. Efforts are being made for an extensive recruiting campaign from May 10th to May 12th, when it is hoped with the generous assistance of employers to materially raise the strength of the unit.

Canadian Water Power.—The Toronto correspondent of *The Times* says that the Premiers of Ontario and Quebec have agreed to unite to defend their constitutional rights against any encroachment upon the power of the Provinces to control the generation and distribution of hydro-electric power.

The same correspondent reports that a provincial charter has been granted to the Spruce Falls Power and Paper Company authorising the construction of a hydro-electric power plant, and pulp and paper mills near Kapuskaing on the water courses to Hudson Bay. The New York *Times* is jointly interested in the new company. The enterprise involves the investment of $25,000,000, and the estimated daily production of the plant is 500 tons of paper and upwards of 120 tons of sulphite, also electric power for industrial purposes.

Social Event. — On April 24th, the staff of the Reigate Corporation electricity works celebrated the undertaking's 25th anniversary by a supper and social, presided over by Mr. T. W. Reed. The Mayor attended, accompanied by members of the Electricity Committee, and representatives of several electrical firms were present. During the evening Mr. W. S. Ross, the borough electrical engineer, who has been with the undertaking since its inception, was presented with an inscribed silver watch and a handbag for Mrs. Ross. The toasts included "The Mayor and Corporation," "The Borough Electrical Engineer and Staff," "The Contractors," and "The Visitors." A musical entertainment was provided.

Electric Milking Plant.—Mr. F. Swarbrick, borough electrical engineer, Basingstoke, has supplied particulars of cow-milking by electricity in practice, on the farm of Mr. Tom Bowden, Sherborne St. John, where some 64 dairy cattle are milked by equipment that was installed in August, 1925. According to the *Daily Telegraph*, tests showed that the cows were milked in 1¼ hours, and the consumption of the electric motor was 2.475 kWh, at 3d. per kWh, or 7.425d. Therefore the cost of electricity per day for milking 64 cows is 1s. 3d., and one man and two lads were required to do the whole work, whereas under the hand-milking system three men and three lads were necessary. This alone constitutes a saving of £5 10s. per week. Spread over a year, under the old system, the wages of three men at £6 per week, were £312 and three lads at £4 10s. per week £234, a total of £546. Under the new method the full cost is £332 5s., or a total saving of £213 15s. per year. The costs of the new method are: One man at £2 a week, £104; two lads at £3, £156; interest on capital expenditure at 5 per cent., £16 10s.; depreciation at 10 per cent., £33; and cost of electricity at 1s. 3d. per day, £22 15s. Although depreciation is taken at 10 per cent., it is very unlikely, contends Mr. Swarbrick, that this figure would be reached, as the whole installation is so well designed and constructed. The milk supplied at this farm is Grade A, T. T., and the official yield for last year was 900 gallons per cow.

Barrow Hydro-electric Scheme.—Last week, at Barrow Town Hall, Colonel T. C. Ekin, M.Inst.C.E., on behalf of the Electricity Commissioners, inquired into the application of the Barrow Corporation for consent to establish an hydro-electric station at Backbarrow, on the River Leven, and for sanction to borrow £90,000 for the purpose, this being £78,000 for the proposed station and £12,000 for transmission lines. The Town Clerk (Mr. L. Hewlett) was in charge of the case for the Corporation and opposition to the scheme came from four sources The Kent, Bela, Minster, Leven and Duddon Fishery Conservators, and Lord Richard Cavendish, owner of the salmon fishery of the river, represented by Mr. S. Hart Jackson, junr.; Ulverston Rural District Council, represented by Mr. N. E. Barnes; Barrow Property Owners' Association and Barrow Chamber of Trade, represented by Mr. J. Pickavance; and Barrow Ratepayers' Defence Association, represented by Mr. John Jackson. The Town Clerk submitted that the proposed scheme was a sound, practical one, and in support he called Alderman W. Fairbairn, J.P., chairman of the Corporation's Negotiating Committee, to explain the need for the scheme. Mr. H. R. Burnett, borough electrical engineer, explained the position at the Corporation's works in Buccleuch Street, Barrow, where the load factor was very high, and he gave statistics showing the necessity for the proposed station. The revised estimated cost of construction, based on Messrs. Vickers's tenders, plus the estimated cost of fish passes, was £90,000. A flow of 750 cu. ft. per sec. at 33 ft. effective head had been taken as representing the maximum output of the proposed plant (1,500 kW) and the output available for a year would be approximately 5,760,000 kWh generated. The total estimated annual cost of production would be £10,020 (£7,658) or 0.534d. (0.408d.) per kWh on an average anticipated output of 5 million kWh. The figures in parenthesis represented the estimated costs in the event of a Government grant being obtained, amounting to 50 per cent. of the interest on the capital expenditure (*i.e.*, £2,362 per year).

Mr. Burnett said the Corporation was prepared to make certain fish passes, and to meet some of the needs of the Ulverston Rural Council; he pointed out that only once in 27 years had the electricity department had a loss, and that was a very small one. He agreed that Messrs. Vickers had "a super-power station" at Barrow, but it was better, in his opinion, to have the Backbarrow station.

Mr. R. W. Hogarth, M.Inst.C.E., of Messrs. Buchan and Partners, Westminster, an expert on hydro-electric stations, gave evidence in support of the scheme. After full inquiry into all the circumstances and data he estimated that on the basis of 1925, which was a dry year, there would have been six million kWh generated, and after deducting 800,000 kWh for compensation and 56,000 kWh for works and losses, he arrived at 5,144,000 kWh. The supply would be the cheapest obtainable, and the scheme was excellently laid out. The opposition with regard to fishing in the river was met by arrangement.

The Ulverston Rural District Council's opposition related to certain water supplies for works and domestic purposes; eventually there was an agreement with the Rural Council, subject to the decisions of the Electricity Commissioners.

The contention of the Barrow Property Owners' Association and the Barrow Chamber of Trade was that owing to the bad financial position of the town the scheme should be postponed and that a further arrangement should be made with Messrs. Vickers, Ltd., for any extra electricity necessary.

Mr. John Jackson, of the Barrow Ratepayers' Defence Association, handed in a petition bearing 10,157 signatures demanding that a referendum be taken in the town on the scheme.

Colonel Ekin pointed out that it was addressed to the Mayor, Aldermen and Councillors. Why was it presented to him? On the first sheet were two signatures which appeared to be those of a ratepayer and his wife. It seemed to him incredible that in a town of 15,000 ratepayers there should be over 10,000 signing the petition.

The Town Clerk, in completing the inquiry, submitted that he had proved by evidence that the scheme was a sound one, which would overcome the Corporation's difficulties for some years to come. There was not the slightest chance of the scheme being a charge on the rates, and he stressed the point that a supply authority should not be dependent for its electricity upon a private firm.

A New Alloy Steel.—Sir Robert Hadfield last week, announced at Sheffield the discovery of a new alloy steel capable of withstanding abnormally high temperatures. A gas turbine wheel made of the new steel had been tested at 55,000 revolutions a minute, so that it was working at a temperature of 800 to 900 deg. C., being brought to a very bright red heat without its efficiency being impaired. The new steel, he said, would no doubt help to solve many industrial problems in the application of high-temperature gases.

The British Association.—As has been previously announced, the 1927 meeting of the British Association for the Advancement of Science is to be held in Leeds. Last week the period was fixed as from August 31st to September 7th.

Electrical Association for Women.—A lecture on "Lighting" was given in the Medical Theatre, Birmingham University, on April 28th, to the Birmingham and Midland Branch of the Electrical Association for Women by Mr. C. McDonald, chief electrical engineer of the Birmingham Post Office. He traced the growth of artificial lighting and gave practical demonstrations of the developments in electric lamps, illustrating by means of slides the various systems of lighting—direct, indirect and semi-indirect. In discussing household illumination he emphasised the importance of decoration in relation to light.

Institution of Engineers-in-Charge (Inc.). — ANNUAL DINNER.—On Friday last the annual dinner of the Institution of Engineers-in-Charge was held at the Holborn Restaurant, London; the president, Engineer-Vice-Admiral Sir Geo. G. Goodwin, K.C.B., was in the chair, and covers were laid for about 270 members and guests.

After the loyal toasts, Mr. L. Pendred, M.I.Mech.E., vice-president, proposed "The Lord Mayor, the Sheriffs, and the Corporation of the City of London," remarking that it was 16 years since the Institution had been honoured by the presence of the Lord Mayor; it was the only engineering institu-

tion domiciled in the City. He referred to the educational engineering work accomplished by the Guilds of London, which had done much to raise the status of engineers, and expressed a hope that the Lord Mayor would use his influence towards rectifying the Fleet order by which naval engineers had suffered injury.

In reply, the Lord Mayor, Col. Sir W. R. Pryke, acknowledged the indebtedness of the community to the work of engineers and engineering institutions, and said that the Livery Companies were all glad to do what they could for the public welfare. Proposing "The Institution," Eng.-Vice-Admiral Sir Robert B. Dixon, K.C.B., remarked that the Institution was now 25 years old, and complimented it on the high standard of its papers and discussions; there were many institutions, he said, some of which overlapped, but the Institution of Engineers-in-Charge poached on no-one's preserve. He congratulated the Social Committee on its excellent work, and was glad to see that the benevolent fund was in a very satisfactory position. At sea, he said, they watched closely the progress of engineering on land, and recently a ship was launched whose boilers would work at 500 lb. pressure. Responding, the President pointed out the unique circumstance that the toast was proposed by the Engineer-in-Chief of the Fleet, and responded to by the previous holder of that position —with whom he had always worked most harmoniously. The Institution, he said, was very particular regarding the qualifications of candidates for membership, a regular works training being an indispensable requirement. The proceedings contained many valuable papers. The formation of a Students' Section was in contemplation.

Mr. W. Edwards, vice-chairman, proposed "Our Guests and Friends," expressing the gratitude of the Institution for their help and guidance, and Mr. R. A. Chattock, president I.E.E., responding, remarked that his old friend, Mr. Frank Bailey, who gave him his first job as an engineer-in-charge, was present. There were three institutions catering for engineers-in-charge, the others being the E.P.E.A. and the S.T.E. Could they not amalgamate, with advantage, and thus strengthen the position of the young engineer? He cordially agreed with Mr. Pendred regarding the Admiralty order; the I.E.E. would do all that was possible to further the interests of engineers in the Navy and to maintain their status. The engineers-in-charge of small central stations were concerned as to their future under the new Bill, but the electricity supply industry was growing so fast that there would be plenty of outlets for their energies in connection with distribution.

Mr. J. M. Dawson proposed "Our President" in felicitous terms; the toast was accorded musical honours, and the President, in response, paid a tribute to the work of the hon. secretary, Capt. A. E. Penn, and the Chairmen of Committees. The normal membership was 500; but 50 new members were being enrolled in one year. With regard to naval engineers, the officers serving could not speak, but it was a fact that the loss of the purple stripe took a great deal away from the engineer officers, though it did not greatly affect the executive officers. He was glad that action was being taken by the Institutions in this matter.

Amongst the guests not mentioned above were Dr. Alex. Russell, F.R.S., past-president I.E.E., Sir Joseph Petavel, K.B.E., F.R.S., and Mr. W. McClelland, C.B., O.B.E.

A very good entertainment added to the pleasures of the evening.

Junior Institution of Engineers' Dinner.—The annual dinner of the above-named Institution was held at the Café Monico, London, on April 27th, the forty-seventh anniversary of its foundation. The president (Mr. J. S. Highfield) occupied the chair, and was kept busy with a host of unofficial toasts called for by Mr. Tookey with the aid of a business-like spanner. The principal guests included Sir Frank Dyson (Astronomer Royal), Mr. W. Reavell (president of the Institution of Mechanical Engineers), Air Vice-Marshal Sir W. Sefton Brancker (Director of Civil Aviation), Air Vice-Marshal Sir Vyell Vyvyan, Col. The Master of Sempill, and Mr. J. P. Rowen (chief engineer, Trinity House Corporation). Sir W. Sefton Brancker, who has accepted a vice-presidency of the Institution, prompted other speakers to make references to the speed of travel, while both Mr. W. J. Tennant and Mr. W. Reavell made a plea for a greater appreciation amongst engineers of the commercial side of engineering, the former remarking that if ever he should make a million he would found a Chair of Engineering Economics; meanwhile, perhaps someone who had a million would take the hint. During the evening Miss Bessie Kerr sang well, and Mr. L. Hamilton "entertained," Mr. R. Cooper being at the piano.

Institution Notes.

Institution of Electrical Engineers. — North-Eastern Centre.—The annual general meeting of the above Centre was held on April 26th, when the annual report of the Committee was presented. The membership of the Centre at the end of the session 1925-26 was 509, as compared with 512 at the end of the previous period. The new officers and Committee for the next session were appointed. The chairman will be Mr. J. Rosen, M.I.E.E.; vice-chairmen, Messrs. Hugh Paterson, A.M.I.E.E., and E. Fawssett, M.I.E.E.; hon. sec., Mr. P. F. Allan, M.I.E.E.

Institution of Public Lighting Engineers.—The third annual meeting and conference of the above Institution will be held at Newcastle-upon-Tyne in September. Application has been made to the Ministry of Health in respect of the expenses of the delegates attending the meeting, and a reply has been received to the effect that the Minister of Health will be prepared to consider applications from local authorities whose accounts are subject to Government audit for sanction to the payment of the expenses of the attendance at the meeting and conference of not more than two delegates, one of whom should be the engineer or superintendent for public lighting in the district.

The Röntgen Society.—A general meeting will take place on Thursday, May 20th, at 8.15 p.m., in the Barnes Hall of the Royal Society of Medicine, London, when the seventh Mackenzie Davidson Memorial Lecture will be delivered by Dr. A. Dauvillier, Paris, the subject being "The Measurement of X-ray Dosage."

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

The *Journal* of the Associated Chambers of Commerce in China and Hong Kong reports that Mr. P. B. Critchley, who has been associated with the Shanghai Municipal Electricity Department for 25 years, has retired. He was to return to England by the *Empress of Scotland*.

At a recent meeting of officials and staff of the Lincoln electricity undertaking, Mr. Stanley Clegg was presented with a travelling case to mark his completion of 25 years' service as chief engineer. Mrs. Clegg received a scent spray.

Mr. A. Hewitt and Col. Cortez Leigh have been re-elected chairman and vice-chairman respectively of the North Wales and South Cheshire Joint Electricity Authority for a further period of three years.

We are pleased to learn that Mr. Guy Burney, who recently underwent a serious operation to his ear, is making satisfactory progress.

The Times states that the Carnegie Hero Fund Trustees have awarded the bronze medallion, their highest award, and an allowance of £200 per annum to Dr. George Alexander Pirie, Dundee, who has become permanently incapacitated as the result of injuries received through engaging in X-ray work.

The French Académie des Sciences has awarded the Gaston Planté prize for 1925 to M. Joseph Bethenod, of the Ecole Supérieure d'Electricité, Paris, for his work on the generation and utilisation of high-frequency alternating currents. The Hebert prize has been awarded to M. Edouard Roth, of the Société Alsacienne de Constructions Mécaniques, Belfort, for his work on alternators and synchronous motors.

The *Central News* reports that Dr. Lobligeois, of Paris, has had to have an arm amputated consequent upon injuries due to the effect of radium. This is the fourth operation which the doctor has sustained from the same cause.

Mr. Robert Millar, electrician at Bowhill Colliery, Fife, received parting gifts at a recent social meeting at which Mr. John Kerr, head electrician at the colliery, presided. The presentation was made by Mr. T. Lister, of the electrical shop.

The *Sydney Morning Herald* states that the Sydney City Council at a recent meeting decided that the acting general manager of the electricity department (Mr. Maling) should be paid an allowance at the rate of £1,500 per annum additional to his present salary of £2,000 per annum. This allowance will be paid during the absence in London of the general manager of the department (Mr. Forbes Mackay). Mr. Mackay's fixed salary is £2,000 per annum, and he is paid an allowance at the rate of £1,500 per annum whilst absent from Sydney, in addition to travelling and other expenses. Reform aldermen objected to the allowance being paid to Mr. Maling in view of the fact that he was already being paid a salary equal to that of the general manager. The Labour party, on a party vote, decided that the allowance should be paid, and by a similar vote, defeated an amendment moved by Alderman Cole that Mr. Maling should receive an allowance of £1,000.

It is announced that Mr. W. M. Furniss, manager of the company's works at Wolverhampton, has been elected to the seat on the board of the Electric Construction Co., Ltd., rendered vacant by the death of Sir Henry C. Mance.

Obituary.—Mr. A. M. Conway.—It is reported in the Australian Press that Mr. Arthur M. Conway, chief electrical engineer for Orange, passed away in March at the age of 38 years. Mr. Conway, after training at the Sydney Technical College, went to America and held a position with the General Electric Co. of Schenectady. In the San Francisco earthquake he lost all his belongings, and after returning to Sydney he became, for a time, assistant general manager of the Australian General Electric Co., which position he resigned to take up his post at Orange.

Mr. T. Ferguson.—The death has occurred, at the age of 28 years, of Mr. Thomas Ferguson, an electrical engineer with the Sunderland Forge Co., at Birkenhead.

PROF. L. A. HERDT.—The *Engineer* records the death, which occurred on April 11th, of Prof. Louis Anthyme Herdt, Macdonald Professor of Electrical Engineering at McGill University. Prof. Herdt, who was born in France 53 years ago, is described as one of the leading electrical engineers of Canada, and one who had a part in many great electrical enterprises.

MR. M. KEATING.—The death occurred in London, on April 28th, of Mr. Maurice Keating, Superintendent of the Eastern Telegraph Co., Ltd., at Carcavelos Station, Portugal (late of Cahirciveen, Co. Kerry).

MR. H. BJERKE.—The *Anglo-Norwegian Trade Journal* records the death, last month, of Mr. Harald Bjerke, who was, until recently, director-general of the Norsk Hydro-Elektrisk Kvælstofaktieselskab. Prior to taking this position, Mr. Bjerke had been managing director of a number of industrial concerns in Norway.

Wills.—The late Sir THOMAS BROOKE-HITCHING, who was a director of the Chiswick Electric Supply Corporation, Ltd., and the West London and Provincial Electric Supply Co., Ltd., left £79,245 gross and £57,633 net personalty.

The late Mr. J. BROWNE MARTIN left £560,685 gross and £399,763 net personalty.

New Companies Registered.

Norton Wireless Co., Ltd. ((213,504).—Private company. Registered March 28th. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers, importers and exporters of and wholesale and retail dealers in radio sets, &c. The subscribers (each with one share) are:—Jessie M. Kelly and T. Kelly, 13-14, Broadway, Deptford, S.E., radio dealers. The subscribers are to appoint the first directors. Qualification, 1 share. Remuneration, £100 each per annum. Solicitor: E. L. L. Foakes, 221, Bishopsgate, E.C.2.

C. A. C. Valve Distributing Co., Ltd. (213,497).—Private company. Registered April 28th. Capital, £100 in £1 shares. Objects: To carry on the business of electrical and motor engineers and contractors, suppliers of electricity, manufacturers, importers and exporters of and wholesale and retail dealers in railway and tramway appliances, telegraphic, telephonic, and radio apparatus, &c. The first directors are:—G. E. Ward, 10, Rangoon Street, E.C.3, managing director of a company; E. G. Brett, 10, Rangoon Street, E.C.3, secretary. Qualification, 1 share. Solicitors: Bateman & Co., 5, John Street, Bedford Row, W.C.1. Registered office: 10, Rangoon Street, E.C.3.

Sun Signs, Ltd. (213,460).—Private company. Registered April 26th. Capital, £1,000 in 500 10 per cent. cumulative preference shares of £1 each and 10,000 deferred shares of 1s. each. Objects: To acquire the whole or any part of the right, title, and interest in or appertaining to the provisionally protected invention comprised in or covered by provisional patent specification No. 22,936/1925, concerning "improvements in or relating to displayed signs," and to carry on the business of designers and manufacturers of and dealers in all kinds of signs, and displayed advertisements of all kinds, but more particularly in relation to the invention known as the "Sun-Sign" for affixing or applying to electric glow lamps or any other form of artificial lighting, &c. The directors are:—R. C. Spurin (permanent managing director), 12, Oakley Square, N.W.1; F. Hinde, 28, Adelaide Road, N.W.; C. Pedgrift, 12, Oakley Square, N.W.1. Qualification, 100 shares. Remuneration as fixed by the company. Registered office: 8, Red Lion Square, W.C.1.

Wico Electric Co. (F.2530).—Particulars of this company (incorporated outside the United Kingdom) were filed on April 22nd pursuant to Section 274 of the Companies (Consolidation) Act. The capital is $400,000 in $100 shares (2,000 shares preferred stock and 2,000 shares common stock). The company was incorporated in Massachusetts, U.S.A., on March 23rd, 1920, to manufacture and sell magnetos, storage batteries, electric ignition equipment, and electrical and mechanical specialities of all kinds. The British address is Chase Estates, Willesden Lane, North Acton, N.W.10. H. G. Brown, solicitor, of 2, Bond Court, Walbrook, E.C.4, is authorised to accept service of process and notices on behalf of the company. No list of directors has yet been filed.

Great Western Ignition Co,, Ltd. (213,517).—Private company. Registered April 29th. Capital, £2,000 in £1 shares. Objects: To carry on the business of manufacturers and repairers of and dealers in electrical materials, goods and appliances, and also electrical and other automobile accessories and fittings, accumulators, batteries, dynamos, &c. The directors are:—R. C. Jackson, 52, Ashley Road, Bristol; A. R. Matthews, 7, Guinea Street, Redcliff Hill, Bristol. Qualification, 100 shares. Solicitors: Plummer, Parry & Patchett, 16, John Street, Bristol.

Norwich Wireless Co., Ltd. (213,526).—Private company. Registered April 29th. Capital, £1,000 in £1 shares. Objects: To carry on the business of radio engineers and manufacturers of and dealers in radio apparatus, consulting wireless experts, &c. The directors are:—S. Sacker and Mrs. S. Sacker, 19, Honeywood Road, Colchester.

Turkin, Ltd. (213,479).—Private company. Registered April 27th. Capital, £500 in £1 shares. Objects: To carry on the business of electricians, mechanical engineers and manufacturers and workers of and dealers in electricity, radio experts, &c. The subscribers are:—C. R. Turner, 2, Clovelly Gardens, Upper Tulse Hill, S.W., merchant; M. Moses, 119, Finsbury Pavement, E.C.2, solicitor's clerk. The first directors are not named. Solicitors: Cochrane & Cripwell, Balfour House, 119, Finsbury Pavement, E.C.2. Registered office: 32, West Street, Weston-super-Mare.

J. W. Peacock & Co. (1926), Ltd. (213,386).—Private company. Registered April 23rd. Capital, £500 in £1 shares. Objects: To acquire an electrical device known as "Walker's Patent Counter Sign," to adopt an agreement with J. W. Peacock and D. D. Walker, trading as "J. W. Peacock & Co.," and to carry on the business of manufacturers of and dealers in furniture, fancy and sports goods, jewellery, watches, clocks, chronometers, and optical and scientific instruments and appliances, electricians, &c. The permanent directors are:—E. R. Mountstephen, 797, London Road, Westcliff-on-Sea, ironmonger; J. W. Peacock, 26, Hamlet Road, Southend-on-Sea, furniture dealer; M. St. J. C. Shepherd, Eastwoodbury, Southend-on-Sea, electrical engineer; D. D. Walker, Ravensknowle, Springfield Drive, Westcliff, Southend-on-Sea, engineer. Qualification, £50. Remuneration, £100 per annum, divided between them. Secretary: J. W. Peacock. Solicitor: F. T. Fisher, 44, Alexandra Street, Southend-on-Sea.

Stanley Cox, Ltd. (213,425).—Private company. Registered April 24th. Capital, £1,200 in £1 shares (500 8 per cent., tax free, cumulative preference and 700 ordinary). Objects: To carry on the business now carried on by S. Cox at 30, Percy Street, Tottenham Court Road, W.C., and to carry on the business of manufacturers, commission agents, and merchants of electrical or other apparatus, &c. The directors are:—S. Cox (permanent managing director), "Ravensthorpe," Beltinge Road, Herne Bay, Kent, electro-medical engineer; R. H. Stevens, address not stated.

Official Returns of Electrical Companies.

Twiss Electric Transmission, Ltd.—R. H. Stevens, C.A., of 37, Walbrook, E.C.4, was appointed receiver and manager on April 19th, 1926, under powers contained in debenture dated September 28th, 1921.

Radio Equipment Co., Ltd. — C. Latham, of 78, New Oxford Street, W., was appointed receiver on April 22nd, under powers contained in debenture dated February 10th 1926.

Thornley & Co., Ltd.—Debenture dated April 19th, 1926, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Nettlefold & Sons, Ltd., 54, High Holborn, W.C.

India Rubber, Gutta-Percha and Telegraph Works Co., Ltd.—Particulars filed of £400,000 debentures authorised January 28th, and covered by trust deed dated March 29th, 1926, charged on certain properties at West Ham and Liverpool, and the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued. Trustees: J. S. Cockburn, Sir John Ferguson, K.B.E., Sir Henry C. Mance, C.I.E., and the Hon. S. E. Marsham.

Nelson Electric Co., Ltd.—Particulars filed of £1,000 debentures authorised March 26th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £600.

Melbourne Electric Supply Co., Ltd.—Mortgage or charge executed out of the U.K., and comprising solely property situate outside the U.K., dated February 9th, 1926, to secure £100 and further moneys due to the sent and future including uncalled capital, the whole amount being now and future. Holder: Sir Alexander J. Peacock, K.C.M.G., Treasurer of the State of Victoria.

R. & T. Patents, Ltd.—A. A. Whittingham-Jones, of 41, Castle Street, Liverpool, ceased to act as receiver or manager on April 23rd, 1926.

Thornley & Co., Ltd.—Satisfaction in full on April 8th, 1926 of debenture dated April 12th, 1923, securing £500.

Lewis Thomas & Sons, Ltd.—Debenture dated April 1st, 1926, to secure £1,500, charged on the company's undertaking and property, including uncalled capital. Holder: J. D. Williams, Boulevard, North Parade, Aberystwyth.

W. Robson & Sons, Ltd.—First charge on the company's property, present and future, including uncalled capital, dated March 31st, 1926, to secure £600. Holder: T. W. Robson, 226, Westminster Road, Liverpool.

Neutron, Ltd.—Particulars filed of £1,300 debentures authorised April 12th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £250.

Electric Fires, Ltd.—Mortgage dated April 8th, 1926, to secure £6,000, charged on certain properties, &c., in Norwich. Holder: Miss M. S. Reeve, 29, Thorpe Road, Norwich; and N. J. Adams, Stratton House, Cirencester.

"Ego" Engineering Co., Ltd.—W. A. J. Osborne, of Balfour House, Finsbury Pavement, E.C.2, accountant, ceased to act as receiver or manager on April 9th, 1926.

London Power Co., Ltd.—A trust deed dated April 15th, 1926, securing £3,000,000 5 per cent. redeemable debenture stock has been registered, constituting a floating charge on the undertaking, property, assets, and revenues of the company, present and future. The trustees are: The Law Debenture Corporation, Ltd., 24, Old Broad Street, E.C.2. The debenture stock was issued at a discount of 4 per cent.

Radio Communication Co., Ltd.—Mortgage or charge on the company's undertaking and property, present and future, including uncalled capital, dated April 14th, 1926, to secure £81,500. Holder: R. Sweeny, 20, Copthall Avenue, E.C.2.

Cooke & Whitfield Wireless, Ltd.—E. P. Q. Carter, of 33, Waterloo Street, Birmingham, C.A., was appointed receiver and manager by order of Court dated April 16th, 1926.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Urban Electric Supply Co., Ltd.

The annual meeting was held on April 29th, Mr. P. D. Tuckett presiding. In moving the adoption of the report (*vide* our last issue, p. 711), the chairman said that it was eminently satisfactory. There was an 18 per cent. increase in the balance carried to net profit and loss account and a 26 per cent. increase in the net profit. Such a marked improvement in the Company's earning capacity was very gratifying; the shareholders had at last reached the stage of receiving a more adequate return on their investment and he hoped that they would be able to maintain it. The improved result had been brought about by the general expansion of the business and by a further reduction in the ratio of working expenses, the largest individual contribution coming from the Cornwall Power Company. The connections for the year showed a 6 per cent. increase and the output increased by 11 per cent., of which nearly two-thirds was attributable to the Cornwall Power Company. The outlook in Cornwall continued to improve, all the mines being actively engaged on extensive developments and looking forward confidently to the future if the price of tin remained at anything like its present figure, as it was considered likely to do for some years to come. To meet the growing load they were considering the extension of their power station at Hayle with the expectation of largely increasing its efficiency, and the stability and profit-earning capacity of the business. In

spite of the improved position which the balance sheet disclosed, he would not like them to infer that the reserves were in any degree over-adequate, with £100,000 of their capital sunk in unremunerative tramways, with their liability to write off the cost of their stations in the event of bulk supplies becoming available, and with the possibility of loss on purchase of their undertakings by the local authorities. Last year he had addressed the bulk of his remarks to the disquieting result of the inquiry which had recently been held into their prices at Stamford. They had since had another inquiry in connection with their Twickenham undertaking, the outcome of which had very much reassured them, for it had established the principle that they were entitled to earn the necessary minimum to enable them to form adequate reserves and provide a reasonable return on capital, whilst they on their part, in proof of their *bona-fides*, had undertaken to pass on to their consumers during the next three years any surplus profits over and above that necessary minimum. A number of substantial reductions had been made and further decreases were contemplated when they were in a position to make them. In view of the possibility of a general stoppage in the coal industry with all the disastrous consequences which it would have on the industries of the country, it was impossible to forecast at the moment what were their prospects for the present year. Apart, however, from any untoward development of that nature, they had no reason to anticipate anything but a period of steady and continuous progress; they had ample stocks of coal at all their stations. At the moment they were devoting their attention to the Government's Electricity (Supply) Bill now before Parliament in an endeavour to protect their interests. He did not propose to discuss its provisions in any detail, because many of them were so manifestly unfair and unworkable that they felt they were bound to be drastically amended in committee. With the avowed objects of the Bill, to cheapen electricity and stimulate its use, they were all in hearty accord, but with the proposed method of realising them they were most of them in entire disagreement, since they thought it was calculated to hamper existing undertakers by costly and unnecessary bureaucratic interference and to discourage private enterprise by impairing its ability to attract fresh capital. So far as their small undertakings were concerned, they would welcome the opportunity of availing themselves of cheap bulk supplies, provided that, in the event of their purchase by the local authority, they were not prejudiced by the shutting down of their stations. In their Twickenham and Cornwall areas they had already taken advantage of the bulk supply facilities available, but in most of their other isolated undertakings it was difficult to believe that for a good many years to come it would be commercially possible for any centralised organisation to afford them a cheaper supply than they could themselves generate locally owing to the excessive cost of transmission. Mr. Edmund Charrington seconded the motion and it was carried unanimously.

Johnson and Phillips, Ltd.

The company's annual meeting was held on April 29th. Mr. W. Claude Johnson (chairman), who presided, in moving the adoption of the report and accounts (*vide* our last issue, p. 710), said that the available balance was £152,133. The interest on the debenture stock was over £4,000 less than last year, largely owing to the reduction of the interest from 8 to 6 per cent. for the last six months of the year; the item would be reduced by about another £4,000 in the current year. The share capital had been increased from £500,000 to £600,000 by the issue of 100,000 new shares at 40s. per share on December 1st last. The premium of 20s. per share, amounting to £100,000, together with the premium of 2s. per share on the previous issue, amounting to £6,250, had been transferred to reserve account which with the £43,750 transferred from the profit and loss account, increased the reserve to £250,000. Over £63,000 had been spent on additions to the company's property. That was necessary in order to cope with the great increase in the amount of business which was continuing. Stock in trade and work in progress at about £479,800 and sundry debtors at just over £400,000, showed an increase of nearly £120,000, owing to the very large increase in the amount of business in hand at the end of the year, the profits from which would go to the benefit of the current year. It was fitting that the firm's jubilee year should have provided such record figures. The record turnover had been rendered possible by the greatly increased output capacity of the shops and the efficiency of the selling organisation. The extensions which they had carried out during the last two or three years had proved of inestimable value, enabling them not only to increase the turnover but to do so in a most efficient and economical manner, consistent with the maintenance of their high reputation for quality. The programme of extensions which they had in hand was well advanced. Attention had been paid to the question of selling and distributing the further increased output; the directors had always regarded productive capacity and selling capacity as contemporaneous—the one could not develop without the other. They had strengthened their sales and distribution organisation both at home and abroad. In conclusion, Mr. Johnson said that he was confident that the current year's results would be even better. Mr. J. McGregor (managing director), in seconding the motion, said that the work in all departments had increased, and there was every prospect of still greater business in the ensuing year. The Electricity Bill now before Parliament, if carried through successfully, would be of great national benefit. It would give the manufacturers of the whole country cheap power for production, lighting and transport, and, incidentally, it would bring the company large orders for most of its manufactures. Their finances would enable them to take full advantage of that increase in business, and they would be fully equipped with up-to-date machinery and working facilities, to deal with all requirements. The prospects were very bright and there appeared to be nothing to prevent their progressing, provided always that there was labour peace. During the last 21 years the capital had risen from £175,000 in ordinary shares with £175,000 of debentures, to £600,000 in ordinary shares with £300,000 of debentures, and the assets had risen from £362,832 to £1,376,934. The directors had been able to pay an interim dividend last year and they hoped to continue the practice. He believed that they would be able to increase the dividend next year.

Indo-European Telegraph Co., Ltd.

Presiding at the annual meeting on April 29th, the chairman (Mr. H. L. M. Tritton) said that the company's relations with the various Governments from which it enjoyed concessions remained satisfactory. He regretted that the Black Sea cable was still out of operation, but hoped that a way would soon be found out of the difficulties which surrounded that matter. Great strides had been made recently in cable communication, and there was ample room for that system of communication, as well as for land lines and radio-telegraphy. Mr. Tritton outlined the company's system, and said that it only transmitted messages directly; there was no delay at intermediate stations. They had a very efficient maintenance system which reduced interruptions to the minimum, and transmission errors were a very small proportion indeed in their large traffic. Dealing with the accounts, the chairman said that the expenditure on the reconstruction of the line in Russia and Poland, which was still in hand, showed an increase. That item and the one relating to the Persian section had been further reduced by sums set aside out of revenue. They had been able to maintain the dividend at 7 per cent., free of tax, and to increase the bonus from 1½ to 3 per cent., free of tax.

Telephone Manufacturing Co., Ltd.

In a recent announcement, the directors point out that the company's bank loan, which has to be met by annual instalments of £40,000, together with the interest on the 8 per cent. income bonds, is a great strain upon the revenue, exceeding the total profit. Accordingly, a reorganisation scheme has been drawn up. Under this, the 410,000 issued shares of £1 each would each be divided into two 10s. shares, half of which would be retained by the present shareholders, while the other half would be issued to those who subscribe the additional capital which it is proposed to raise. In addition, the unissued shares (590,000) would be divided. A provisional agreement has been entered into with the Rock Investment Co., by which that company agrees to buy all the shares which would thus remain to be issued (1,590,000) for £590,000 in cash (less a commission of £88,500). By this means the company would obtain sufficient capital to pay off the 8 per cent. bonds and the bank loan, and £65,000 would remain as additional working capital. The arrangements with the Rock Investment Co. include an option to existing shareholders to purchase not fewer than 1,000,000 new shares at 7s. 6d. each.

By order of the High Court, a meeting of members will be held at Cannon Street Hotel, E.C., on May 12th, for the purpose of considering and, if thought fit, approving this scheme of arrangement proposed to be made. A copy of the scheme can be seen at the offices of the company, Hollingsworth Works, Martello Road, West Dulwich, S.E.

Swansea Improvement and Tramways Co., Ltd.

The meeting of this company, whose report was reviewed in our last issue (p. 711), was held on April 28th. Mr. C. G. Tegetmeier, who presided, said that the reduction in the revenue was disappointing in view of the facts that increased facilities had been provided and that the number of passengers had risen. The decrease was due to an increased proportion of workpeople carried. This heavily handicapped the company and it was impossible to reduce fares if they were to make proper provision for maintenance and renewals, and provide a reasonable return upon the capital. It had been said that motor 'buses had rendered tramways obsolete. That was certainly not the case in Swansea, where proper co-ordination had allowed an efficient tramway system to flourish side by side with an efficient omnibus undertaking. The Swansea Corporation had realised that unlimited competition in transport was not in the interest of efficiency or of advantage to the travelling public.

German Companies.

The directors of the *Hartmann and Braun Company*, Frankfort-on-Main, recommend a dividend at the rate of 5 per cent. for 1925, as in the previous year.

The *Emag Electricity Company*, Frankfort-on-Main, proposes to pay a dividend of 5 per cent. for 1925; there was a small loss in the preceding year.

The *Mix and Genest Telephone and Telegraph Works Company* proposes a dividend at the rate of 8 per cent. for 1925, as against 6 per cent.

The *Wolfram Lamp Company*, Augsburg, which is under the influence of the German Osram Company, reports net profits

of 62,000 marks for 1925, as compared with 50,000 marks in the previous year. It is intended to pay a dividend at the rate of 10 per cent., against 6 per cent.

The *German Cable Works Company*, Lichtenberg, Berlin, states that the business was removed from the old to the new works during 1925, the new copper rolling mill was completed, and additions were made to the machinery. After providing for depreciation the accounts show net profits of 376,000 marks, as against 395,000 marks in 1924, the dividend remaining at 6 per cent. The directors state that success attended the resumption of the export of cables, especially in the English market. The current year has so far been favourable.

French Companies.

The *North-South Electric Railway Company*, Paris, records net profits of 5,505,000 fr. for 1925, and is distributing a dividend at the rate of 12.76 fr. net per registered share and 10.44 fr. per bearer share. The City Council has asked the company whether it would be willing to transfer its undertaking before the pre-determined date. The company is said to be prepared to submit an acceptable scheme for the consideration of the shareholders.

The *Société Electro-Chimie, Electro-Metallurgie Ugines*, Paris, is increasing its capital from 80 to 120 million francs.

The *Compagnie Radio-Maritime* again proposes to pay a dividend at the rate of 22 fr. per share for 1925.

The *Compagnie Radio-Orient* intends to increase the rate of distribution from 4 per cent. to 6 per cent. for 1925.

Belgian Companies.

The *Société de la Fabrication des Câbles et Fils Electriques*, Brussels, reports a net profit of one million francs for the last financial year, as compared with 825,000 fr. in 1924.

The *Société Générale Belge d'Entreprises Electriques*, which is an investment company, reports an increase in the revenue from 7,390,000 fr. in 1924 to 8,853,000 fr. last year. The net profits were 4,783,000 fr., as against 3,502,000 fr. in 1924, and it is intended again to pay a dividend of 55 fr. gross on the old shares and 18.75 fr. on the shares issued during 1925. The directors express satisfaction with the progress made by the different undertakings, principally the works concerned with the supply of electricity.

Dutch Company.—*Philips Glowlamp Works.*—The Amsterdam correspondent of the *Financial Times* says that the gross earnings of this company during 1925 were 7,947,000 florins, as compared with 6,211,000 florins in 1924. After providing for depreciation, there is a balance of 4,000,000 florins, sufficient to pay 16 per cent. on the ordinary shares and 8 per cent. on the preferred. The extension reserve is increased from 7,414,000 to 9,410,000 florins.

Latin-American Company. — The *Compania Hispano-Americana de Electricidad*, Madrid, which a few years ago took over the electrical undertakings of the German Transmarine Electricity Company, reports gross profits of 72,457,000 pesetas for 1925, of which the sum of 34,079,000 pesetas has been applied to depreciation. It is proposed to pay a dividend at the rate of 14 per cent. as in 1924, although the share capital has been increased to 180,000,000 pesetas.

Madras Electric Tramways (1904), Ltd.—The directors' report for 1925 shows a gross profit of £35,190, and after meeting expenses and interest, and providing for depreciation and renewals, there remains a balance of £14,392, to which is added £7,124 brought forward, making £21,516. The preference and interim ordinary dividends absorbed £8,250, and it is proposed to pay a final dividend at the rate of 6 per cent. on the ordinary shares (making 6 per cent. for the year), to write £3,500 off the cost of the debenture issue, and to carry forward £7,516. The report says that a motor omnibus service was inaugurated during the year, and the tramway service is being accelerated. Although the cost of operating motor omnibuses is appreciably greater than the tramway expenses, the expenditure in Madras was reduced by 1.7 per cent. Meeting: May 11th.

Melbourne Electric Supply Co., Ltd.—The annual meeting was held in Melbourne in March. Mr. Agar Wynne, who presided, said that owing to the smaller amount of building which had been carried out in the city during the period under review there was a decline in the number of consumers connected; nevertheless the business was satisfactory. The results which had been obtained had justified the company's policy of keeping its distribution system well ahead of building developments in new areas. The valuation of the company's property was proceeding, and the directors hoped to be in a position soon to make a definite announcement of the exact purchase price which was to be agreed with the State Electricity Commission.

Pernambuco Tramways and Power Co., Ltd.—The report for the past year records net receipts of £170,270, as compared with £153,462 in 1924. After paying interest, &c., and putting £10,230 to capital reserve, £10,000 to reserve for contingencies, and £1,500 to the amortisation fund, the net profit is £35,515, as against £28,745. A dividend of 7 per cent. is to be paid on the preference shares. This is the first distribution since 1919, when 3½ per cent. was paid; £7,000 is transferred to general reserve; and a balance of £5,379 is to be carried forward. The number of passengers carried increased by six millions to 49,710,333, and the number of electricity consumers rose from 9,431 to 10,914.

Electrical Finance and Securities Co., Ltd.—After providing for debenture interest, office expenses, &c., amounting in all to £10,893, there remains a balance of £6,488 from 1925. To this is added £1,966 brought forward, making £8,454, out of which it is proposed to pay a dividend of 10 per cent., leaving £2,408 to be carried forward. The company is interested in the following undertakings, which all recorded progress:—The Northwood Electric Light and Power Co., Ltd.; the Foots Cray Electricity Supply Co., Ltd.; the Colne Valley Electric Supply Co., Ltd.; the Boston and District Electricity Supply Co., Ltd.; and the Lothians Electric Power Co. The report refers to the death of Mr. A. L. Radford, a director of the company since its inception. The meeting was to be held yesterday (Thursday).

Winnipeg Electric Railway Co.—The operating expenses declined and the gross earnings increased during 1925, raising the net income to $821,604. After allocating $374,050 to depreciation, a balance of $447,554 is carried forward to surplus account, making $1,042,343, and after paying dividends of 7 per cent. on the preferred stock and 2 per cent. on the common stock, there remains a balance of $612,343. The assets have been written down, and $73,100 has been transferred to bond sinking fund, leaving a balance of $380,287 to be carried forward.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Northampton Electric Light and Power Co., Ltd.—70,000 new ordinary "B" shares of £1 each, fully paid, Nos. 342,123 to 342,389 and 350,001 to 419,733.

Northern General Transport Co., Ltd.—118,750 new ordinary shares of £1 each, issued at par, 2s. 6d. paid, Nos. 475,001 to 593,750.

Application have been made to the Committee to allow the following to be officially quoted:—

Calcutta Electric Supply Corporation, Ltd.—150,000 five per cent. cumulative preference shares of £1 each, fully paid, Nos. 2,375,001 to 2,525,000.

North Metropolitan Electric Power Supply Co.—300,020 six per cent. cumulative preference shares of £1 each, fully paid, Nos. 599,891 to 900,000.

Ever Ready Co. (Great Britain), Ltd.—The accounts for the year ended March 31st last show (subject to audit) a net profit of £140,000, as compared with £96,000 in 1924-25. It is proposed to transfer £49,800 to reserve (against £35,000) and to carry forward £23,800 after paying the following dividends:—5 per cent. on the preference shares, making 10 per cent. for the year; and 5 per cent., plus a bonus of 15 per cent., on both the old and new ordinary shares, making 25 per cent. for the year in the case of the old ordinary shares. Meeting: June 1st.

Bogota Telephone Co., Ltd.—By order of the High Court, meetings of the holders of preferential and deferred shares of the above company will be held on May 19th at Magnet House, Kingsway, W.C., for the purpose of considering and, if thought fit, approving a scheme of arrangement proposed to be made. Copies of the scheme of arrangement can be seen at the offices of the company, Magnet House, or at the office of Messrs. Wild, Collins & Crosse, Kenman's House, Crown Court, Cheapside, E.C.

National Electric Construction Co., Ltd.—Mr. G. H. Nisbett, presiding at the annual meeting on April 29th, said that the company's profit had increased and a dividend of 10 per cent. was being paid. The dividend equalisation and general reserves had been increased. While the outlook for the future was promising, he was apprehensive of the effect of the Government's Electricity Bill which, unless it was drastically modified, would inflict immediate and lasting injury upon the electricity supply industry.

Callender's Cable and Construction Co., Ltd.—The directors recommend a final dividend of 2s. per share on the old and new ordinary shares, making in the case of the old shares 3s. per share for the year.

They also propose to increase the authorised ordinary share capital from £700,000 to £1,000,000, and to capitalise £200,000 of the reserves and issue it in the form of £1 ordinary shares to present holders in the proportion of one to three.

Rothesay Tramways Co., Ltd.—The directors report a net profit of £4,454 for 1925. To this is added £1,171 brought forward, making £5,625, and after meeting debenture interest and allocating £1,707 to renewals, it is proposed to pay a dividend of 3 per cent. on the ordinary shares, to transfer £2,000 to reserve, and carry forward £672.

International General Electric Co.—The value of the orders received in 1925 was $25,710,000, as against $17,590,000 in the preceding year. The net income amounted to $2,641,063 and, after paying dividends and interest, a balance of $1,917,204 is added to the accumulated surplus, bringing it up to $11,860,270.

Bengal Telephone Corporation, Ltd.—The *Financial News* states that the report for the year ended June 30th, 1925, showed a net profit of Rs. 3,24,313. A dividend of 2 per cent. was declared on the ordinary shares and Rs. 30,137 was carried forward.

Richardsons, Westgarth & Co., Ltd.—A dividend of 3 per cent. has been declared on the ordinary shares, as compared with 5 per cent. for 1924.

Mirrlees, Bickerton & Day, Ltd.—Under the terms of the amalgamation scheme with the Mirrlees-Watson Co., Ltd., a payment of 2s. 6d. per ordinary share is being made.

Western Union Telegraph Co.—The gross operating revenue for 1925 increased by 12 per cent. to $127,078,023, and after adding other receipts and deducting expenses, interest, &c., including an appropriation of $1,000,000 for the development of ocean cables, a surplus of $15,186,259 remained. To this was added $56,980,028 accumulated surplus and $4,514,192 profit from sale of securities, making $76,680,479. From this were deducted a further $4,200,000 for ocean cable development, dividends totalling $7,232,457, and adjustments of surplus $279,911, leaving a surplus at December 31st, 1925, of $64,968,111. The report states that about one-third of the net income is now set aside annually for taxes.

City of Buenos Ayres Tramways (1904), Ltd.—A dividend of 1s. 3d. per share has been declared in respect of the quarter ended March 31st.

Burma Electric Supply Co., Ltd.—An interim dividend of 4 per cent. has been declared on the ordinary shares, as compared with 3 per cent. in 1925.

Stocks and Shares.

Monday Evening.

On the eve of what may, or may not be, a General Strike, it is only natural that Stock Exchange markets should be in an extremely sensitive state. Prices gave way in all departments. There was no trace of excitement or of panic. Brokers and jobbers found themselves with little to do, for the public did not come in with selling orders. Much of the decline in prices had no origin in sales; it came about as a measure of precaution lest people should want to turn out stock without there being any support to take what came on offer. Some prices became practically nominal; to buy shares was as difficult as it was to sell them. On this Monday evening, the markets separated with foreboding mingled with resignation. The principal complaint was that no newspapers had appeared since the middle of the day.

Falls in the Electricity Supply section are few and unimportant. The London group is steady. Amongst provincial shares, Newcastle-on-Tyne and Yorkshire Electrics are easier. In the manufacturing market, Johnson and Phillips have been changing hands up to £3, the increased dividend, making 17½ per cent. for the year, being attractive to investors. Electric Constructions are better at 31s. English Electrics, which touched 14s. 3d. on the passing of the dividend, are now up to 16s. 3d. Callender's preference have strengthened. The ordinary were unaffected in price by the announcement of a scrip bonus to be distributed from the company's reserves. It is proposed to capitalise £200,000 and to give to present proprietors one new share for every three shares held. The dividend is again 3s. per share, for the seventh successive year. The bonus forms a substantial present, and the expectation is not unjustified which hopes for a continuance of the 15 per cent. dividend upon the increased capital.

The Ever-Ready Company issued a remarkably good statement, net profits for last year being £44,000 higher than those of 1924. The company declares a dividend and bonus making 25 per cent. in all, against 15 per cent. in the previous twelve months. On this, the price of the shares jumped from 48s. 9d. to 56s. 3d., to react to 51s. 3d. in the malaise of Monday. At the latter price, the yield is over 10 per cent. on the money, allowing for the accrued dividend in the price.

Home Railway stocks are, of course, very flat. Metropolitans, Districts, and the Underground Electric Railways issues gave way sharply. In the last named, a somewhat extensive bull account had become built up during the past fortnight, the £10 and the shilling shares being a popular tip for capital appreciation. The temporary bulls hastened to snatch thin profits, for fear of a general strike, and the prices accordingly came down under the pressure of real selling. The London traction stocks have not changed. The L.C.C. anticipates a net deficiency of £192,500 upon its tramways for the year 1925-1926. Rearrangement of traffic conditions is the only lasting remedy which the L.C.C. Highways Committee can see for meeting the present lamentable state of affairs. National Omnibus shares have declined to 22s. 6d.

The Victoria Falls and Transvaal Power Company announces the starting-up of its new giant power station, 65 miles above Johannesburg. The new plant has a capacity of 20,000 kilowatts, and the company looks to multiply this by three when the whole of the section is completed. Mexican Utilities have strengthened, the gains ranging from 1 to 3 points, upon more cheerful news from the country. It is said, unofficially, that the Mexican Light and Power Company has a scheme under consideration for dealing with the arrears of interest upon its second mortgage bonds, and the unpaid dividends upon its preferred shares.

Automatic Telephones are 1/16 up to 2 7/16. Siemens new shares, 18s. paid, are quoted a little lower at 5s. premium. Babcock and Wilcox gave way to 49s. in sympathy with a general fall amongst iron, coal and steel shares. Radio Corporations had a jump of 15s. to 8¼ on New York buying. The preference remained at 9½. Cable stocks and shares show no variations on the week. A rise in rubber shares became checked by the strike crisis, but the statistical position of the rubber industry has taken a turn for the better, from the viewpoint of the holder of rubber shares, and the market would improve were there to be any public encouragement afforded to it.

The Rugby Radio Station.

An All-British £400,000 High-power Telegraph Station.

By E. H. SHAUGHNESSY, O.B.E., M.I.E.E.

(*Abstract of Paper read before the* WIRELESS SECTION *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

(*Concluded from page* 719.)

Control Table.—The position of the control table can be seen from fig. 4. The slate panel contains all the essential controls and the most important meters of the wireless transmitter.

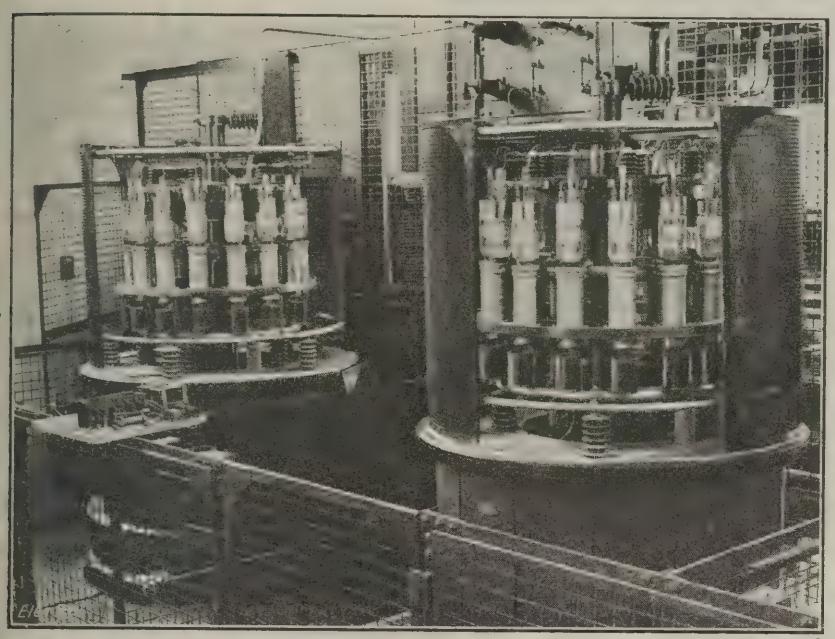

Fig. 10.—Third Stage of Amplification.

The apparatus terminating the land line from the Central Telegraph Office, London, which controls the transmission from the station, is fitted on the right-hand side of the panel, fig. 12, so that the duty engineer can check the signals passing through the transmitter and also speak to the controlling telegraph office as may be necessary. On the table on the left-hand side of the panel is an "engine-room telegraph" operated by push-buttons to enable the power requirements to be signalled to the power house. A loud-speaker and wireless recorder are provided for checking the actual signals transmitted from the aerial. In addition two press-buttons control a motor-driven variometer in the aerial circuit to compensate for any changes in the aerial constants due to weather, &c. The duty engineer, therefore, has full control of the entire station in detail from his position at the control table.

The high-frequency and other electrical measuring instruments fitted in the valve transmitting plant were supplied by Messrs. Everett, Edgcumbe & Co., Ltd.

Coupled Aerial Circuit.—Any large valve transmitter should be provided with a coupled circuit, since the use of a valve transmitter at reasonably high efficiencies necessitates the production of a certain proportion of harmonics which should be filtered from the aerial. For an "anode tap" the use of capacity rather than inductance brings with it a reduction of the harmonics in the aerial in the ratio of $1/m^2$ for the mth harmonic; that is, types B and D are m^2 times better than types A and C respectively, fig. 13.* For preliminary tuning, the use of capacity rather than inductance brings with it the disadvantage of having to be tapped in relatively big steps instead of being continuously variable as with an inductance; but, within these steps, variations of coupling between the primary circuit and the antenna circuit will produce equivalent changes in the adjustment of the complete circuit. Similar arguments apply to the method of coupling the primary circuit to the antenna circuit; that is, as regards the undesirable emission of harmonics, type E circuit is m^2 times better than type D, and therefore m^4 times better than type C. The ideal circuit, therefore, from the point of view of harmonic emissions is that shown as type E with capacitative coupling to both anode and aerial. In practice, however, it would be expensive to provide a range of condenser values for both anode and aerial couplings which would cover all the large and small adjustments required during the experimental period of tuning up the plant. If, however, a type D circuit is used with a condenser having a relatively coarse adjustment for the anode coupling and a continuously variable inductive coupling for the aerial, all necessary adjustments for the preliminary testing can be made with facility; then when the constants of the aerial circuit are known and the preliminary tuning has been completed, if necessary the change to type E can readily be made. It has, however, been found unnecessary to depart from the type D circuit installed.

The mica condensers, fig. 9, immersed in oil, were made by Messrs. Dubilier to meet the Post Office specification. They have a power factor of 0.00025 at the working frequency; the primary circuit is designed to carry 630 amperes, and at this current the value of the r.m.s. voltage applied to the condenser would be 33,000 volts (peak value 46,500 volts) and the kVA 20,800. Actually at present the value of the working primary current is about 300 amperes.

At the time the designs were being prepared the practical manufacturing limit as regards number of strands in a cable was 6,561 ($=3^8$) and calculations indicated that the diameter of the coil should be great and the diameter of the wire used should be very small. It was, therefore, decided to use a cable of 6,561 strands of No. 36 S.W.G. wire for both the primary and aerial inductances, each strand being insulated by enamel and one covering of cotton or silk. The cables were made to the Post Office specification by Henley's Telegraph Works, Ltd.,* and Messrs. Connollys, Ltd. The maximum current-carrying capacity of this cable when wound into an inductance is probably of the order of 1,000 amperes. The cable is mounted on a framework of American whitewood,† wound in slots on movable wooden spiders which are supported by rollers on a wooden framework, so that changes

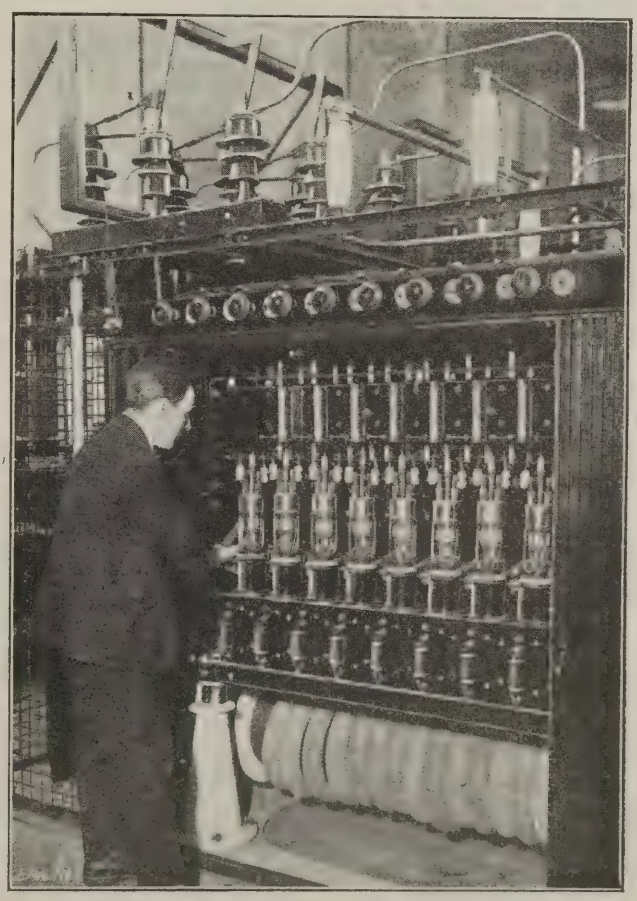

Fig 11.—One of the Power Valve Units (Gates open).

* Taken from a paper being prepared by Mr. R. V. Hansford and Mr. H. Faulkner for presentation to the Institution.

* See ELEC. REV., November 20th, 1925; p. 831.
† See ELEC. REV., July 10th, 1925; p. 61.

of inductance can be obtained by the relative movement of the spiders without the awkward mechanical construction of "tapping points" and the disadvantages of "overhanging" end-turns. The maximum width of the largest inductance coil is 14 ft. 6 in.

One outside spider can be moved by a screw in order to get a fine adjustment of tuning. The method of making a joint in the stranded wire between the spiders is to splay out the strands on a number of insulated flat copper plates and semi-conical copper fittings so as to ensure proper circulation of current through all the strands and to keep a cool joint.

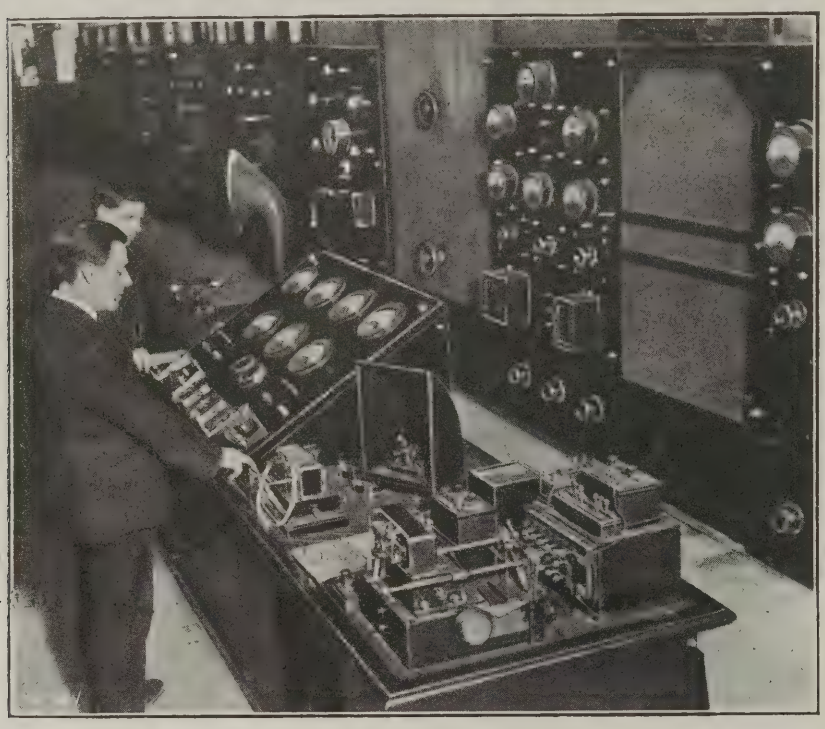

Fig. 12.—Telegraph Control Desk ; Land-line Terminal on Right.

The actual measured resistance at 16,000 cycles of the entire primary circuit as erected was 0.088 ohm, giving a decrement of 0.0053. The measured resistance of the aerial tuning inductance and coupling coil (2,500 μH) at 16,000 cycles was 0.11 ohm, giving a decrement of 0.00137 for the coils, and the author has not noticed details of any transmitting inductance which is as efficient as these have proved to be.

Keying and Shape of Signals.—One of the greatest difficulties is that of successful keying; as a result of experiments it was decided to provide for the simultaneous operation of a simple "make and break" key at each of the three points in the circuit marked x in fig. 7. The system has proved to be eminently satisfactory and Creed pneumatic keys are used at points *a* and *b* and a magnetic relay at point c. There is no oscillation in the aerial when the key is "up" and this result is obtained by breaking the feed to the grid from one stage of amplification to the next, as shown in fig. 15, which is a skeleton diagram of the last inter-stage circuit. Two points of particular interest in the arrangement are, first, that the key splits the coupling condenser to the grid and leaves the condenser E between the grid and filament when the key is up; this condenser is of sufficient value to make the impedance from grid to filament capacitative, and this counteracts any tendency that this stage may have to self-oscillate. The second point of interest is the series circuit A B C from grid to filament; A is merely a high-frequency choke, B is an adjustable resistance (grid leak) and C is a d.c. (grid bias) generator. When the key is down the mean negative grid potential is the sum of that due to the grid leak and the generator; when the key is "up" the only bias is that due to the generator. By adjusting the proportions of the bias due to grid leak and generator respectively when oscillating, it can be arranged that the generator voltage is sufficient to allow a suitable d.c. current to pass through the valves when the key is up. The advantages of this are that (1) the d.c. load with "key up" reduces the voltage "kick" on the generator with keying, and (2) the conductive path through the valve (due to the small grid bias) increases the damping of the aerial when the key is "up," with a corresponding improvement in the shape of the signals.

From oscillograms of the aerial current the decrement of the aerial circuit for the rise of current has been calculated as 0.0086, whilst for the decay it is as high as 0.024; for higher speeds, advantage will be taken of the quick decay by decreasing the length of the "space" relatively to the "mark" and means for doing this are being developed. This method of keying is due to Messrs. Hansford and Faulkner, whilst the whole of the work of erecting and assembling the internal wireless plant was done by Post Office workmen under the supervision of, and to the detailed designs of, Post Office engineers. The tuning-fork units were made in the Post Office experimental workshop at Dollis Hill.

Masts.—The masts are 820 ft. in height from ground-level to the top of the antennæ aerial sheave and are of the stayed and pivoted type. The pivot is about 17 ft. above ground-level; below this are columns of porcelain insulators and a granite cube (5 ft. 6 in. sides), the whole being supported by a steel columr The total weight of steelwork in a mast is 170 tons and the weight of the 15 stays is 28 tons, and stay anchorages, &c., 12 tons. Under maximum wind load the resultant vertical load on the base of the mast is 400 tons.

The insulation is primarily provided by 12 columns of porcelain insulators arranged three in each column between steel castings immediately below the pivoted joint. The insulators will withstand a high-frequency voltage of 25,000 (r.m.s.) at 50,000 cycles per sec. for 6 hours without overheating or breaking, having first been immersed in water for 2 hours. They were tested mechanically to a compression load of 270 tons; each is 9 in. in diameter and 3¼ in. thick, with a recessed hole in each face 2½ in. dia. and 1 in. deep.* Their arrangement permits of the insertion of 3 hydraulic jacks to raise the mast and replace faulty insulators as required.

The stays are insulated at the base only, and a hydraulic press is incorporated in the stay-rope attachment which can be used to measure directly the tension of the stay.

The stays are of parallel strand construction and were made

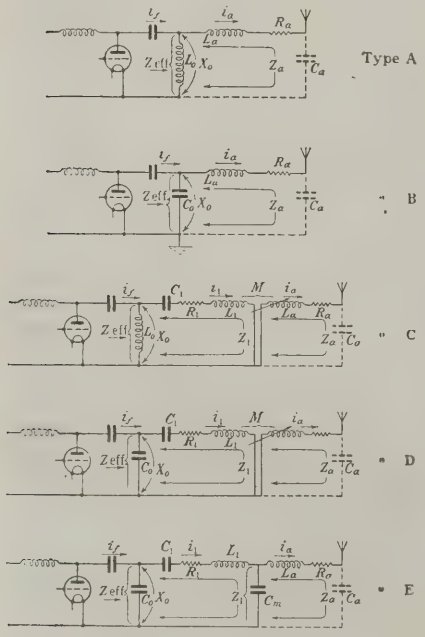

Fig. 13.—Types of Output Circuits.

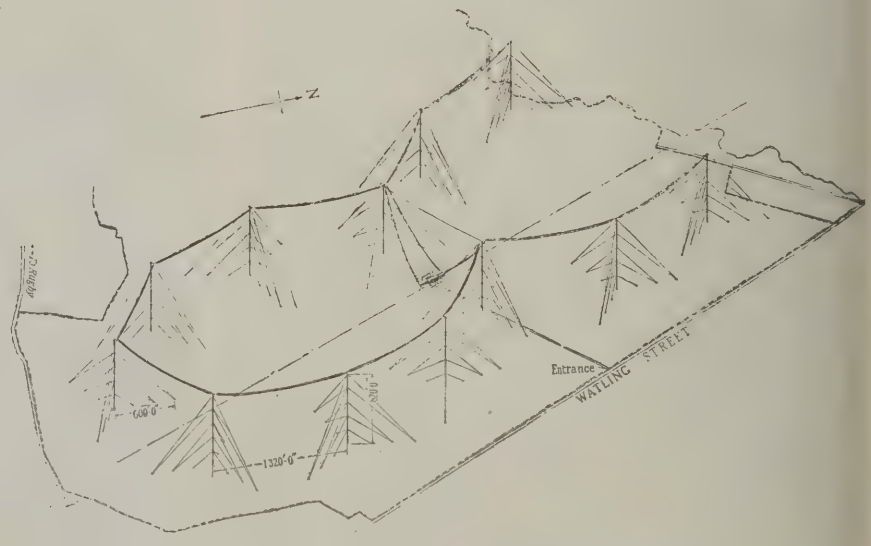

Fig. 14.—Isometric View of the Station.

* See ELEC. REV., July 10th, 1925; p. 60.

on the site. The larger is composed of 151 wires of No. 10 S.W.G., having an area of 1.918 sq. in. and a circumference of 5½ in., and this type of stay has a great advantage over the usual small wire stranded variety in possessing a smaller extension under load.

The masts were manufactured and erected by Messrs. Head Wrightson and Co., and switches are provided for earthing the masts when access to them is required and also for enabling transmission to be carried out at full power with the masts earthed. A spark-gap is also associated with the switch as a protective device against abnormal voltages on the masts or aerial.

Aerial System.—Two separate aerials of different capacities may be used, or the two combined to form one larger aerial

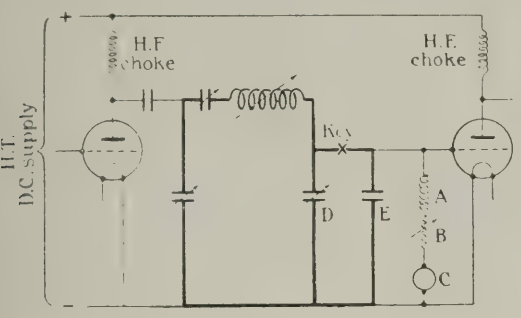

Fig. 15.—Inter-stage Circuit.

(fig. 14). The larger of the two is the telegraph aerial and forms an elongated octagonal figure in plan, with sides of 1,320 ft., but with opposite sides on axes at right angles at distances apart of 880 and 1,200 yards. The smaller aerial open arms arrangement is designed to permit of the addition of four more masts if necessary. The aerial insulators are of the porcelain-rod tension type, weighing 6½ cwt. and each will withstand a pull of over 20 tons and 200,000 volts at 50,000 cycles per second across the ends without damage. They were made by Messrs. Bullers, Ltd. Spider spreaders of tubular steel, 12 ft. in diameter and spaced 140 ft. apart, support the eight 7/14 S.W.G. silicon-bronze wires that form the cage aerial. The split hubs of each spreader are tightly clamped to a central steel supporting cable. The tension of the lead-up wires is taken by 6 porcelain tubes, similar to those used in the main aerial insulators, suspended on a steel structure near to the building, fig. 16, the steel rope supporting the aerial insulators passes down the centre of the mast and is attached to a drum fitted with a slipping friction brake so adjusted that the rope is slackened when the load exceeds 10 tons.

The earth system on the telegraph site consists of copper wire, 100 lb. per mile, buried a few inches below ground, and follows the plain of the aerial and extends 800 ft. on either side. Near the buildings the wires leave the ground and converge upon the transmitting room in a fan arrangement (fig. 17).

An insulated counterpoise has been erected under the smaller aerial at an average distance of about 16 ft. from the ground, following generally the earth system in arrangement.* The ratio of the effective height of the aerial with the masts earthed is 1.22. At 19,000 m. wave-length the aerial resistance with masts insulated is 0.7 ohm, and with the masts earthed it is 0.55 ohm. The use of inefficient insulators for masts practically doubles the aerial resistance, *i.e.*, when the porcelain insulators are short-circuited and the granite blocks alone are used as insulators.

The resistance of the blocks steadily rises as the granite slowly dries out. The effect of the dielectric current in the granite is to drive out moisture gradually from the interior; this action, combined with absorption by the atmosphere in the spring and summer, will raise the insulation to a maximum value, and the granite blocks will then be completely coated with a bitumastic solution to retain them in a dry state.

Results Obtained.—Below are two typical series of measured values of the more important quantities when working on one portion of the aerial only, *viz.*, that having a capacity of 0.33 μF.

Number of power units in use		3	3
Total number of valves in power units		54	54
Aerial circuit	Current	550 amps.	600 amps.
	Power	257 kW.	306 kW.
Primary circuit current		275 amps.	300 amps.
Coefficient of coupling to aerial		0·015	0·015
Efficiency of coupled circuit		97½%	97½%
D.C. input	Voltage	5,820 volts.	6,780 volts.
	Current	61 amps.	64 amps.
	Power	355 kW.	434 kW.
Filament power		48 kW.	48 kW.
Efficiency of transmitter	Excluding filament	72%	71%
	Including filament	64%	64%
Voltage on antenna		165,000 volts.	180,000 volts.

The above figures are for about two-thirds power of the station, and the present limitation is the fact that only a portion of the main aerial is available, which is already being used at antenna voltages in excess of 165,000 volts. With this power, however, the station has been proved to have a world-wide range and only the collection and scrutiny of data over a long period will show to what extent, if any, an increase of power is necessary for a *continuous* world-wide service. From the experience already gained it can be predicted that, if it is proved to be necessary, 3-power units using a d.c. supply of about 9,000 volts will give an antenna current of the order of 750 amperes in the larger antenna of 0.045 μF, with an increased overall efficiency.

During the several months that the station has now been testing and working commercially with type D circuit, not a single complaint has been received with regard to interference with broadcast or other reception by harmonics from the telegraph transmissions.

Experimental Telephony.—The experimental telephony installation works with the smaller aerial, and the American Telephone and Telegraph Co.'s "single-side band" system described by the late Dr. H. W. Nichols.* The modulating and filtering circuits and the valve amplifying panels were made and installed by the Western Electric Co., Ltd., in co-operation with the American Telephone and Telegraph Co.

Experimental tests show that good speech is received in New York during most hours of the day when using an aerial current of about 185 amperes. This installation may form the subject of a separate paper when reliable data has been collected over the period of bad atmospheric conditions. In addition, two other installations to work with smaller aerials supported on the existing masts are being provided. One will be a medium-wave 50-kW valve set and the other a short-wave 15-kW valve set.

Discussion in London.

Mr. L. B. TURNER presided and opened the discussion by reading a communication from Dr. W. H. ECCLES, who commended the excellent team work of the Post Office engineering staff; they had been responsible for the design and development of unusual forms of plant and circuits and the best testimonial to their work was the station's magnificent performance. Its erection had been completed without failure, fault, or accident, and the estimates were very close to the final expenditure.

SIR GUY WRIGHTSON, of Messrs. Head, Wrightson & Co., who supplied and erected the masts (which have formed the subject of an Institution of Civil Engineers' paper) said that their erection had been carried out in one of the wettest and windiest seasons that he remembered without accident.

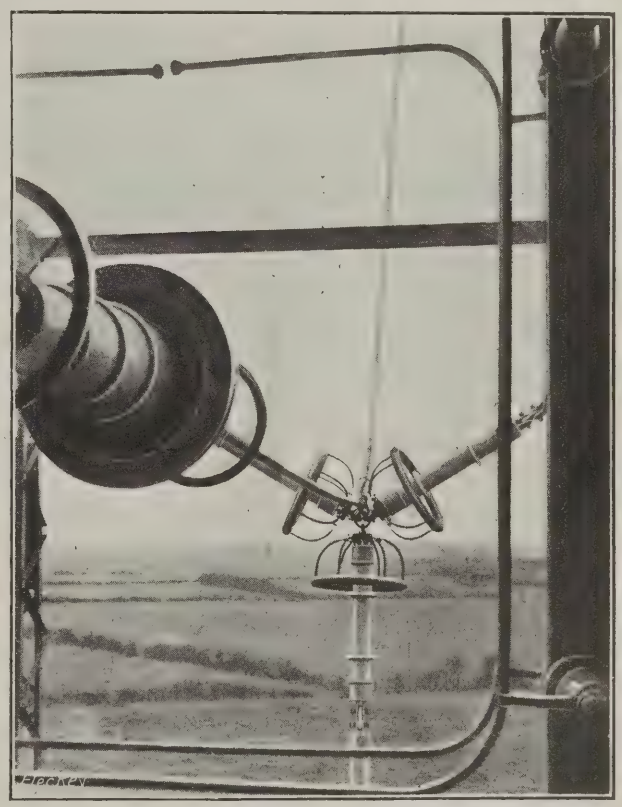

Fig. 16.—Aerial Lead-in.

Mr. C. ELWELL wanted to know whether it was necessary to provide so many masts. No engineering difficulty would be encountered in erecting even higher masts than those at Rugby, nor in providing for a much greater aerial pull, say, 30 tons, in which case the masts could be double the distance apart. With regard to valves, personally, he favoured the use of a smaller number of larger size, because the maintenance factor of many small ones was unknown. Large valves could have their filaments renewed.

Capt. P. P. ECKERSLEY envied the Post Office engineers' ability to erect a station of that size wherever they liked without the consent of anybody, but his envy was changed to admiration when it was realised that the telegraphic plant operated without seriously interfering with the broadcast wave-

*The counterpoise has since been buried.—EDS.

Journal, I.E.E., 1923, vol. 61, p. 812.

band; telephony was another matter. He congratulated those concerned on having built the station on a solid engineering bases, and admired the manner in which the Meissner patent had been overcome. The application of a tuning fork represented a unique advance in methods of maintaining wavelength constancy; the British Broadcasting Co. had experimented in that direction and had used tuning forks for independent drives; starting with 890 cycles it had been possible to drive a relay station at a frequency of nearly one million cycles. Many valves made for safety, but would it not have been more economical to have used less expensive mast insulation and a little more power?

Mr. H. N. Vivian felt that the Rugby station was the last word in two respects; it was the best of its type ever built and he believed it would be the last. In a short time the "beam" stations would prove whether that opinion was sound or not.

Mr. E. H. Shaughnessy, in reply, remarked that the long-wave stations in Germany and France were still doing very well and there was no indication that they would be scrapped. The Post Office knew something about short waves, including the fact that they did not behave the same from day to day and a telegraph service was of little value if it were not reliable. If manufacturers would not repair large valves, the Post Office would have to do it.

Radio Measuring Instruments.

However casually the average engineer may be inclined to regard "wireless," contemplation of the Rugby station can hardly fail to arouse enthusiasm for the achievements of the radio engineer, and especially is the General Post Office staff to be congratulated on having built a station costing about £400,000 and containing only £1,000 worth of foreign apparatus. Even the heaviest of heavy-current engineers must be impressed by the provision of 1,000-ampere radio ammeters with which to measure the flow of the high-frequency current to the oscillatory system. The electrical measuring instruments for the valve transmitting plant were supplied by Messrs. Everett, Edgcumbe & Co., Ltd., and a brief survey of the more interesting types employed may not be without interest as indicating the care that has been taken to meter the energy needed to operate the station. The switchboards controlling the supplies of a.c. at 100 cycles for filament lighting, and the high-voltage d.c. for the anodes, in addition to the low-pressure d.c. for various auxiliary purposes, are equipped with "Superscale" instruments.

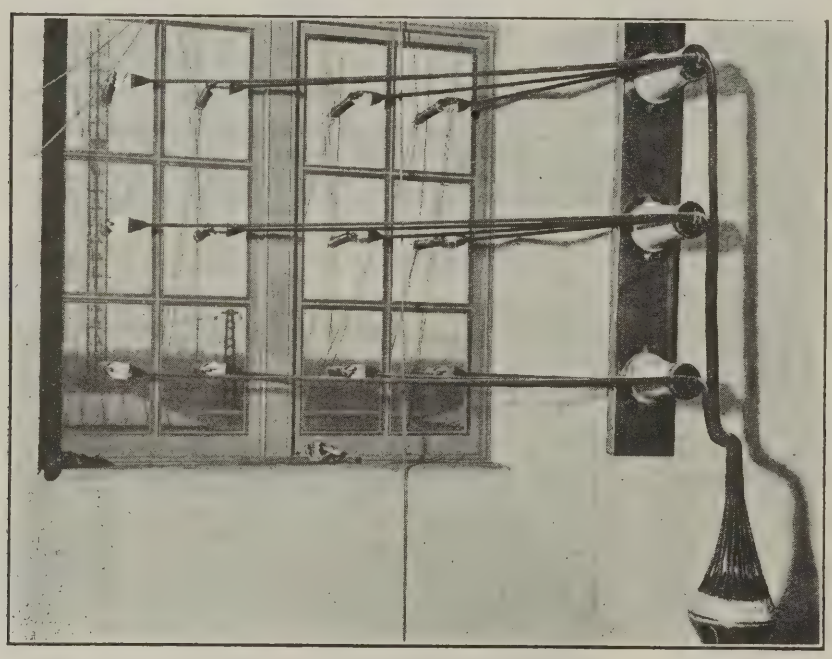

Fig. 17.—One of the Earth Leads-in.

An interesting feature is the mounting of a specially designed electrostatic voltmeter on each pair of motor-driven main generators; each instrument is mounted on an insulating pillar on the top of its machine, and is calibrated, with both poles insulated, to read the total voltage of each pair of generators, *i.e.*, 6,000 volts. When the generators are in series a specially developed tank type of voltmeter is used for measuring the full anode voltage of 18,000 volts. It consists of a "Superscale" milliammeter of the moving-coil pattern connected in series with a high resistance contained in an oil-filled porcelain tank, and arranged to pass milliamps. per thousand volts across the terminals, the milliammeter being calibrated in kilo-volts to correspond. The resistance tank is placed high up in a place of safety, since it necessarily has the full potential across it and the instrument may be seen in the centre of the bottom row on the control desk (fig. 12). The filament current of the valves is continuously recorded on "Inkwell" ammeters; the total valve hours worked by each bank can thus be readily ascertained by integrating the chart readings and information as to constancy of supply is easily obtainable. In addition to the cooling-water flow-meter, d.c. "Superscale" instruments indicate the grid and anode filament currents and a third ammeter (designed to carry both d.c. and a.c.) indicates the oscillatory component of the anode filament current. The last-mentioned instrument, a considerable number of which pattern is in use in the station, is worthy of description: The indicating portion of the instrument consists of a thermal-expansion ammeter designed to ensure accuracy at any frequency. An important factor in this respect is the actual current passed through the indicator, and being transformer operated, the latter can be adjusted to work with any current value considered desirable. A figure of 2 amperes was chosen to allow the use of a working element sufficiently thin to be negligibly affected by skin effect, even up to several million cycles per second, and yet sufficiently robust. A current of 2 amperes, further, is sufficiently large to render any parasitic currents induced in the connecting leads negligibly small by comparison. Another consideration is the importance of avoiding the formation of an inductive loop of any size, by the disposition of the internal wiring and terminals; this possible source of error has been avoided by the use of tubular concentric terminals which project from the back of the instrument, and to which the connecting leads from the transformer secondary are joined. The latter are constructed of separately enamelled copper flex, similar to that used in the tuning inductances of the station, the twin insulated conductors being parallel to one another in an external braided covering; both the impedance and the tendency to collect induced parasitic currents are less with this arrangement than with the more usual type of twisted lead. At Rugby, the radio-current transformers are connected directly between the various sections of the oscillatory circuits, the instruments themselves being placed on the control panels and main control desk, sometimes as much as 80 ft. away from their respective transformers. The advantages of this method of measuring large high-frequency currents, as compared with the usual type of directly connected thermal instruments, can readily be appreciated and the transformers themselves have a transformation accuracy well within 0.5 per cent.; although they involve the use of iron cores, thereby greatly reducing their bulk, they have been supplied to work in circuits operating at frequencies as high as 5,000,000 cycles per second. The cores are built up of thin laminated silicon steel, overwound with the secondary winding, the size of wire being so chosen that the required turns exactly fill either one, two, or three complete layers. No gap or uneven winding is permissible, since any variation of the secondary linkage will inevitably cause local leakage of magnetic flux, and thus local heating of the iron. At the higher radio frequencies, even a dozen stray lines will cause sufficient heating of the iron to damage the insulation, the normal working flux density, in such a case, ranging from 0.5 down to 5 gauss at the lower frequencies.

The core and secondary winding (which is of toroidal form, to secure immunity from stray fields) are housed inside the primary winding, which consists of a spun-brass or copper sheath, thus further protecting the secondary from the effect of external fields. The primary current enters by a tubular conductor, passing through the centre of the wound core; it then returns, first, by way of the copper sheath, flowing radially in all directions, and finally through a second tubular conductor, concentric with the first; the whole, in fact, corresponding with a "one turn" current transformer. At high frequencies, however, the use of the iron core makes one turn adequate for currents as low as 10 amperes, such a transformer being only a few inches in diameter and weighing under 1 lb., whilst a 1,000-ampere transformer weighs about 10 lb.

A number of transformer-operated instruments may be seen both on the panels in the valve room, and in the top row of the main control desk (figs. 4 and 12), the capacity of the latter instruments being from 500 to 1,000 amperes of radio-frequency current.

Another instrument of an unusual nature is installed close to the main control desk. It is an electrostatic voltmeter of the attracted-disk pattern, adapted for use as a peak voltmeter; by comparing this reading with the r.m.s. voltage, some idea of the crest factor can be obtained. The peak voltage is measured by connecting a highly insulated condenser in series with a two-electrode valve across the lines. Owing to the non-return action of the valve, the condenser becomes charged to a pressure equal to the maximum value impressed on it, *i.e.*, the peak of the pressure wave. This voltage across the condenser is measured by the electrostatic voltmeter, which thus indicates the peak voltage. An important proviso is that the leakage across the voltmeter and condenser must be very small. It is, of course, the peak of the wave which tends to leak away, and a leakage amounting to, say, 0.2 per cent. of the half wave would represent about 2 per cent. off the peak. Long porcelain supports are used for this voltmeter which has ranges of 10, 20 and 40 kV.

In conclusion, our indebtedness to Mr. F. E. J. Ockenden, who made a special study of the problems involved, for the above details must be recorded.

A Steam-Electric Cotton Mill.

The Rishton Victoria Spinning Co.'s Modernised Plant.

THE ceremonious inauguration of the modernised cotton mill of the Rishton Victoria Spinning Co., Ltd., near Blackburn, took place recently. The installation is of an interesting kind, consisting of a steam turbine driving the spinning mill direct by ropes and the weaving shed electrically; it has been specially designed so that the stopping and re-starting operations at meal times can be effected in the shortest time without difficulty.

It is believed to be the first plant of its type to be commissioned in that district and is an example of what can be done to bring the power plant of old mills up to date in order to meet modern conditions, without having to shut down the mill for a long period.

The original plant consisted of a double beam engine of 900 i.h.p., built in 1860, which drove the spinning mill by spur gearing and an upright shaft; also a horizontal engine for driving the weaving shed through bevel gears. Various schemes for conversion to modern driving were considered, including reciprocating engines and electric driving, but eventually it was decided to install a geared steam turbine and condensing plant with combined rope and electric drive, as shown in fig. 1, the order for the plant being placed with Messrs. W. H. Allen, Sons & Co., Ltd., of Bedford. An important factor was the necessity of keeping the machinery running during the change-over; this was effected by, first, installing the turbine and rope pulley in a small space between the mill chimney and the mill and alongside the existing beam engine house, and the spinning portion of the mill was driven by ropes from the turbine.

The old beam engine and upright shaft were then dismantled and the alternator for driving the weaving shed was erected and coupled to the turbine. Motors were installed in the weaving shed, commencing at the far end, one motor driving three cross shafts, the reduction in speed being effected by double helical wheels. When the last cross shaft was coupled up, the old weaving-shed engine was dismantled. The plant drives 40,000 spindles direct by ropes and the electric motors drive 852 narrow looms and 268 sheet looms; an unusual feature of the drive is that the motors have been arranged to start with the alternator, thus eliminating individual starting and loss of time as referred to above. The alternator and motors were supplied by the Electric Construction Co., Ltd., of Wolverhampton, and the wiring was carried out by Messrs. Adams and Co., of Manchester.

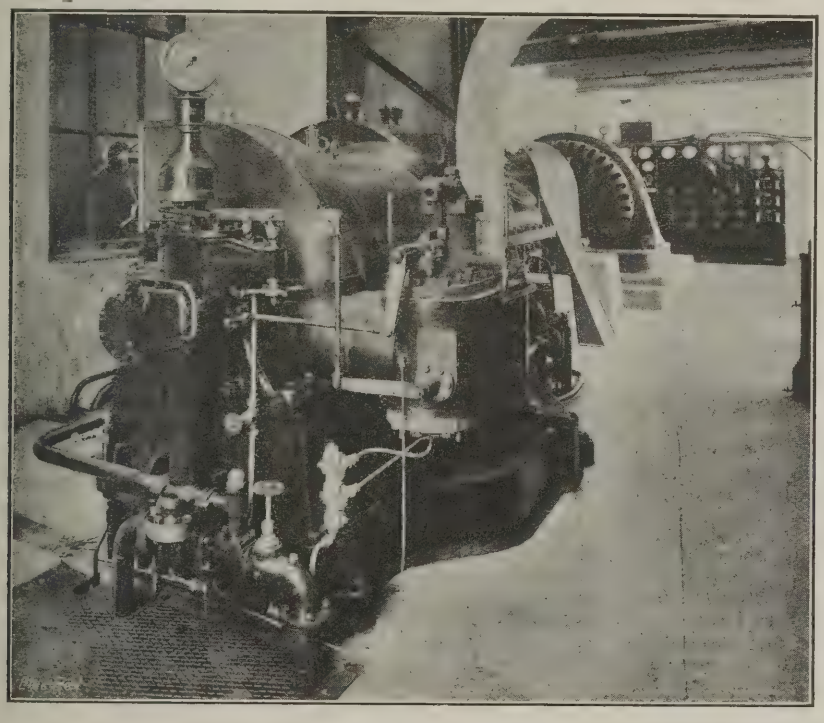

Fig. 1.—Cotton-Mill Steam-Electric Plant.

Provision has been made for the turbine to drive an additional load, if required for future extension, the total available power being 1,750 b.h.p. The boiler pressure is 160 lb. per sq. inch with steam superheated to 65 deg. F. The turbine runs at 4,800 r.p.m. and is geared down to 500 revolutions, while provision has been made for a portion of the steam to be utilised for heating purposes after it has developed power in the turbine. The exhaust steam from the condenser air pump is utilised for heating the boiler feed water before it enters the economisers. Arrangements have been made to enable the turbine to start quickly under vacuum; it requires only two minutes to attain full speed. Apart from the increase in production that the new plant yields, the cost consumption is much lower than that of the old plant.

In conclusion, we are indebted to Messrs. W. H. Allen, Sons and Co., Ltd., for placing the above particulars at our disposal.

A Meter-Testing Laboratory.

A Visit to the Outside Department's Premises of the North Metropolitan Electric Power Supply Co.

ON Thursday of last week Sir James Devonshire, K.B.E., the chairman and managing director of the North Metropolitan Electric Power Supply Co., received and welcomed a number of engineering representatives of manufacturers and other electricity supply undertakings at an inspection of the premises of the outside department of the company at New Southgate.

The company carries out with direct labour the whole of the necessary underground extensions to its super-extra-high, high and low-pressure systems, requiring the laying of some two hundred miles of cable per annum. The work is carried out under the supervision of a mains superintendent and an assistant engineer, and a permanent staff of 37 men, including three foremen, 10 jointers and jointers' mates, and 14 labourers. Owing to the extensive area in which the company operates, it is not practicable to carry a larger staff of permanent labourers, but an average of 200 casual labourers are employed, these being drawn, as far as is possible, from the districts in which extensions are carried out. A fleet of five motor lorries and a 12-ton six-wheel cable carriage provide for the transport of materials for the four gangs normally employed.

The maintenance of the super and extra-high-pressure mains is carried out by the permanent staff of the mains department, the maintenance of the overhead lines being dealt with by a linesman and a mate. The pressure testing of the low- and high-pressure mains is carried out by means of suitable portable step-up transformers. The super- and extra-high-pressure mains are tested by means of a portable 2-tube Kenotron apparatus, made by Messrs. Watson & Sons, and designed for a maximum pressure of 200 kV. The recording of all the mains extensions is carried out in the outside department drawing office, a senior and four junior draughtsmen being employed on this work.

The department was formed in 1921 to control the stores, mains and meter departments of the company, the accommodation consisting of a three-storey private house (No. 15, Friern Barnet Road). The rapid increase in the company's activities had rendered the original accommodation inadequate, and separate buildings have been erected at the rear of the house, which now provides office accommodation only for the stores and mains departments.

All materials required by the company's district undertakings are stocked in a two-storey building, 72 ft. by 33 ft. A third but independent floor above this building accommodates the central offices, where the accounts for the whole of the company's consumers, about 24,000, are dealt with. The feature of the premises, at least from the technical point of view, is the meter department's building which has recently been erected. This consists of a single-storey building divided into four sections, receipt and dispatch room, workshop, testing laboratory, battery and motor generator room. Immediately on delivery all meters are permanently marked with a serial number in the first-mentioned portion, to which they are returned after being dealt with in the laboratory. The workshop contains the necessary bench accommodation and apparatus for the complete overhaul of all types of meters, separate benches being devoted to each type. The battery and motor-generator room contains a 4-cell 800-Ah Tudor battery and a 3-unit motor generator, consisting of a 2½-h.p., 3-phase motor driving a 600-V, 1-A, d.c. generator and one of 10-V, 100-A rating.

The laboratory is perhaps the reverse of what has been conceived as the up-to-date test room, and its conspicuousness lies in the absence of complicated and elaborate instruments. Those responsible for the lay-out of the department have obviously gone out for simplicity throughout—and with it efficiency. Methods of testing have been adopted which ensure, without loss of accuracy, the necessary speed to cope with over 10,000 meters per annum. If permissible, the term "testing by mass production," might be applied. The bulk of the meters are tested against rotating sub-standard meters which, with other standard and sub-standard instruments, are accommodated on a separate standards bench. Test racks and benches for dealing with the different types of meters are placed in the usual manner throughout the room, and all connections between the benches and racks are run in ducts below the floor.

Two methods of testing single-phase Wh meters are employed, one, in which a tapping key controls both the current and potential of the testing circuit and the standard meter, is allowed to rotate x revolutions; the angular displacement from zero of each test meter disc is then read on a gauge, which gives direct readings of the percentage inaccuracy. In the second method the tapping key controls the sub-standard meter only; this is run during x revolutions of each meter under test,

the percentage error being calculated from the sub-standard disk reading. The polyphase meters are tested against a standard double-element dynamometer-type wattmeter. Other types of meters are tested by modifications of the usual testing methods.

For collecting data concerning different types and makes of meters, samples are tested at various temperatures in a small electrically-heated oven with a glass front and suitable terminal arrangements. This oven is also used for the desiccation of transformer oil and dielectric samples. An important branch of the work done in the test room is in connection with breakdown tests on transformer oils. A special panel is provided for this work at one end of the laboratory. A h.p. supply is obtained from four 100/10,000-V potential transformers connected in series, and the control is effected by means of a phase shifter, one secondary of which is connected in opposition to the corresponding phase of the supply. This phase shifting apparatus is also used in connection with the testing meters on unbalanced circuits.

The supply of energy for the premises is taken from a sub-station adjacent to the stores building which supplies the company's local networks in New Southgate and Friern Barnet. This sub-station is fed through two feeders from the company's 11,000-volt system, terminating in B.T.-H. compound-filled truck-type switches.

In supporting Sir James Devonshire at the reception, Captain Donaldson, the company's chief engineer, paid a tribute to Mr. G. F. Shotter, the meter superintendent, who is responsible for the entire lay-out of the apparatus in the testing laboratory.

Tramways and Light Railways in 1924-25.

Annual Return.

As we have reported, the annual return of tramways and light railways (street and road) and railless trolley undertakings for 1924-25 has been published,* somewhat later in the year than the previous one.

The return covers the year 1924 in the case of company undertakings and the twelve months ended usually in March, 1925, in the case of municipal undertakings.

The statistics relate to 242 tramway undertakings, 170 owned by local authorities. During the period covered, the system of the Keighley Corporation was wholly converted to railless traction; and the Dearne District Light Railways Joint Committee commenced operations. Out of a total of 2,792 route miles authorised, 2,605 miles was open for traffic; 1,859 miles was worked by local authorities and 746 miles by companies. The total length of track in operation amounted to 4,381 miles.

The number of passengers carried during the period was 4,620,501,521, equivalent to 1,772,711 journeys per mile of route open. The car-mileage amounted to 378,239,229; of this 99.59 per cent. was worked electrically. The figures show that, as compared with the preceding period, the number of passengers carried increased by about 177,000,000, and the car-mileage by approximately 15,000,000. There was a slight decline in the efficiency of use of electrical energy; the total consumption was 707,038,431 kWh, giving an equivalent of 1.88 kWh per car-mile, as compared with 1.87 kWh in 1923-24. The average fare paid per passenger fell from 1.53d. to 1.47d.

The traffic receipts and expenditure of the undertakings is analysed in a table. From this it is seen that the gross receipts per car-mile declined from 19.46d. to 18.23d.; and the gross working expenses from 15.13d. to 14.43d., leaving net receipts of 3.80d. as compared with 4.33d. in 1923-24. The alterations were particularly marked in the case of company undertakings in which the receipts fell from 20.87d. per car-mile to 17.70d., and the expenses from 16.10d. to 14.20d., reducing the net receipts from 4.77d. to 3.50d. per car mile. The municipalities' net receipts were 3.87d. per car-mile, as compared with 4.23d. in 1923-24.

The amalgamated capital accounts show that the amount invested in municipal undertakings at the end of the period was £75,737,982 and that the companies' capital expenditure was £20,211,615, giving a total investment of £95,949,597.

In comparing the revenue statistics it is necessary to eliminate the amounts paid by lessee to lessor undertakings. With this adjustment the gross receipts amounted to £23,957,179 in the case of local authorities, and £4,780,460 in the case of companies, giving a total of £28,737,639. The working expenses were as follows:—Local authorities, £18,896,573; companies, £3,836,582; total £22,733,155. The 1923-24 totals were:—Receipts, £29,433,647; working expenses, £22,847,032. From these figures it will be seen that the ratio of working expenses to receipts rose from 77.74 per cent. to 79.10 per cent. As a further comparison it may be mentioned that this ratio was 76.23 per cent. in 1922-23, and only 64.51 per cent. in 1913-14. The net receipts for 1924-5 were £6,004,484 and sundry additions brought this up to £7,368,080; these additions included aid from rates amounting to £521,801. On the other hand, the allocations included £281,732 to the relief of rates; £2,057,442 to interest and dividends; £1,644,816 to debt repayment; £536,144 to income tax; £1,916,485 to reserves; £130,724 to capital works charged to revenue; and other charges making the total £7,173,412, and leaving a balance of £194,668 to be carried forward.

In accordance with the usual practice the 176 undertakings have been grouped into six classes according to their financial results. In Class I, comprising undertakings which showed a credit balance for the year, after meeting all charges in full, there were 99 undertakings—one more than in 1923-24—showing a combined balance of £419,708 as against £404,101 in the preceding year. Undertakings in Class II, after meeting all charges, made reserves in excess of the amount available; there were 6 of these as compared with 9 in 1923-24, but the combined debtor balance increased from £42,600 to £108,824. In Class III—undertakings which met interest and capital redemption but failed to cover income tax and other charges in full—there were 15 undertakings, against 11, and the aggregate adverse balance was £38,342, as compared with £17,056. Twenty undertakings (Class IV) were unable to meet their capital redemption charges (as against 22) and their total deficiency was £46,394, as against £46,435. In Class V, comprising systems that were unable to pay interest charges in full, there were eight undertakings, as against 5, the total debtor balance rising from £87,789 to £296,437. Eight undertakings (Class VI) were unable to meet their working expenses by an aggregate of £212,618 (as against £136,067). The total result was an overall debtor balance of £282,907, comparing unfavourably with a credit balance of £74,154 in 1923-24, and even more so with a balance of £223,103 in 1922-23.

The statistics of railless trolley undertakings are given in separate form. During the period reviewed 13 local authorities and one company actually carried passengers; 20 local authorities did not exercise their powers. Six undertakings appear in the return for the first time, *viz.*, Ashton-under-Lyne, Croydon, Lowestoft, Manchester, Oldham, and St. Helens Corporations. The total route-mileage in operation was 57.48 (local authorities 54.57 miles). The number of passengers carried was 24,261,748 and the number of car-miles run 2,670,562. The operating ratio was 84.40 per cent. in the case of the municipalities, 95.09 per cent. for the company (Mexborough and Swinton), and 84.43 per cent. overall. A table giving the results of the undertakings in pence per car-mile for five years shows that a remarkable improvement occurred during the year under review. While the income rose from 14.09d. to 14.27d., the expenses were reduced from 12.96d. to 12.10d., raising the net receipts from 1.13d. to 2.17d. per car-mile. The net receipts of the municipal undertakings averaged 2.23d. per car-mile, while those of the company undertaking were 0.67d. The detailed statistics show that the amount expended upon railless trolley systems at the close of their respective periods was £365,829 in the case of municipal authorities and £16,911 in the case of the company.

The revenue during the year was £152,335 for municipal undertakings and £6,411 for the company, and the expenditure was £128,567 and £6,096 respectively, giving balances of £23,768 and £315. Four local-authority undertakings were unable to meet their working expenses, incurring an aggregate deficit of £3,571. The total available in the case of municipal undertakings was £27,189. Against this were charged interest, taxation, &c., totalling £28,055, leaving an adverse balance of £866. The largest of the undertakings—the Teesside Railless Traction Board, with a capital expenditure of £85,269—not only met all charges but was able to contribute £4,695 to the relief of rates and to put £1,500 to reserve. It must be stated, however, that the undertaking made no provision for loan repayment or interest. The combined municipal undertakings carried 23,267,561 passengers at an average fare of 1.56d., and operated 2,557,172 car-miles.

*Stationery Office, 15s. net.

Scientific and Industrial Research Report.—We have received a copy of the Second Report of the Adhesives Research Committee of the Department of Scientific and Industrial Research, price 3s. net, postage extra. It covers the period of three years since the Committee's first report appeared in 1922, and contains an interesting account of the work of that body. A clear step forward in the study of the chemistry of gelatin has been made by the production of a gelatin of very high purity. The product differs very little in this respect from ordinary high-quality glues. A method has been elaborated for the extraction of high-grade gelatin from bones in a far shorter time than has hitherto been possible, and should prove of practical value. But an achievement which should have important economic results is the development of a method of extracting an *odourless* and *tasteless* gelatin of high adhesive value by simple treatment from fish skins. Investigations designed to throw light on the fundamental nature of adhesion have been undertaken, and have already enabled some tentative conclusions to be drawn as well as indicating the uses to which particular adhesives are specially suitable. It has also been demonstrated that, provided a small amount of heavy loading material, such as lead sulphate, is incorporated in the glue, which does not materially affect the strength of the joint, X-rays may form a valuable means of detecting flaws in joints in finished structures. Finally, research has been continued on the utilisation of castor bean residues, together with colouring substances and fillers such as sawdust, in the manufacture of plastic materials. Tiles taking a high polish and suitable for flooring have been produced, and use has been found for the adhesive in the manufacture of water paints and distempers.

The Electricity (Supply) Bill.

The Proceedings in Committee.

STANDING Committee C of the House of Commons began consideration of the Electricity (Supply) Bill on April 27th. Sir Robert Sanders was in the chair.

On Clause 1, which proposes to set up a Central Electricity Board, consisting of a chairman and seven other members appointed by the Minister of Transport, Mr. Attlee (Limehouse, Lab.) moved an amendment which, he said, would pave the way for a further amendment which stood in his name, and which had as its object the substitution of the Electricity Commissioners for the proposed members of the Board. He said that in the Bill, the Electricity Commissioners were to be in a *quasi*-judicial position. In a number of cases disputes would have to be decided eventually by the Commissioners, and the feeling had been expressed in various quarters that under the Bill, the Electricity Board and the Electricity Commissioners were not sufficiently distinct to allow of the Commisioners acting in a judicial manner towards the operations of the Board. The two were regarded, in fact, as semi-detached, and not wholly detached. The Labour Party thought that, as the Bill was drafted, it was impossible to disconnect the Board and the Commissioners, and in a later amendment the Labour Party would propose another tribunal altogether. If it were accepted that some other tribunal should be set up, it appeared to be unnecessary to continue to have two distinct bodies, the Electricity Board and the Electricity Commissioners. Therefore his first amendment would make the Commissioners and the Board one body. The Labour Party held that if their view were adopted, the whole of the Bill would be enormously simplified and a clumsy duplication of authorities would be got rid of.

SIR DOUGLAS HOGG, the Attorney-General, said that although the Government were most anxious to accept any amendments that would tend to improve and simplify the Bill, they could not accept Mr. Attlee's amendment. In the first place, the Electricity Commissioners already had, under the Act of 1919, very complicated and responsible duties to perform, which demanded a body mainly technical in character. All the Commissioners but one, who was a man of great financial experience, were electrical experts. That did not, in the view of the Government, constitute the sort of body which they desired or thought suitable for performing the functions entrusted to this Board. The Government view was that the Board ought mainly to be a Board of wide financial and business capacity, although, no doubt, some knowledge of electrical matters might be of assistance. If the Government were to seek to put on the Commissioners all the duties imposed on the Board under the Bill, they would be imposing on them a task far greater than they could adequately perform.

Mr. A. GREENWOOD (Nelson and Colne, Lab.) expressed the perturbation which the proposed Board gave rise to in the minds of the members of the Labour Party. So far as he knew, this would be the first time in history that a nondescript body of business men would have very direct control over local authorities.

Mr. G. BALFOUR (Hampstead, U.) pressed the Attorney-General to give his views on a number of amendments of the same type which appeared on the Order Paper, as did also Sir F. Hall and Mr. Hartshorn.

SIR D. HOGG said if it was the wish of the Committee that they should have a discussion on the composition of the Board, he was quite willing to make a general statement. The functions of the Central Electricity Board would be to carry out the main scheme of the Bill, which was to lay down main transmission lines, and to determine where electricity could most suitably and most economically be generated. Under the clause, as drawn, the Government had deliberately left the composition of the Board not too precisely defined. It was not too much to say that the successful constitution of the Board would be almost the decisive factor in the operation of the scheme. The Board was entrusted with wide powers and with very responsible duties, and it was essential to get the most suitable men, whoever they might be and wherever they might be found. If the Committee desired it, the Government would have no objection to providing in the Bill what certainly would be done whether it was provided in the Bill or not, that before the Board was actually nominated the Minister would consult representatives of the various interests affected. The Government recognised that the Board ought, of course, to avail itself of any assistance which the Electricity Commissioners could render. Under the Bill as drawn the Board had power itself, when once it was functioning, not only to delegate to committees certain powers—which he hoped it would exercise freely towards the general electricity authorities and bodies of that kind—but to set up consultative expert committees which would advise it on technical matters. On Clause 4 the Government would be prepared, if the Committee thought it right, to suggest that, instead of the Board's framing a scheme and submitting it to the Electricity Commissioners for their approval, the Board should frame a scheme in consultation with the Commissioners. That would probably accelerate the preparation of a scheme. If the Commissioners were to sit as an appellate tribunal on the scheme, it would be difficult to advise on its framing. The Government hoped that the relations between the Board and the Commissioners would be friendly, but they did not intend that the Board should cease to exist and that the Commissioners should be put in its place. The Government did not propose to accept a series of amendments designed to destroy the Board as an executive body and to turn it into a purely judicial tribunal. Such a proposal cut at the whole framework of the Bill. It would be a mistake for the Board to be an elected body, but it should be, as the Commissioners were, a nominated body.

Mr. Attlee pointed out that Clause 4 provided for the hearing of parties to a scheme, but before whom would they be heard if the Commissioners were to be also responsible for the scheme?

SIR D. HOGG said that the Government proposed to substitute an appeal to the Minister of Transport from the scheme as constituted by the Board in consultation with the Commissioners. The Government thought that a tenure of office of five years was the minimum for a member of the Board, and there would be power to re-appoint any member at the end of that period. He felt that not less than five years and not more than ten years, would be a workable compromise. The Government was not prepared to debar a member of the House of Commons from sitting on the Board. Debates showed that there were members of the House who would be eminently desirable members of the Board. The Government had decided that there should not be representatives of various interests on the Board. It was not intended that each interest should nominate an individual for membership of the Board. He did not think it would be desirable to exclude a person from membership on the ground that he was directly or indirectly interested in the supply of electricity. For instance, if they were able to get Mr. Samuel Insull, of Chicago, to sit, he would be very sorry to find him disqualified because of his interest in electricity.

SIR JOSEPH NALL (Manchester, Hulme, U.) pressed the Attorney-General for further information as to the appeal which he had suggested from the Board. It now appeared that after the Commissioners and the Board had initiated a scheme, the parties interested would have a right of being heard, but by whom? By the Commissioners who initiated the scheme. They could then appeal to the Minister of Transport, who, presumably, when he heard the case, would have the Commissioners present with him. Could it be seriously contended that that was an appeal within the ordinary common practice adopted in this country?

SIR J. MARRIOTT took the same view, and SIR C. WILSON urged that the Board and the Commissioners should be consolidated, as there was not the slightest necessity for the two bodies. One competent body should be appointed which would have a fair chance from the State of being successful in its object.

After further debate, in which Mr. HARMSWORTH (Isle of Thanet, U.) and Mr. GROTRIAN (Hull, U.) urged the creation of an impartial appeal tribunal, Sir D. HOGG said that he did not think it was intended to lay down by Clause 1 that the Electricity Commissioners were to become a judicial body, or anything like it. It certainly never had been the intention of the Government, or of anybody connected with the scheme, that there should not be an effective appeal, and, of course, the suggestion that the Minister, after the Board had consulted with the Commissioners and prepared a scheme, should then consult the Commissioners as to whether the scheme should be approved would be a travesty of an appeal, and would also be a travesty of what he was going to propose on reaching Clause 4. He deliberately did not elaborate the appeal, but the suggestion would be that, just as under the 1919 Act, when the Commissioners had prepared a scheme it went up to the Minister for confirmation and the Minister decided, not in consultation with the Commissioners, because, if there was an appeal from their decision, they could not be consulted as to the hearing of the appeal, so, when there was an appeal under Clause 4 in regard to any scheme, there should be appointed by the Minister some appropriate person to hear everyone's objections. But every time one multiplied the hearing of the appeals, with expert witnesses, learned counsel, and the other paraphernalia of a judicial hearing, one added enormously to the costs which so far as the Board was concerned, would have to be borne by the consumers in the long run. A multiplicity of hearings and re-hearings, too great a delay, and too great an expenditure, would kill the scheme. With those qualifications, he was perfectly content to consider, when Clause 4 was reached, what was the best and most practicable way of creating an appeal in which the Committee would have full confidence. On the present amendment of Mr. Attlee's, the Government must adhere to the view that it was essential that there should be a Central Board, as well as the Commissioners.

The Committee then adjourned.

When the proceedings were resumed on April 29th, Mr. R. S. HUDSON, the Unionist member for Whitehaven, said that since the previous meeting of the Committee a number of members had been trying to find a way out of their present difficulties with regard to an appeal. There was a general feeling that there ought to be some form of an appeal tribunal. Discussion in the Committee would be simplified if it could

be borne in mind that there were two stages in the life of the Board. The first was the forming of the scheme, and the second was the administering of the scheme, and the relations between the Board and the Commissioners were not necessarily the same at both stages. It would shorten discussion if the Committee would regard the first four clauses of the Bill as forming a whole, and discuss on them the relations of the Board and the Commissioners during the first stage, and leave the relations between the Board and the Commissioners in the administrative life of the Board to a subsequent discussion. If that met with the approval of the Committee and the Government he would suggest that the Government should undertake, when Clause 4 was reached, to agree to the positions of the Board and the Commissioners being reversed—that the Commissioners, the technical people, should form the embryo schemes and that they should publish them, and that the Board should then hold a hearing and become a Court of first instance, giving an opportunity for all the interested parties to put forward any objection to the schemes. The Board, after hearing all parties, would then make such alterations in the scheme as it thought fit, and would publish the scheme. There should also be some kind of small appeal tribunal, which would hear only appeals from persons who considered that their interests had been prejudicially and unreasonably affected by the scheme adopted by the Board. It should not be allowed to consider anything that would have the effect of destroying any fundamental principle of the scheme, because it could not be expected that men of the eminence of those who would compose the Board, would, after drawing up a scheme, submit to the over-riding of that scheme by some appeal tribunal.

Sir D. Hogg agreed that the functions of the Board could be properly looked at in two different stages. He had had communications from more than one member of the Committee making suggestions with a view to meeting the difficulties which some members had indicated last time, and he was grateful to them and to Mr. Hudson for trying to discover some amendment which would not render the Bill unworkable, and which, at the same time, would meet the difficulties of getting some kind of appeal which would be speedy and cheap. He thought that in Mr. Hudson's suggestion there was at any rate hope of a successful solution. If Mr. Hudson and those associated with him would be good enough to frame the precise amendment which they suggested, he would be prepared to consider it favourably when Clause 4 was reached. As for Mr. Attlee's amendment, if Mr. Hudson's plan were to be adopted it would be necessary to reject that amendment, which, indeed, would pave the way towards the nationalisation of the industry, which the Labour Party desired.

In the discussion which followed, Sir C. Wilson (Leeds, Central, U.), announced his intention of supporting Mr. Attlee's amendment, as he was opposed to Mr. Hudson's suggestion, and Sir J. Marriott (York, U.) declared that he declined to be frightened by the bogey of Socialism, and, in the absence of a definite assurance from the Government that a judicial appeal tribunal should be set up, he would also support the amendment.

Lt.-Col. Ashley, the Minister of Transport, agreed that it would be better for the Board to have the final say in the scheme, and not the technical experts. The Government was perfectly willing to consider favourably the suggestion that the Bill should be turned round, that the Electricity Commissioners should frame the scheme—which they were eminently suited to do with their long experience and distinguished service—and that the Board should then consider the scheme and receive representations from those people who thought that they were adversely affected by it. Previous to that, the Board would, of course, have published the scheme. Then, those who considered themselves adversely affected financially by the scheme should have that the right of appeal from the Board to an independent tribunal. Such a proposal would, he thought, meet all the legitimate objections of those who wanted the Bill to go through. All that the Government desired was that there should be an independent appeal tribunal which would inspire confidence.

Mr. A. Greenwood (Nelson and Colne, Lab.) accused the Government of capitulating to those very interests which it had declared it would stand up against, and of letting down the local authorities.

Mr. G. Balfour (Hampstead, U.) regarded with favour the Government's new suggestion as to appeals.

Mr. Mardy Jones (Pontypridd, Lab.), in supporting Mr. Attlee's amendment, declared that the Commissioners, with their large technical knowledge, should remain as the nucleus of any Board that might be set up. He agreed that there should certainly be some form of appeal tribunal.

Mr. Hardie (Glasgow, Springburn, Lab.), asked some some assurance that the Board should not get into the hands of the business "sharks."

In view of the concessions which had been made by the Government, Sir C. Wilson intimated that he would withdraw his support from the amendment.

Mr. Attlee's amendment was defeated by 50 votes to 17.

Mr. Grant (Derby, S., U.) moved an amendment to provide that the Chairman of the Board should be "an experienced lawyer." Sir D. Hogg resisted the amendment, in view of the fact that the Board was to be entrusted with very important business functions. After discussion, the amendment was withdrawn. The Committee then adjourned until Tuesday, May 4th.

(To be continued.)

Czecho-Slovakian Imports and Exports.

The December issue of the monthly foreign trade returns of Czecho-Slovakia contains in a summarised form certain details of the imports and exports of the country for the twelve months of 1925. From these, the following figures relating to electrical material have been extracted, the corresponding statistics for 1924 having been added and notes of increases and decreases given. It will be noticed that imports of heavy apparatus are considerably greater than exports.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

The "Heatrae" Electric Water Heater.

Figs. 1 and 2 show a domestic hot-water supply tank and a bath-water heater which have recently been introduced by MESSRS. ELECTRIC FIRES, LTD., King Street, Norwich. The domestic tank is fitted with a ball valve, operating in an entirely independent valve chamber. The water chamber is well lagged and enclosed in an outer casing, and a suitable overflow pipe and draw-off tap are provided. The heating apparatus consists of a small constant heater and a separate booster heater, the latter being of the combined switch and immersion-heater type, if desired, so that the whole is self-contained. The tank is made in capacities of from 10 to 30 gals., with constant and booster loadings of from 200 and 2,000 W to 300 and 4,000 W respectively. The bath-water heater consists of a

Fig. 1.—Domestic Hot-Water Tank.

Fig. 2.—Bath-Water Heater.

specially designed, unlagged, cylindrical copper tank. The cold-water inlet is taken to the top of the tank, the inlet pipe being fitted with a water control valve. The feed-water arrangement is such, it is claimed, as not to allow the water to syphon back in the event of the water supply failing, and provision is made on the outlet pipe to prevent dripping whilst the water is heating up. The loading is 4 kW and the capacity is from 5 to 15 gals. Both heaters are finished in white sprayed enamel.

A New Design of Tumbler Switch.

We have received from MESSRS. "M.K." ELECTRIC, LTD., Wakefield Street, Edmonton, N.18, a sample of a new tumbler switch, fig. 3 ,which they have recently placed on the market. The design is on the general lines of the makers' foot-press switch, used in connection with electric fires, and can be supplied in the surface, sunk and semi-sunk types. The rated

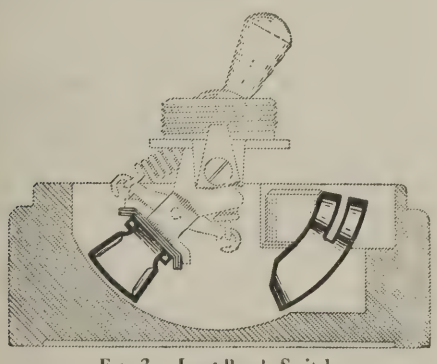

Fig. 3. Long-Break Switch.

capacity of the switch is 5-7 A and its special design and exceedingly long break renders it capable, it is claimed, of making and breaking four times that capacity Two tripping links, actuated by the dolly irrespective of the spring movement, give the contact arm a positive action throughout its entire stroke. A quick-make and-break action is transmitted by a strong flexible spring. The contacts are of phosphor bronze and the insulation is of pure mica which is specially treated to prevent surface leakage when installed in damp places.

The "Domestic" Electric Water Heater.

The accompanying illustration, fig. 4, the "Domestic" cistern, is one of a range of such apparatus which has been placed on the market by MESSRS. INVENTUM ELECTRICAL APPLI-

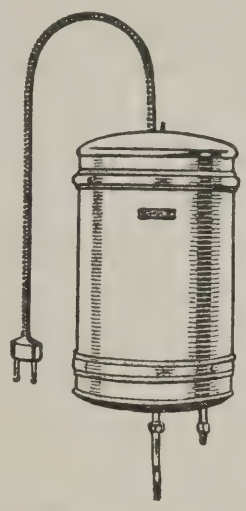

Fig. 4.—"Domestic" Water Heater.

ANCES, 124, Chancery Lane, London, W.C.2. The elements are of the electric-iron type encased in a tinned-copper sheath from which they can be withdrawn without emptying the tanks. The outer casing is of galvanised iron, while the inner casing or tank is constructed of tinned copper and is lagged with shredded cork. The apparatus is fitted with the "Inventum" bi-metallic thermostat (for use on a.c. only) which, it is claimed, can be adjusted to operate at any temperature up to 202 deg. F., the usual "temperature drop" allowed between "cutting" out and in being 10 deg. F. The capacity of the cistern is 1.5 gal., and the loading is 500 W. The range includes apparatus with capacities up to 22 gal. at loadings up to 500 W. A feature of the appliances is that the whole of the working parts can be removed, it is claimed, in 5 min., and the interior easily cleaned of scale and deposits, this possibility enabling a higher water temperature to be maintained.

A Non-Metallic Electric-Heating Element.

We have received from THE BRITISH RESISTOR CO., LTD., 32, Clare Road, Halifax, some particulars of a non-metallic element, "Globar," which they are introducing into this country. "Globar" resembles in appearance silicon carbide and the elements are usually manufactured in the form of round rods, ranging from 3 to 60 in. long, and from ¼ to 1 in. in diameter. The material is claimed to be unaffected by gas and chemical fumes and to have practically no coefficient of expansion, enabling liquids to be poured over the elements when operating at high temperatures. It is also claimed that the material does not decompose under temperatures of 3,000 deg. F. and that the material is being commercially used in electric furnaces for working temperatures up to 1,350 deg. C. The terminal portions of the elements are specially treated for increasing their conductivity. A variable characteristic of the material is its change in resistance through use, but it is claimed that this can be made negligible or entirely compensated for by the correct design of the apparatus.

A Car-Lighting Fitting.

THE LODGE FITTINGS CO., LTD., 57, Albert Road, Aston, Birmingham, has sent us a sample of its "Classic" car-lighting fitting, fig. 5, which has recently been put on

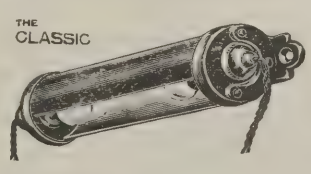

Fig. 5.—Car-Lighting Fitting.

sale. The device is designed as a trough lighting unit and accommodates a small b.c. lamp at each end. The trough is arranged as a revolving shutter so that the light can be focused to the most convenient position. The shutter is held at any position in the two end "caps" by virtue of its own spring, and it can be revolved by slightly pressing its centre at the edge. The device is contained in a suitable bracket which is fixed in the desired position by means of two screws. The inside of the shutter acts as the reflector and is silver-plated. The other parts are oxidised.

Parliamentary News.

[By Our Special Parliamentary Reporters.]

Damage by Electric Wires.—On April 27th, Major Ruggles-Brise asked the Minister of Transport whether he was aware of certain contingencies which might arise, causing injury to persons, buildings, fences, crops, or stock during or after the erection of above-ground transmission lines or other electric lines.

Colonel Ashley said that owners and tenants of private land were safeguarded by the existing provisions contained in Section 22 of the Electricity (Supply) Act, 1919, and he did not consider that further provisions were necessary.

Fuel Economy.—On April 27th, in reply to questions by Mr. Hannon, Lord Eustace Percy said that research on the economical utilisation of fuel was being carried out under the Fuel Research Board of the Department of Scientific and Industrial Research. An account of the work in progress was given in the Report of the Royal Commission on the Coal Industry (Chapter IV), and fuller information would be found in the annual reports of the Fuel Research Board and of the Department of Scientific and Industrial Research.

P.O. Power Station at Taunton.—On April 27th, Lieut.-Colonel Gault asked the Postmaster-General whether he was aware that an independent power plant was being installed by his department at Taunton, where there was already an efficient and cheap public supply of electricity available with an adjacent main from the Taunton Corporation; and whether, in the interests of national economy, he would reconsider the erection of this plant and make use of the power generated from the existing system.

Sir Wm. Mitchell-Thomson said he was aware that arrangements were being made to install an independent electric generating plant in the new telephone repeater station at Taunton. It was essential to equip repeater stations with a complete electrical power unit, for use in emergency. At the smaller stations, such as that at Taunton, it was more economical to provide a second power unit and thus make the station self-contained, than to install the special plant which would be necessary to utilise energy from the public supply.

Wireless Experiments with America.—On April 27th, Sir A. Sinclair asked the Postmaster-General whether His Majesty's Government refused to conduct experiments in wireless telephony with either Australia or Canada on account of its commitments in the United States of America; and if so, whether he would explain the nature of these commitments and how long they would last.

Sir W. Mitchell-Thomson said that the only reason why the experiments had so far been confined to the United States was that the United States was the only country equipped with suitable transmitting and receiving apparatus for the purpose of reciprocal experiments. The Government was under no obligations to the United States which would preclude its undertaking experiments with Canada or Australia in the event of stations equipped for the purpose being provided in those Dominions.

Electricity Meters.—On April 29th, Viscount Sandon asked the Minister of Transport whether he would consider the desirability of taking power to safeguard the consumer by inflicting penalties on electricity companies where the meters were faulty and recorded excessive readings, and by inspection of these meters.

Colonel Ashley said he did not propose to suggest an alteration in the existing law on this subject, which, in his opinion, already adequately safeguarded the interests of the consumer.

The Doncaster Corporation Bill.—This Bill, which includes a clause giving the Corporation certain powers with regard to the wiring of houses and the supply of electrical fittings, was to come before a House of Lords Committee on May 3rd, but was adjourned *sine die*. We are informed that there is no opposition on the part of the Electrical Contractors' Association.

Legal.

Alleged Mercurial Poisoning.

At the Birmingham County Court, on April 28th, before His Honour Judge Ruegg, Lucy E. Goffe, Gravelly Hill, claimed for compensation, under the Workmen's Compensation Act, against the Birmingham Corporation, in respect of the death of her husband, Richard Goffe, on February 24th. He was employed as a meter repairer in the Electric Supply Department, and the applicant's contention was that his death was due to an industrial disease, namely, mercurial poisoning. Respondents contended that death was due to natural causes. Mr. Ward (counsel for applicant) said Goffe was 22 when he died, and his dependants were a widow and one child. He was in the employ of the Corporation for seven years, and it was in respect of the last two years that it was alleged mercurial poisoning was set up. During that time he was employed to inspect electricity meters in houses and factories, and possibly to clean them when it was required. These meters contained mercury, and before he was engaged on this work Goffe was strong and robust, but afterwards he complained of headaches, depression and internal pains. A local practitioner was called in, and he came to the conclusion that Goffe was suffering from poisoning in some form. Counsel described Goffe's symptoms as time went on, and said his wife had seen him remove small pellets from his hair and clothing. Paralysis and death ensued. A post-mortem examination was made by Professor Haswell Wilson, two days after the death, but no traces of mercury were found in the body at that time. Certain of the organs were sent to Mr. Rigby, an analyst, who then found traces of mercury in the liver, the kidney and the spleen. In the other parts of the body he found no traces. Counsel's submission was that although the final cause of death was myelitis, that myelitis was brought about by mercurial poisoning. Professor Morrison said death was due to myelitis, and no mercurial poisoning was present, his reason for saying this being that there was no change in any organ such as would be produced by chronic mercurial poisoning. Professor Haswell Wilson, Professor of Pathology at Birmingham University, who made the post-mortem examination, said he found no evidence of mercurial poisoning. His Honour, after consulting the medical referee, said that the matter would require careful consideration, and judgment would be reserved.

Marconi's Wireless Telegraph Co., Ltd., v. Pearl's Bargain Stores.

In the Chancery Division, before Mr. Justice Astbury, on April 28th, Mr. Trevor Watson moved for judgment in the case of Marconi's Wireless Telegraph Co., Ltd., against Pearl's Bargain Stores. Counsel said that this was a patent action. A defence was delivered, but it contained no particulars, and an order was made for particulars which had not been complied with and in consequence there was no defence. He therefore asked for judgment in the ordinary form—an injunction delivery-up, and an inquiry as to damages.

His Lordship gave judgment accordingly.

British Electric Vehicles, Ltd.

Mr. Justice Romer, in the Companies' Winding-Up Court, on April 27th, made an order for the compulsory liquidation of British Electric Vehicles, Ltd., on the petition of Batteries, Ltd.

Counsel for the petitioners said that they were creditors for £429 for goods supplied. There was no appearance for the respondent company, and no opposition.

Correspondence.

Correspondents should forward their communications at the earliest possible moment. ***No letter can be published unless we have the writer's name and address in our possession.***

British Goods Handicapped in Australia.

Being a comparative newcomer to Australia, there are one or two points I would like to bring to the notice of your readers. I have been in the electrical industry in London, Birmingham, and Manchester, and am naturally an enthusiast for British goods, and have found no difficulty in selling them against foreign makes. The majority of native Australians are not enthusiastic, and I think these are some of the reasons. There is a general feeling that America leads on manufactured goods, due to the advantage gained during the "drugged and doubting years" 1914-1917; the American representative is not slow to take advantage of this. Even worse, a representative of the B.E.A.M.A., writing in one of this week's trade journals, talks of unrelieved gloom in the electrical industry at "home." Would you give an order to a traveller who said his company was nearly bankrupt? Another point: Why do reputable English manufacturers give their agencies to men who have no sympathy with British trade? Very often a good agency is run in conjunction with Japanese goods, or even Belgian dolls. The agent very often does not know anything about the goods, and will show an English cast article against an American stamping; when asked to explain the difference in price, "one is English and one American" is all he knows. Does the average manufacturer know how large Australia is and what it can take in electrical goods?

Wake up! Cheer up!

Salesman.

March 25th, 1926.

Three-phase, 4-wire Distribution.

Referring to "Inquirer's" question in your issue of the 23rd ult., perhaps the following remarks may be of assistance to him. I am presuming that his letter referred to a group of three single-phase transformers, and that the actual text, as printed, is in error when it states that "three THREE-phase core-type transformers" were to be connected star/star.

If unbalanced single-phase loads are connected between phase lines and secondary neutral, the star/star-connected bank will not operate successfully unless the primary neutral is connected to the neutral of the generator.

Assuming that a single-phase load be connected between one phase line and the secondary neutral, and that the other

two phases are not loaded, then the current for the load will flow through the neutral line, through the secondary of one phase of the transformer, and through the phase line connected to the loaded phase of the transformer. A load of this kind draws current from only one secondary of the transformer. A corresponding current must flow in the primary winding of the loaded phase. But, when the primary is star-connected, and its neutral is not connected to the neutral of the generator, then the current for the loaded phase must pass through one or both of the other phases. Similar results are produced when the three phases are unequally loaded by connecting single-phase loads of different values between phase lines and neutral. The voltages induced in the phases due to unbalanced load are in addition to the impressed voltages. The resultant voltages produce extra voltage stresses on the insulation, and may produce a high iron loss, which may increase the temperature of the transformer. If the primary neutral (of the transformers, or transformer, if it is three-phase) be connected to the generator neutral, the transformers should operate satisfactorily, provided they are of good design.

W. G. Stuart.

Trethomas, *May 1st*, 1926.

Propeller-type Runners for Hydraulic Turbines.

We have read with interest the article in your issue of April 23rd pointing out the advantages of the Kaplan runner. But are its advantages over other propeller runners worth its high cost, and greater liability to breakdown, due to the necessity of installing a large amount of mechanism in a most inaccessible part of the turbine?

It is true that owing to its higher speed the alternator should be cheaper, but then other factors arise which tend to neutralise this advantage.

It is also true that high efficiencies at low gate openings are obtained, but in practice all large stations have two or more units, and it is therefore not necessary to operate the turbines at their low gate openings.

When considering the Lilla Edet scheme, the Swedish Government engineers thoroughly investigated and tested the relative advantages of the Kaplan and Lawaczeck runners, and the result of their investigations was that one Kaplan and two Lawaczecks were ordered. We believe their main reason in coming to this decision was greater assurance of reliability with the latter.

The first trial run of the Lawaczeck turbine has already taken place, and when tested on a net head of 6.2 metres, this turbine gave 11,000 b.h.p. against a guaranteed output of 9,350 b.h.p. on that head.

The Heating of Buried Cables—Report No. 2.

We are much indebted to Major Taylor for calling attention, in his letter published in your issue of April 30th, to the discrepancy in the formulæ for calculating "K" as between the earlier report in 1921 and the later one as published in the *Journal* of the Institution of Electrical Engineers, Vol. 61, p. 517 *et seq.* In the first report the quantity "Q" was used to represent the heat developed in the whole cable, and was correctly employed in the corresponding formulæ. In revising the symbols for the larger report it was the wish of the Sub-Committee to employ the quantity "H" to represent the total heat in watts developed in each centimetre length of each conductor as set out on p. 534 in the *Journal*. Owing to a regrettable slip the formulæ as previously given for "Q" were not corrected for this different meaning of "H," so that, while formula (23) is correct, "H" should read "2H" in formula (24), and "nH" in formula (25). None of the values of the thermal resistivity given in the report are affected by this *lapsus calami*.

Major Taylor's comments hardly serve to make the matter clear, and his description of a 3 : 1 error as an error of 300 per cent. needs revision, but in view of his letter referring specifically to Mr. Melsom's work and his present absence in America, I, as joint author of the report, beg to offer the above explanation with the approval of the Director of Research.

Printer's errors which escaped correction in the *Journal* occur in equation (58) where "r" should be "R_1," and in equation (37) where "I_2" should be "I^2."

E. Fawssett.

Westminster, *May 3rd*, 1926.

Science Congress in France.—The annual congress of the French Association for the Advancement of Science is this year to be held in Lyons from July 24th to August 1st next. For the last ten years an exhibition of scientific apparatus has been held in connection with the Congress, but as this year's is the fiftieth of the Congress it has been decided to give the display of scientific and technical apparatus a much more comprehensive character. Interested firms can obtain particulars of the exhibition from the offices of the Foire de Lyon, 1, Rue Blanche, Paris.

Reviews.

Junior Technical Electricity. By R. W. HUTCHINSON, M.Sc. Pp. viii + 382; figs. 327. London: University Tutorial Press, Ltd., and W. B. Clive. Price, 4s. 6d. net.

A fair idea of the scope of this book may be obtained from the fact that the first diagram is of a piece of magnetite with iron filings adhering to it and the last is of a three-valve wireless receiving set. The book is issued as a First Year Course in Electrical Engineering for students in Technical Schools and Colleges, and, in view of the fact that no previous knowledge of electricity is assumed, we are inclined to regard the author's estimate of the time taken to cover the course as a trifle optimistic. However, admitting the truth of the adage, "A man's aim should exceed his grasp," and allowing Mr. Hutchinson a certain latitude in his measurement of time and human capacity, we would say at once that he has covered much ground with thoroughness and has struck a good balance in his treatment of the theory and practice of electricity.

There are twenty chapters in the book and the subjects are taken in the usual order, the first five chapters treat of Magnetism and the two next of Electrostatics, while the latter part of the book treats in succession the properties of currents and the phenomena of electromagnetic induction and its application to generators, motors, instruments and telegraphy.

While realising the importance of good electrical conductors few students of electrical engineering gain sound conceptions concerning the properties of magnetic materials and often fail to appreciate the value of low hysteresis losses. It is satisfactory to note that some stress is laid by the author on magnetic properties and the practical applications of magnetism.

We must confess to finding the chapters on Electrostatics a little *dry*, an impression that is intensified rather than diminished by the very free use of *italics* and the frequent changes of type.

The chapters on the magnetic, chemical and heating effects of the electric current are sound and practical. We rather doubt the wisdom of devoting so much space nowadays to arc-lamps, and would suggest that, in view of the greater use of the arc for welding and furnaces, brief reference to these applications would have been preferable to details of arc-lamp mechanisms. Generators and motors are treated in an elementary but useful manner, and there is quite a good concluding chapter on radio communication.

A useful feature of the book is the number of worked examples, and there are also exercises appended to each chapter. Viewing this book side by side with its elder brother "Technical Electricity," we are somehow reminded of a now famous poster in which an emaciated bather contemplates his corpulent reflection in the convex surface of a familiar bottle. But while the addition of the word "Junior" to the title has produced some emaciation it does not seem to have impaired the soundness of constitution of this last addition to Mr. Hutchinson's literary family.

P.H.S.K.

Telephone Communication Systems. By ROYCE GERALD KLOEFFLER, Kansas State Agricultural College. Pp. vii + 284; figs. 213. London: Macmillan Company. Price, 17s. net.

This, the latest manual of the Engineering Science Series, has for its object the presentation of the subject of telephony in a general manner suitable for short college courses in that particular field. In the twenty-two chapters into which the work is divided, the author deals with the transmitter and receiver, magneto and signalling systems; non-multiple, multiple and universal switchboards, intercommunication systems, automatic telephony—Strowger and panel-type—lines, testing, repeaters and multiplex telephony, and radio-telephony.

Detailed descriptions of apparatus and circuits are avoided by selecting typical items illustrative of fundamental principles. Realising the difficulty which many students experience in tracing out complicated circuit diagrams, the author, by the use of partial circuits, leads up to the more complicated complete ones; and although unable, within the limits to which he has restricted himself, to go into too much detail, succeeds in giving the reader sufficient to enable him to obtain a fair grasp of the subject. The volume is fully equal to the other members of the series in the excellence of its illustrations and letterpress, and although written from the American standpoint, will prove a useful book to those whom the author describes as "having to explain communication problems to the public and others."

Turbo Blowers and Compressors. By W. J. KEARTON. Pp. xv + 333, with 152 illustrations, including 7 folding plates. 8½ in. by 5½ in. by 1¼ in. London: Sir Isaac Pitman & Sons, Ltd. Price, 21s. net.

The development of the high-speed electric motor has led to the introduction of many entirely new types of machines for all manner of industrial processes. Instead of being driven either directly by low-speed reciprocating engines or through belts or toothed gearing, the machine can be direct-coupled to the motor, and owing to the high speed of the latter a light, compact, and therefore less costly, unit is obtained. A very good example of this new type of machine is to be found in the turbo-blower and centrifugal compressor—the author does not deal with the reciprocating compressor—and it is this new type of machine which forms the subject of this book. These machines have been developed to take the place of the low-

speed reciprocating blowers, compressors, gas pumps and exhausters, and it is indicative of their recent introduction that this is the first text-book published in this country dealing exclusively with their design, construction and regulation.

The theory of the centrifugal pump is familiar to every engineering student and can be easily understood, but the theory of the centrifugal blower or compressor, which is in reality a centrifugal pump dealing with compressible fluids such as air, coal gas, &c., instead of incompressible fluids such as water and oil, is not so easily explained. The author, however, deals with this part of his subject in his opening chapters in a very direct and concise manner, giving first of all a chapter on the compression of air in which he discusses the usual theories of isothermal and adiabatic compression, entropy, specific heat, and work, all of which are equally applicable to rotary as to reciprocating machines. The problems of the losses inseparable from the centrifugal compressor, the necessity of interstage cooling and the various cooling systems employed, and the efficiency of this type of machine are then discussed, the more theoretical part of the book being closed with a chapter on regulation.

What we may term the second part of the book deals with the more practical problems of design, testing, and operation. In this part the author has described in detail, illustrating his remarks with a number of folding plate drawings as well as smaller detail drawings, of actual machines, these including blowers for blast furnace and cupola work, compressors having eleven or twelve stages, and capable of delivering air up to pressures of 100 lb. per sq. in. and suitable for pneumatic plant as well as exhausters for operating ash suction, and grain suction plants. A useful chapter on the critical speed of shafts is included in this section and while one could suggest that it might rather find a place in a text book on strength of materials, its inclusion is justified by the application of the theories given to the case of high-speed blower and compressor shafts. Another very interesting chapter is that dealing with the turbo-blower as an auxiliary to the internal combustion engine. For the two-stroke engine this type of machine is used for scavenging the cylinder, while for the four-stroke engine it finds its application for supercharging, which is, of course, equally applicable to the engine working on the two-stroke cycle. An interesting application of this is to be found in the aero engine, where blowers driven by exhaust gas turbines are employed to overcome the effects of reduction in the atmospheric pressure with altitude.

It will be realised, therefore, that this book deals very fully with the subject from the point of view of the student and the designer. We would have wished that the author had in one of his preliminary chapters given a brief *résumé* of the various purposes to which the rotary blower for pressures up to, say, 10 lb. per sq. in. and the centrifugal compressor for pressures above this figure have been put, and of their advantages and disadvantages as compared with the reciprocating types. It might also have been of interest if some suggestions could have been made as to the possibilities of further applications and developments of the rotary machines. From the electrical engineer's point of view these have the advantage of requiring the electric motor to drive them—unless, indeed, they are so large that they are direct coupled to the steam turbine itself, as is already being frequently done. But with these reservations we can heartily recommend this book to all those who are interested in this newer and more economical method of compressing gases.

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from April 28th :—

H.G., Horace Green & Co., Ltd., Cononley, Keighley, Eng. (lettering and design). No. 455,001. Class 6. Electric motors and dynamos.—Horace Green and Co., Ltd., Cononley, Keighley.

Permatector. No. 467,806. Class 8. Rectifiers for radio receiving sets.—Brownlie Wireless Co. of Great Britain, Ltd., 310a and 312a, Euston Road, N.W.1.

Miniloss. No. 468,211. All goods in Class 8.—Sterling Telephone and Electric Co., Ltd.

Ceag (lettering and design). No. 453,217. Class 13. Electric lamps, contacts and terminals, fittings, fusible cut-outs, switches, &c., all for use in connection with miners' electric safety lamps.—"Ceag" Miners' Supply Co., Ltd.

Harelda (lettering and design). No. 465,583. Class 13. Electric lamps (ordinary).—Harelda, Ltd., 5, Suffolk Street, Pall Mall, S.W.1.

The L.C.C. Tramways and Street Improvements.—Since the London County Council commenced to operate tramways, in 1899 the undertaking has been called upon to make contributions towards the cost of the widening of streets through which the tramways run, and the annual charge has been in the neighbourhood of £30,000. The Highways Committee considers that the time has arrived when the undertaking should be relieved of a burden which is not shared by other transport systems, except in such cases where the cost of improvement is increased by the special requirements of the tramways. Where improvements are carried out solely on account of the tramways, the cost should be charged wholly or partly to the tramway accounts. A resolution embodying recommendations on these lines was to be submitted to the London County Council on Tuesday last.

Published Specifications.

Compiled expressly for this journal by Patent Agents.

The name of the applicant's patent agent, if any, will be found on the printed specification.

The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

Ourselves and the Emergency.

IN consequence of the General Strike, which lasted from midnight on May 3rd until midnight on May 12th, the weekly trade and technical papers, in common with practically all other publications, were prevented from making their appearance. The ELECTRICAL REVIEW for May 7th had been passed for press, and in that form it was obliged to remain until the Strike was called off and subsequent negotiations between the Newspaper Proprietors, the Master Printers, and the various unions —which extended over nearly four days—were concluded.

Immediately it was known that the issue of May 7th would be delayed, arrangements were made for the preparation of a special Electrical News Summary of four pages to be issued weekly so long as the emergency should last. Accordingly one such Summary was circulated by letter post to regular subscribers, advertisers, and others whose addresses were on our lists, on May 7th, and a second was dispatched on May 14th. It was, of course, impossible for us similarly to meet the requirements of regular readers who purchase their copies through newsagents.

In the present supplementary issue, dated May 14th and 21st, we have endeavoured to cover the principal electrical news that has reached us up to the time of dispatch, and we wish to announce that the full normal issue of the ELECTRICAL REVIEW will make its appearance at the usual time on Friday, May 28th.

The Strike and its Results.

THE passing of the great General Strike, which had been held up before the eyes of the British public as a menace from time to time, was hailed with relief not only by the nation but by the whole civilised world. Its prospective terrors proved, when put to the test, to exist only in imagination, and its ignominious failure to achieve its objects has for ever laid the spectre which haunted the thoughts of our statesmen. It failed simply because the great majority of the British people declined to accept the dictation of a minority, and quietly but with unshakeable resolution determined to "carry on." Perhaps the most noteworthy features of the struggle were the orderly manner in which it was conducted by both sides, and the short duration of the conflict; it was brought to an end before any section of the community had incurred serious suffering and before temper had been aroused—hence it leaves little bitterness behind.

Unfortunately, it cannot be denied that the trade and industry of the country have been severely dislocated, and the ill-effects of the strike will be felt for many months to come; the rising tide of returning prosperity has been stayed for a time, but we hope and believe that the magnificent demonstration of British stability and sanity which has been afforded by the recent events will secure and enhance the confidence of foreign customers. The prestige of Great Britain never stood higher than it does to-day. Despite the loss and inconvenience to which we have all been put, we think the nation will feel that it was a good thing to "get it over" and to be done with the general-strike bogey once for all.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Electricity (Supply) Bill.—Owing to the crisis the consideration in committee of this Bill was postponed. On May 14th the House of Commons in Committee considered the following resolution:—"That it is expedient to charge on the Consolidated Fund any sums required by the Treasury for fulfilling any guarantees or payment of interest or principal on any loans raised under any Act of the present Session to amend the law with respect to the supply of electricity which may be given by the Treasury under the Act."

Several Unionist members criticised the resolution, and Major KINDERSLEY objected to the Committee's being asked to pass a guarantee for £33,500,000. He moved to limit that resolution to a sum not exceeding £10,000.

Mr. RADFORD thought the guarantee unnecessary, and contended that a well-drawn up prospectus, pointing out that the Electricity Board would have a potential monopoly of electricity, would raise the money required at 5½ or 6 per cent., without any Government guarantee.

Mr. G. BALFOUR was convinced that if the Bill emerged from the Committee in its present form the only result of the resolution would be to raise the price of the money which from this time forward had to be employed in the private development of electricity.

Sir D. HOGG, the Attorney-General, said that it was not correct to say that when the Board required £33,500,000 it would be in a position to raise the money on commercial terms on the Stock Exchange. The Board was by its constitution precluded from making any profit, and when it raised money for building its main transmission lines it would have no assets in its possession. There was no question of a monopoly as a money-making concern, but merely a question of a Board formed to discharge a great public function. It was an essential part of the scheme that this guarantee should be given. The Committee by the resolution was only authorising the discussion of the corresponding clause of the Bill when it was reached by the Standing Committee.

The amendment was rejected and the resolution agreed to.

The consideration of the Bill in Standing Committee C was resumed on Tuesday, May 18th.

Imperial Radio-Telephony.—On May 4th, Lord WOLMER, the Assistant Postmaster-General, informed Sir H. Brittain that he had seen a statement that there were stations in Australia capable of radio-telephonic communication with this country, and he had asked the Australian authorities for particulars, stating that, if suitable stations were available, the British Post Office would welcome the opportunity of conducting experiments in radio-telephony between Great Britain and Australia.

Broadcasting.—On May 4th, Lord WOLMER informed Lt.-Commander Kenworthy that the Government had decided to accept in general the recommendations of the Broadcasting Committee as to the constitution of a new authority to control the broadcasting services, and was now considering the method to be adopted to give effect to them.

Electrical Artificers.—On May 6th, Mr. BRIDGEMAN, in reply to questions by Mr. Hore-Belisha, said that over 30 chief and other electrical artificers were at present fully qualified for promotion to warrant electrician and on the roster for promotion. Promotion to the rank was being made as vacancies occurred, but as the number on the roster was amply sufficient to cover any vacancies which were likely to occur in the near future, it had been thought desirable, as a temporary measure, to suspend the examination for promotion until the number on the roster was reduced.

Legal.

Fuller's United Electric Works, Ltd.

IN the Companies Winding Up Court on May 11th, Mr. Justice Romer ordered an adjournment of the petition of Mr. R. H. Symonds, of Albany Buildings, Victoria Street, S.W., for the compulsory liquidation of this company to allow negotiations to proceed for the drafting of a scheme which Mr. Whinney, for the company, said would enable the company to restart business. It was hoped to make arrangements with the debenture holders. Under the scheme further capital would be needed and there was no doubt that that would be obtained.

His LORDSHIP said it sounded as if the scheme might be worth considering.

Theft of Valves.

AT the West London Police Court, on May 7th, before Mr. Ratcliffe Cousins, Ernest Sydney Hunt (35), machine operator, of Richmond, appeared on remand charged with stealing eight valves, valued at £5, belonging to his employers, the M.O. Valve Co., Ltd., Osram Works, Hammersmith. He was arrested a week previously, and 30 other valves were found in his house. The defendant was sentenced to one month's imprisonment with hard labour.—*Richmond and Twickenham Times*

Magneta Time Co., Ltd., v. Stonebridge Electrical Co., Ltd.

IN the Chancery Division, before Mr. Justice Russell, on May 7th, Mr. Bray, for the defendants in this action, said that he had a motion for rectification of the register, and the question was how it should be heard. The Stonebridge Co. were the distributors in this country of electric clocks made by a firm at Zurich. They had not been selling these clocks as "Magneta," except that in one of their catalogues was a photograph of one of the Swiss clocks, on which, if one looked through a magnifying glass, the word "Magneta" could be read. Plaintiffs had commenced an action for infringement in respect of that and for trade libel. The defendants were now applying to meet that by rectification of register. "Magneta" was registered in 1908 by plaintiffs' predecessors, and renewed in 1922, when the original company had been dissolved for five years, the application for renewal being apparently by the agent of the plaintiffs. Invalidity of the renewal would be urged.

Sir DUNCAN KERLY, K.C., explained, for plaintiffs, that the agent did not know of the assignment of the trade mark to the plaintiffs at the time, and omitted to register. A change of address had to be made. The goodwill was sold to plaintiffs and the trade mark assigned to a Mr. X, and then by Mr. X to the plaintiff company. That had been registered, and he (Sir Duncan) was to apply to the Controller of Patents to renew the mark to the plaintiffs, as he had power to do, and that renewal would no doubt be made retrospective.

Subject to Sir Duncan doing that without delay Mr. Justice RUSSELL said he would give him the opportunity of doing it and of giving notice to the other side for the second motion day of next sittings.

Sequel to False Pretences Charge.

AT Old Street, on May 5th, Anatole Ivan Zaitzeff, merchant, Victoria, S.W., was charged on remand "that you, a person against whom a bill of indictment was found by the grand jury at the Central Criminal Court on September 8th for having conspired with other persons to defraud such persons as should be induced to part with goods to N. A. Ludwin and Co. and Importex, Ltd., by false representations, did fail to appear or plead to the said indictment." Mr. Clarke Hall made a committal to the Central Criminal Court, and Zaitzeff appeared before Judge Atherley Jones, K.C., on Monday last.

Lissen, Ltd., v. Pullen.

IN the Chancery Division, on May 7th, by consent Mr. Justice Russell granted an injunction to Lissen, Ltd., restraining Mr. Pullen, Fulham, from infringing its trade mark "Lissenstat" in connection with wireless goods. The defendant had agreed to submit to a perpetual injunction and to deliver up infringing goods.

Reflex Radio Co., Ltd.

MR. JUSTICE ROMER, in the Companies' Winding Up Court, on May 11th, made an order for the compulsory liquidation of this company on the petition of Watson Jones, Ltd., of 235A, Blackfriars Road, S.E., wireless and electrical engineers, creditors for £191 for goods supplied. There was no opposition.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Sports.—We are informed that Messrs. Wm. Geipel's Sports Club Association Football XI had a highly successful season, finishing up champions of the Premier Division of the Harrow and District Football League.

German Cable Works Development.—It is proposed to establish a community of interests between the Isola Works Company of Duren-Birkesdorf and the firm of Karl Heinz and Company of Rodenkirchen. Both works produce similar articles and complement each other in their equipment, while at the same time the Rodenkirchen company has recently brought into operation a modern factory for the manufacture of lead-covered cables.

For Sale.—Southampton Corporation Electricity Works has for disposal one Cole, Marchent & Morley triple-expansion engine with surface condenser, pumps, &c., direct coupled to a 1,000-kW Dick, Kerr d.c. generator. Mr. H. J. Shaw will sell by auction, on June 1st and following day, at the Westmoreland Petrol Station and Garage, Norwood Road, Herne Hill, S.E., 150 1-kW electric rotary converters, 25 electric motors and dynamos, a quantity of electric lamps, 1,000 inert cells, wireless sets, &c. (See our advertisement pages to-day.)

Low-Temperature Carbonisation Developments. — *The Times* reports that a scheme for the reorganisation of Low Temperature Carbonisation, Ltd., and Gas and Fuel Plants, Ltd., and amalgamation with the Barnsley Smokeless Fuel Company has been approved by shareholders and creditors. Under the scheme £150,000 fresh capital is provided by the issue of that amount of 8 per cent. prior lien debenture stock.

Electrical Work for New Buildings : Architect or Building Contractor?—Writing under the title "Are We Barking Up the Wrong Tree?" *Electrical Merchandising* says:—"For some time the electrical industry has been concerned with establishing a working connection with the architect, on the theory that through this avenue approach can be made to the better class of homes. Now comes an analysis of the record of buildings erected in one western community, which suggests that the architect has perhaps been given too prominent a place in the picture and that time may more profitably be spent in educating the man who is handling the far greater part of the home construction in the average city—namely, the contractor and builder. On a single day, the city of Oakland, California, issued permits for the building of 105 homes. Of these, but two passed through the hands of architects. Berkeley allowed 29 homes to be erected, of which five had architects. Alameda issued five permits, with but one architect involved. This was a typical day and typical not of this community alone, but of conditions in all parts of the country. The buildings handled by general contractors through their own organisations without outside counsel is enormous. Only in a few sections of the country is the electrical industry doing anything constructive toward reaching this important group."

Fuller's United Electric Works, Ltd.—On April 29th, Sir John Mann, 8, Frederick's Place, Old Jewry, E.C.2, was appointed as receiver and manager of this company at the instance of the holders of the prior lien debenture. That appointment was subsequently confirmed by the Court, who also constituted him receiver and manager on behalf of the holders of first mortgage debenture stock. In a circular to the unsecured creditors Sir John Mann states that the business is now being carried on under his control. The board recently conferred with some of the principal unsecured creditors, who have appointed a committee of six of their number, who are inquiring into the position, and it is understood that they hope to make proposals for continuing the business. Meanwhile steps are being taken to conserve the position in the interests of all concerned. With this object one of the unsecured creditors, who is a member of the Committee, has filed a petition for the liquidation of the company, but by arrangement with the Committee and with Sir John Mann this petition is being held over.

Electrical Exhibition.—DUBLIN.—The Dublin Municipal Electricity Department recently held an exhibition of electric cooking and domestic appliances in the Mansion House, and it proved highly popular and successful. Demonstrations of the uses of electricity to the housekeeper proved to be of great interest.

Trade Announcements.—THE ISCA ELECTRICAL ENGINEERING COMPANY has opened new showrooms at 177, Sidwell Street, Exeter.

MESSRS. PHILIPS LAMPS, LTD., have opened a new branch and distributing centre at 34, Marsh Street, Bristol (Telephone: Bristol 2746), where they will carry larger stocks of all their products to meet the West of England demand.

MR. WALTER BLENKARN has been appointed North of England representative of Electrical Utilities, Ltd.

Catalogues and Lists.—MESSRS. FERGUSON, PAILIN, LTD., Higher Openshaw, Manchester.—A series of illustrated pamphlets dealing with 11,000-V and 88,000-V oil-immersed circuit-breakers, rocking-type isolating switches, metal-clad switchgear, and cubicle gear.

THE EVER-READY CO. (GREAT BRITAIN), LTD., Hercules Place, Holloway, N.7.—A pamphlet advertising the "Super 1" h.p. battery for radio work.

MESSRS. MICKELWRIGHT, LTD., Alperton, Wembley.—12-page illustrated booklet and price list of resistances, dimmers, battery charging boards, &c.

MR. J. H. HEATHMAN, Parson's Green, Fulham, S.W.6.—Illustrated and priced leaflets advertising ladders of various patterns.

THE JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, S.W.1.—May blotter advertising the company's new open-type boiling plate

THE GREGSON MANUFACTURING CO., LTD., 31, Tenby Street, Birmingham.—An illustrated catalogue of wood fittings for electric lighting, with a price list.

MESSRS. NASH & HULL, LTD., 87, New Oxford Street, London, W.C.1.—Fully illustrated and priced catalogue (72 pp.) of various electric signs, sign letters, plates, tablets, &c.

ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI.—May list of motors and dynamos in stock at Charleroi.

Bankruptcy Proceedings.—A. F. KINGDOM, 86, Old Town Street, Plymouth, late Tavistock Street, Devonport, electrical and wireless engineer.—The adjourned public examination of this debtor was to be held on April 30th, at Plymouth, but debtor did not appear, and the examination was adjourned *sine die*.

ALFRED NORTH and FRED NORTH, trading as A. & F. North, 38, Bradford Road, and Market Place, both Dewsbury, wireless and electrical engineers.—The public examination of these debtors was held recently at the County Court House, Dewsbury. The statement of affairs showed gross liabilities of £2,735, of which £2,700 was expected to rank, while the assets were estimated to realise £746, from which preferential claims of £35 had to be deducted, leaving a deficiency of £1,989. Debtor A. North said that they did not call their creditors together earlier because they were hoping to obtain more capital and form the concern into a limited company. Debtor F. North was also questioned, and debtors were ordered to complete their cash and goods accounts and to prepare a trading account and an amended deficiency account from the commencement of their business to the date of the receiving order, and the examination was adjourned.

R. H. W. PARTON, electrical installation engineer, late of 353, Richmond Road, East Twickenham, now residing at 18, Bristol Road, Sheffield.—Receiving order made May 3rd on debtor's own petition. First meeting, May 21st, at the Official Receiver's office, Figtree Lane, Sheffield. Public examination, June 3rd, at the County Court Hall, Sheffield.

D. E. DAVIES, wireless engineer, 19, Poulton Street, Kirkham.—First meeting, May 14th, at the Official Receiver's offices, 11, Winckley Street, Preston.

A. J. REFOY (Varley Radio Co.), dealers in wireless apparatus, 178, Ancona Road, Plumstead, S.E.—First and final dividend of 5½d. in the £, payable May 17th, at the Official Receiver's office, 29, Russell Square, W.C.1. (Amended notice.)

A. M. WILLMORE, electrical and radio engineer, 45, King Street, Brighton.—Receiving order made May 7th, on debtor's own petition.

W. H. GREENALL (Hampton Electric Co.), electrician, Newerne Street, Lydney.—Receiving order made May 4th, on debtor's own petition.

Company Liquidations.—H. E. DAVIS, LTD., 4, South Street, E.C., radio and electrical manufacturers and agents.—An adjourned meeting of creditors was held on May 3rd, at the Institute of Chartered Accountants. Mr. Baker (Wholesale Traders' Association) asked if Mr. Davis was prepared to make any offer. Mr. Davis replied that the stock could be realised for about £2,000. It was not his idea to put the company into liquidation or to appoint a receiver, but he was forced into that position owing to a writ being issued which could not be met. He was confident that if the matter was left in the hands of the present liquidator to deal with, some dividend would be paid to the creditors. Mr. Baker asked if Mr. Davis was prepared to agree that one half of the amount realised from the assets should go as part payment for the debentures and the other half towards a dividend for the unsecured creditors. Mr. Davis said that he could not agree to that suggestion. It was stated that there was an order on the file for compulsory liquidation and the creditors passed a resolution agreeing to support the winding-up petition.

T. W. JEFFERSON, LTD., Liverpool, electrical engineers, &c.—A meeting of creditors was held recently, when the statement of affairs presented showed liabilities of £4,239. The net assets were £4,448, leaving a surplus so far as the unsecured creditors were concerned of £209. Debentures (£4,776) were held by the bank, which had appointed a receiver. The company was registered in September, 1919, with a nominal capital of £10,000, which was subsequently increased to £50,000. There had been a substantial turnover, but losses had been incurred during recent years. It was decided to confirm the voluntary liquidation of the company, with a committee of six of the creditors. The following are creditors:—

	£		£
Baxendale Bros., Ltd.	230	Macintosh & Co., Ltd.	30
Downes & Davies	1,695	Middlesbrough Electric Tube Co.	20
Dodd & Oulton	218	Price's Patent Candle Co. ...	181
Edison Swan Electric Co., Ltd.	60	Porter Bros., Ltd.	25
Electrical Conduits, Ltd. ...	177	Porter, A. S., & Co.	20
General Electric Co., Ltd. ...	154	Quiggin & Co., Ltd.	24
Henry & Paris, Ltd.	190	Ross & Alexander	20
Hill, J., & Son	26	Rowe Bros. & Co., Ltd.	230
Johnson, Clapham & Morris ...	33	Simplex Conduits, Ltd.	20
Liverpool Electric Cable Co., Ltd.	50	Stella Electric, Ltd.	107
Mosers, Ltd.	38	Scottish Tube Co.	560
		Whitehouse & Sons	37

H. C. TOFIELD, LTD., wireless accessory dealers, Church Street, Birmingham.—A meeting of creditors was held recently, at the offices of Messrs. Poppleton & Appleby, C.A., 26, Corporation Street, Birmingham. Mr. C. T. Appleby, the liquidator, presented a statement of affairs which disclosed liabilities of £3,164, all of which was due to unsecured creditors. Mr. H. C. Tofield was a creditor for £585 in respect of salary, but that amount was not expected to rank. The net assets were stated to be £1,173, leaving a deficiency, so far as the unsecured creditors were concerned, of £1,991. Some twelve months ago the principal creditors were consulted, and it was then agreed that the company should continue trading under the supervision of two of the principal creditors, and that payment of the liabilities should be made by instalments. An instalment of 2s. 6d. in the £ was paid in March, but when the second instalment became due the company was unable to meet it. The company was registered in July, 1922, with a nominal capital of £2,000. The liquidator stated that the works had been closed, and the plant and machinery had been sold. A resolution was passed confirming the appointment of Mr. Appleby as the liquidator.

WATMEL WIRELESS CO., LTD.—A petition for the winding up of this company has been presented to the High Court by Mr. C. D. Melhuish, shareholder and electrical instrument maker, of 53, Highbury Park, N., and will be heard in London on May 18th.

FULLER'S UNITED ELECTRIC WORKS, LTD.—A petition for the winding up of this company has been presented to the High Court by Messrs. R. Armstrong & Co., 3, Cloak Lane, E.C., and was to be heard in London on May 18th.

BRITISH UNION LAMP WORKS, LTD.—A meeting of creditors was called for May 17th, at 1, Royal Liver Building, Liverpool,

by the liquidator, Mr. A. L. Glencross. (This notice is formal; all creditors will be paid in full.)

L. WEEKES, LTD.—First dividend of 2s. in the £, to unsecured creditors, payable at the office of the liquidator, Mr. B. T. Crew, George Street West, Luton.

SHENTON & Co., LTD.—A meeting of creditors is called for May 26th, at the offices of Messrs. Poppleton, Appleby and Hawkins, 4, Charterhouse Square, E.C. Particulars of claims to the liquidators, Messrs. E. H. Hawkins & W. B. Pearson, 4, Charterhouse Square, E.C., by June 30th.

NADIN & DELL ELECTRIC, LTD.—A meeting of creditors was called for May 12th at the liquidators' offices, 5, Bold Street, Warrington. Particulars of claims to the liquidator, Mr. L. A. Voisey, by June 23rd.

BURWOOD (CONCESSIONAIRES), LTD.—Winding up voluntarily. Liquidator, Mr. G. E. McCaulis, Oxford House, 9-15, Oxford Street, W.1. Meeting of creditors at 50, Gresham Street, on May 26th.

Dissolution of Partnership.—S. E. MYRANS & Co., motor and wireless accessory agents, 16, Atkinson Street, Manchester. —Messrs. S. E. Myrans, H. D. Mackie and E. E. Macdonald, have dissolved partnership. Debts will be attended to by S. E. Myrans & Co., Ltd., of 16, Atkinson Street, Manchester, who are continuing the business.

Book Notices.—The Electrical Association for Women has decided to publish a quarterly paper *The Electrical Age for Women*, edited by Miss C. Haslett, in order to keep members informed of the rapidly increasing activities of the Association.

Electrician Annual Tables of Electricity Undertakings for 1926. London: Benn Bros., Ltd. Price 10s. net.—This, the thirty-ninth, edition has been further expanded, and the tables now contain details of over 2,000 home, Colonial, and foreign electricity undertakings. Among the useful information imparted, in addition to details of plant and prices, are the addresses of showrooms where these exist.

Lighting and Power Notes.

Accrington.—ELECTRICITY CHARGES.—The Corporation Electricity Committee is introducing special charges for all-electric houses in the borough, at the following rates: A charge of 15 per cent. per annum on the rateable value of the dwelling, plus ½d. per kWh for all electricity used, on condition that no coal or other fuel be used, the arrangement to be continued for two years, with an extension beyond that period if it is so desired. The Committee has also decided that, in future, all electrical cookers and boilers shall be installed free if purchased from the Corporation.

Australia. — BRISBANE. — The *Industrial Australian and Mining Standard* states that the City Council has practically decided to erect its own power station, instead of taking over the undertaking of the Brisbane City Electric Light Co. The report of the chief engineer of the Tramways Department, and the manager of the Electricity Supply Department, proposes an initial installation of two 7,500-kW sets, switchgear, boilers, &c., at an estimated cost of £280,216, together with a transmission line to South Brisbane and distribution mains, transformers, &c., at a cost of £182,500. A third 7,500-kW set would be installed in 1928, which with distribution mains in New Farm and Bowen Hills would cost £130,784, making a total expenditure to 1931 of £593,500.

MULLUMBIMBY HYDRO-ELECTRIC SCHEME.—According to the same journal, the supply of power from the Mullumbimby (N.S.W.) hydro-electric scheme was commenced recently. A supply is being provided for Mullumbimby, Byron Bay, Bangalow, Ballina, Murwillumbah, and Burringbar.

Bradford.—LOAN.—The Electricity Committee has authorised the Town Clerk to apply for sanction to borrow a further £150,000 to cover estimated expenditure on mains and services during the next three years. The Committee has approved electricity extensions at a cost of £12,421.

Bridlington.—ELECTRICITY EXTENSIONS.—At a recent meeting of the Town Council, the Electricity Committee introduced a scheme for the extension of the plant, in place of a previous scheme recently approved, to cost £14,000. The borough electrical engineer said he approved the new scheme and the consulting engineers had ascertained that the Electricity Commissioners would sanction it. The scheme was approved.

Cirencester.—OPPOSITION TO ORDER.—The Rural District Council has decided to formally object to the application of the West Gloucestershire Power Co., Ltd., for an Order to supply electricity in the Council's area on the ground that the Council is not in possession of sufficient information and that no compulsory areas are specified in the Order. The Council has also intimated that it would favour a local inquiry into the application.

Clayton.—INQUIRY.—The Electricity Commissioners are to hold an inquiry on May 19th into the applications of the Urban District Council, the Electrical Distribution of Yorkshire, Ltd., and the Bradford Corporation, for Orders to supply and distribute electricity in the district.

Continental.—CZECHO-SLOVAKIA.—According to *Commerce Reports*, the Ministry of Public Works intends to construct a dam in the valley of the river Treblja. The reservoir formed by this dam will have a capacity of 3,000,000 cu. m. and it is estimated that 42,000 h.p. can be developed. The cost of the entire scheme is estimated at 180,000,000 crowns, and the initial development (7,600 h.p.) at 48,000,000 crowns.

Croydon. — STREET LIGHTING. — The Town Council has applied for sanction to a loan of £6,889 for the conversion of 448 street lamps from gas to electric lighting.

Dover.—LOAN.—The Town Council has applied for sanction to a loan of £6,400 for the provision and laying of a cable to connect the electricity works with the system of the Folkestone Electricity Supply Co.

Harwich.—LOAN.—To meet the continued demands under the assisted wiring scheme, the Electricity Committee is to seek sanction to a further loan of £1,000.

Hastings.—LOAN SANCTIONED.—The Electricity Committee has obtained sanction to the borrowing of £3,500 for a substation and mains on the Grove Estate.

High Wycombe.—STREET LIGHTING.—The Town Council has entered into a new contract with the Wycombe (Borough) Electric Light & Power Co., Ltd., for street lighting for a period of 13½ years, at a fixed charge of £550 per annum, plus 3d. per kWh for electricity consumed up to 40,000 kWh per annum and 2½d. beyond, subject to a reduction when the charge of 10d. per kWh made to consumers in the borough is lowered.

Irish Free State.—THE SHANNON SCHEME.—A letter has been sent out by the Ministry for Industry and Commerce to public authorities within a radius of about 50 miles from Ardnacrusha, Limerick, to the effect that a bulk supply of electricity from the Shannon works will be available in the greater part of the Irish Free State in about three weeks' time.

DUBLIN.—In the Senate recently the promoters of the Dublin Electricity Supply Bill, 1925, were given leave to withdraw it. This has now been done.

Leyton.—LOAN.—The Urban District Council has applied for sanction to a loan of £10,848 for additional plant and a substation.

Linton.—ELECTRICITY SUPPLY.—The Rural District Council has decided to offer no objection to a scheme of electric lighting in the Sawston area by means of overhead and underground cables submitted by the Bedfordshire, Cambridgeshire, and Huntingdonshire Electricity Co.

London.—HAMMERSMITH.—The borough electrical engineer has submitted a report to the Electricity Committee on boiler house extensions in which he recommends the following two alternative schemes: (1) To remove No. 5 boiler, and replace it by a new boiler; (2) to remove Nos. 5, 6 and 7 boilers, and replace them by two new boilers, the estimated cost of the former scheme being £18,800, and the latter £32,201. The Committee has recommended that the larger scheme be carried out. The Committee has also recommended a reduction of approximately 12½ per cent. in the charges for electricity for street lighting.

The Electricity Commissioners have approved the construction of a new 40-inch diameter water discharge pipe line between the generating station and Chancellor's Wharf, and the Committee has decided to proceed with the scheme. The cost is estimated at £16,695.

Manchester.—PROGRESS DURING MARCH.—During the month of March, the Corporation electricity undertaking showed an increase in connections of 2,134 kW, bringing the total to 281,622, and the number of applications received for supply, including consumers for additional supplies, was 904, representing a total of 2,185 kW. The number of hired cookers connected increased by 84, bringing the total actually on circuit to 1,496. Applications for the hire of cookers totalled 132.

Mold.—ELECTRICITY DEADLOCK.—The clerk reported to the Urban District Council recently that a deadlock has been reached in the negotiations between the Council and the North Wales Power Company, the company having declined to amend three clauses in the draft agreement to which the Council would not agree. It was decided to seek the advice of the Council's engineer with the view to placing the matter before the Electricity Commissioners.

Padiham. — ELECTRICITY SUPPLY. — The Urban District Council has decided to operate its Electricity Order, and a Committee has been appointed to ascertain from the Lancashire Electric Power Co. the terms upon which it will be prepared to manage the undertaking for a period of five years, acting on behalf of the Council.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

GILLINGHAM.—Heating: 1½d. per kWh for the first 100 kWh per quarter, and 1d. per kWh beyond.

MAIDENHEAD.—Lighting prepayment meters: 7d. per kWh in the borough and 7½d. per kWh outside the borough.

Sheffield.—LOAN SANCTIONED.—The Electricity Committee has received sanction to the borrowing of £4,500 for the erection of four sub-stations at Botanical Road, Primrose Hill, Denmark Road, and Daniel Hill.

Spalding.—ELECTRICITY IN BULK.—The Urban District Council, on April 28th, decided to accept the offer of the Peterborough Corporation for a supply of electricity in bulk. The cost of the scheme is estimated at £27,000.

Stretford.—LOAN.—The Electricity Committee is to apply for sanction to a loan of £48,000 for sub-stations and cables.

Torquay.—LOAN SANCTIONED.—The Electricity Committee has received sanction to a loan of £10,000 for mains.

Uckfield.—ELECTRICITY SCHEME.—At the general meeting of the Uckfield Gas & Electricity Co., Mr. W. O. Hooper, consulting engineer, submitted a report on the proposed electricity

scheme for the district. Two schemes were suggested, one which would only cover the urban district, at an estimated cost of £21,775, and one which would embrace the parishes of Framfield, Buxted, Maresfield, and Newick, besides Uckfield, the cost of this scheme being £34,600. The company has acquired land adjacent to the gas works for a generating station, and it is proposed to install two 300-h.p. oil engines, and one of 70 h.p.

Whitby.—LOANS.—The Urban District Council has applied for sanction to loans of £1,000 for services and mains, and £2,313 for the installation of rectifying equipment and feeders at the Bagdale sub-station.

Tramway and Railway Notes.

Australia.—SYDNEY (N.S.W.).—The *Industrial Australian and Mining Standard* reports that the electrification of the Milson's Point-Hornsby railway, on the northern side of Sydney Harbour, will be commenced at the beginning of next year. In the meantime preparations are being made for the duplication of the line as far as Chatswood, thus providing four sets of rails, instead of the existing double track. It is expected that the Harbour Bridge will be completed at the end of 1930, and it is considered that the duplication of the Hornsby line, at least as far as Chatswood, will by that time have become imperative. It has therefore been decided to advance the work as far as possible in conjunction with the electrification of the existing tracks, and the completion of the whole work will synchronise with the completion of the bridge.

Bolton.—TRACK RENEWALS.—The Tramways Committee has instructed the borough engineer to proceed with the work of relaying the tramway track from Princess Road to Horwich, on the Chorley New Road route, and to obtain tenders for the necessary rails, points, and crossings.

Continental.—SWEDEN.—The electrification of the railway between Gothenburg and Stockholm has now been completed with the exception of a little work on the Stockholm-Soedertaelje section, and on May 11th an electric train service was commenced over the whole of the reconstructed line.—*Reuter's Trade Service* (Stockholm).

Irish Free State.—DUBLIN-LUCAN ELECTRIC RAILWAY.—At a recent public meeting in Dublin a deputation was appointed to wait on the Dublin United (Electric) Tramways Company to ask that a private Bill be introduced in the Free State Parliament to enable the company to proceed with the work of extension and re-opening of the Dublin-Lucan electric railway, joining up and working in conjunction with the city and district system. It is understood that if the Tramways Company proceeds with the Bill its progress will be facilitated by the Government, and the extension and other work may be undertaken very soon.

Japan.—RAILWAY ELECTRIFICATION.—It is reported that the trial running of electric trains between Tokio and Odawara and Tokio and Yokohama has proved successful, and the period of trial will be completed in June or July next. The sections to be electrified under the present project are Kodzu-Numazu, Numazu-Akashi, Ueno-Omiya, and Kokubunji-Hachioji, besides which the Yamanote freight line is to be electrified, the whole scheme being completed by the fiscal year 1931-32.

NEW ELECTRIC RAILWAYS.—Messrs. Y. Yaginuma and S. Ota, of Koriyama propose building an electric railway from Koriyama to Yumoto, Fukushima-ken, and an application for a charter has been presented to the Railway Minister. The building of the Hitohata electric railway of the Hitohata Electric Railway Co., Shimane-ken is to be started shortly, and will be completed by September, 1927.

New Zealand.—RAILWAY ELECTRIFICATION.—According to *Tenders*, the Government has decided to electrify the Lyttelton railway tunnel and the remainder of the Christchurch suburban railways.

Telegraph and Telephone Notes.

New Atlantic Cables.—ITALIAN CONTRACT.—The Government has been authorised definitely to ratify the provisional contract with the (Italian) Italcablo Company for laying cables between the Azores and Cape Verde, between Italy and the Azores, and between Lisbon and Malaga.—*Reuter* (Lisbon).

The Telephone and Telegraph Services.—During the ten days' general strike, which ended on May 12th, the Post Office telegraph and telephone services were maintained in spite of being threatened, and functioned almost normally throughout. On May 10th it was reported that 25 telegraph wires had been cut near Blaydon, in Durham.

Radio Notes.

Australia.—BROADCASTING IN VICTORIA.—According to the Government statist, there are now about 370,000 families in the State of Victoria. There is thus a receiver in use for about every seven families and the effect of the increase in the power of 3LO is reflected in the increase in the number of licences in Victoria in the first three months of 1926. The *Industrial Australian and Mining Standard* says that the reduction of 3LO's wave has been responsible for a marked increase in interest in broadcasting.

The B.B.C.—NATIONAL SERVICE.—During the ten days' general strike, which ended on May 12th, all stations of the British Broadcasting Co., Ltd., functioned uninterruptedly. Apart from the musical programmes, the official news bulletins and notices radiated on behalf of the Government frequently during the day were of much assistance to, and highly appreciated by, the population, especially during the period when all newspapers were forced to suspend publication.

Uruguay.—RADIO REGULATIONS.—A law for the control of radio in Uruguay was proposed by the President in a message to Congress dated March 2nd, 1926. The message contained a draft of the proposed regulations, which are described as being mildly regulatory. According to *Commerce Reports*, broadcasting stations will be required to secure licences, and may not use wavelengths employed by official stations. Amateurs will be restricted to particular hours; transmission of malicious or immoral material is prohibited, and fines and punishment for infractions are provided. There is no mention of any regulation of receivers, either as to licensing or as to types of sets that may be used.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—June 28th. Electricity Commission of Victoria. 22,000-V transformers and spares (B X 2528).*

June 16th. Victorian Government Railways. One heavy-current motor generator set. (B X 2527).*

Belfast.—May 20th. Electricity Committee. D.c. sub-station switchgear and transformer kiosks. (See this issue.)

Belgium.—ANTWERP.—May 27th. Direction de l'Outillage. Three electrically-operated cranes, each 1,000 kilos capacity. (A X 3107).

Bolton.—The Tramways Committee has decided to invite tenders for the supply of 12 bogie tramcars of the 80-seater vestibule type.

Dublin.—June 3rd. Great Northern Railway (Ireland). Six months' supplies of stores, including electrical fittings, lamps, cable, wire, &c. (See this issue.)

Eccles.—May 31st. Electricity Department. Twelve months' supply of single-phase a.c. house service integrating watt-hour meters. (See this issue.)

Edinburgh.—May 21st. Education Authority. Complete electrical installations at several schools. Mr. John Stewart, executive officer.

Egypt.—CAIRO.—June 30th. Ministry of the Interior. One Diesel engine direct coupled to an 80-kW generator, complete with switchboard. (B X 2537).*

Epsom.—June 14th. Electricity Department. Removal of boilers and setting them up as fuel tanks, overhead travelling crane, two 300-kW Diesel engine-driven generators and accessories, oil purifying plant and cooling tower. (See this issue.)

Harrogate.—May 31st. Electricity Department. Electricity meters (British make) for six months. (See this issue.)

India.—June 15th. India Store Department. 70,000 (approx.) copper bonds for track rails. (See this issue.)

Kettering.—June 9th. Electricity Department. Water-softening plant. (See this issue.)

Letterkenny.—May 17th. Electricity Department. Crude oil engine and a.c. sets, switchgear, and a.c. 3-phase overhead distribution system. (See this issue.)

London.—BETHNAL GREEN.—June 4th. Borough Council. Electric lighting and power installation at Bethnal Green Hospital. (See this issue.)

Normanton.—June 1st. Urban District Council. Feeder and distribution cables, feeder pillars, and one 200-kVA transformer. (See this issue.)

South Africa.—June 21st. South African Railways and Harbours. Track bonds for the Cape Town Suburban Railway electrification scheme. (See this issue.)

Stoke-on-Trent.—June 9th. Electricity Department. Two 60,000-lb. per hour water-tube boilers. (See this issue.)

Uruguay. — MONTEVIDEO. — July 6th. State Electricity Works. 1,000,000 metres of insulated conductors. (B X 2523).*
July 9th. 137,500 metres rubber-insulated wires and cables. (B X 2548).*
40,000 metres of coloured twin conductor cords. (B X 2549).*

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Barnes.—Electricity Committee. Accepted:—
Cable (£8,464).—Siemens Bros. & Co., Ltd.
Extension panel (£209).—General Electric Co., Ltd.

Bolton.—Electricity Committee. Accepted:—
Switchgear for Spa Road sub-station.—Park Royal Engineering Co., Ltd.

Burton-on-Trent.—Electricity Committee. Accepted:—
Switchgear for Gresley sub-station (£649).—Ferguson, Pailin, Ltd.

Cardiff.—Tramways Committee. Accepted:—
30 single-deck tramcars (£45,090).—Brush Electrical Engineering Co., Ltd. —*Western Mail.*

Croydon.—Electricity Committee. Accepted:—
500-kVA Scott-connected transformer for Selhurst (£500), and five 200-kVA air-cooled ditto (£998).—British Electric Transformer Co., Ltd.
Alterations to three steam-driven boiler feed pumps to operate at increased pressure (£314).—G. & J. Weir, Ltd.

Dundee.—Education Authority Works Committee. Accepted:—
Electric lighting installation at various schools.—A. Westwood & Co. (£430); J. Smith (£455 and £342); Quirk & Co. (£233).

Gravesend.—Electricity Committee. Recommended:—
Steam pipes (£292).—Aiton & Co.
Assisted wiring.—Mr. Lambert (23s. 6d. per point).

Grimsby.—Electricity Committee. Accepted:—
E.h.p. switchgear (£1,470).—Metropolitan-Vickers Electrical Co., Ltd.
1,000-kW rotary converter (£4,100).—Electric Construction Co., Ltd.
D.c. switchgear (£1,060).—Edison Swan Electric Co., Ltd.

Kettering.—Electricity Department. Accepted:—
1,500-kW rotary converter (£5,372).—English Electric Co., Ltd.
Transformers.—Hackbridge Electric Construction Co., Ltd. (£999); British Electric Transformer Co., Ltd. (£1,385).
E.h.p. and l.p. switchgear (£1,134).—Ferguson, Pailin, Ltd.
E.h.p. and l.p. cables (£3,429).—Union Cable Co., Ltd.

Liverpool.—City Council. Accepted:—
Twenty-four 40-h.p. D.K. 20-A motors and seventy-six 40-h.p. D.K. split-frame motors, £190 per motor (£19,000).—English Electric Co., Ltd.
Steam pipes for Lister Drive electric power station.—Stewarts & Lloyds.

London. — SOUTHWARK. — Electricity Committee. Accepted:—
Oil cooler (£72).—Fraser & Chalmers Engineering Works.

HAMMERSMITH.—Electricity Committee. 2,500 yd. of .15 sq. in. three-core and 1,750 yd. of .075 sq. in. six-core cable:—

ST. MARYLEBONE. — Electricity Department. Recommended:—
L.p. cables for 12 months.—Enfield Cable Works. Ltd.
E.h.p. cables for 12 months.—British Insulated Cables, Ltd.
Sixteen tenders were received, six being incomplete.

Manchester.—Education Committee. Accepted:—
Electric lighting installation, Chorlton Central School.—J. A. Somerset and Co.

Electricity Committee. Accepted:—
Three 500-kVA static transformers for Clayton sub-station.—Fuller Electrical and Mfg. Co. One 7,500-kVA ditto, Old Road "B" sub-station, and two 6,000-kVA ditto, Dickinson Street sub-station.—Ferranti, Ltd. Two 3,000-kVA ditto, Moss Side sub-station.—Hackbridge Electric Construction Co., Ltd.
H. and l.p. switchgear for sub-stations.—Metropolitan-Vickers Electrical Co., Ltd.

Tramways Committee. Accepted:—
Copper trolley wire.—British Insulated Cables, Ltd.
Silicum bronze trolley wire.—F. Smith & Co., incorporated in the London Electric Wire Co. & Smiths, Ltd.
Cadmium bronze trolley wire.—R. Johnson & Nephew, Ltd.

Housing Committee. Accepted:—
Electric lighting installation at certain houses on the Openshaw estate.—J. Armstrong & Co., Ltd.

Oldham.—Electricity Committee. Accepted:—
Transformers.—Ferranti, Ltd.
Earthenware cable ducts.—Albion Clay Co., Ltd.
Electric lamps.—Z Electric Lamp Co., Ltd.

Rotherham.—Tramways Committee. Recommended:—
150 tons of steel tramway rails (£10 7s. 6d. per ton).—Steel, Peech and Tozer, Ltd.

Salford.—Gas Committee. Accepted:—
One electric passenger lift for Bloom Street gas offices (£335).—Etchells, Congdon & Muir, Ltd.

Sheffield.—Electricity Committee. Accepted:—
Twelve 6-way, 3-phase feeder pillars (£588).—W. T. Henley's Telegraph Works Co., Ltd.
Nineteen 11,000-V sub-station switchgear panels (£3,662).—A. Reyrolle and Co., Ltd.

Tramways Committee. Recommended:—
12 pairs twin movable connected points (£1,452).—Hadfields, Ltd.
6 crossings (leg type) (£250).—Titan Trackwork Co., Ltd.

Stoke-on-Trent.—Electricity Committee. Accepted:—
Supply of cables and laying mains for one year.—Callender's Cable and Construction Co., Ltd.
Static transformers and e.h.p. truck-type switchgear.—Metropolitan-Vickers Electrical Co., Ltd.

Sunderland.—Electricity Department. Accepted:—
Prepayment meters.—A.E.G. Co.

Watford.—Electricity Committee. Recommended:—
Cable supplies for one year.—W. T. Henley's Telegraph Works Co., Ltd.

Weymouth.—Electricity Committee. Accepted:—
Laying new services.—Johnson & Phillips, Ltd.
One 3-phase, 50-cycle turbo-alternator and two 20,000-lb. boilers and auxiliary plant.—English Electric Co., Ltd.

Forthcoming Events.

Association of Teachers in Technical Institutions.—At the Polytechnic, Regent Street, W. May 22nd to 25th. Annual conference.

Radio Society of Great Britain.—Wednesday, May 26th. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 6 p.m. Ordinary meeting.

Institution of Electrical Engineers.—Thursday, May 27th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Annual general meeting.

Notes.

Low-Temperature Carbonisation.—In a paper read before the South Wales Institute of Engineers by Mr. David Brownlie, B.Sc., the processes for the production of free-burning smokeless fuel, involving the mechanical compression or briquetting of the charge, before or during carbonisation, were considered. The author emphasised that the whole subject of low-temperature carbonisation was of vital importance to the British colliery industry, which should co-operate in the matter and establish a large central organisation for detailed study. The net cost, spread out amongst all the collieries in the country, would be a small matter compared with the advantages to the whole industry.

Appointments Vacant.—Repairs engineer (£403), for the Hammersmith Borough Council electricity department; executive engineer, Electrical Division, Public Works Department, Government of Bengal; assistant mains superintendent, for the Eccles Corporation electricity department; shift charge engineer, for the Borough of Leigh electricity department. (See our advertisement pages to-day.)

Address on Electricity Generation.—According to the *Financial News*, Mr. Samuel Insull, president of the Commonwealth Edison Co., of Chicago, and other electrical organisations in the United States, addressed the members of the Conservative Party Transport Committee at the House of Commons on April 28th, when several members of the Government were present. Mr. Insull dealt with the question of concentrated production.

French Electric Steel Production.—It is stated that the production of steel in electric furnaces in France in 1925 amounted to 75,433 metric tons, of which 64,186 tons were ingots and 11,247 tons were mould castings, and the total only represented about 1 per cent. of the aggregate output of steel in that country last year. The number of furnaces in France at the beginning of 1926 for the production of electric steel was 22, these only turning out the finer qualities of steel. Now, however, the circles interested in the promotion of the use of electric furnaces are said to be making great endeavours to induce the works producing basic Bessemer steel to adopt a process according to which, after leaving the converter, the material would be refined to a quality similar to that of open hearth steel at comparatively small expense.

Chromium for Electrolytic Printing Plates.—According to *Science* experience at the U.S.A. Bureau of Engraving and Printing has shown that by the application of a thin layer, 0.0002 in. of chromium to electrolytic plates used for printing paper currency, the life of the plates is increased to twice that of the case-hardened steel plates and several times that of nickel faced electrolytic plates prior to the application of the chromium upon them. Considerable research was carried out to develop and adapt the metal for this purpose. Subsequent tests have shown that chromium plating is likewise valuable on other types of printing plates, especially those used for long editions. It will probably be useful on dies and gauges where extreme hardness is required, and may obviate case-hardening them.

Radio Direction-finding Errors.—Messrs. R. L. Smith-Rose, Ph.D., M.Sc., A.M.I.E.E., and R. H. Barfield, M.Sc., Student I.E.E., recently read a paper before the Wireless Section of the Institution of Electrical Engineers, on "The Cause and Elimination of Night Errors in Radio Direction-finding." The object of a large proportion of the investigations carried out by the authors for the Radio Research Board during the past few years has been to ascertain definitely the cause of the apparent variations in bearings experienced on closed-coil d.f. apparatus during the "night" periods. Some of the investigations have led to the development of methods of distinguishing between the electric and magnetic components of wireless waves, and of the separate measurement of their intensity and direction. This portion of the work has recently led to a definite proof of the existence of downcoming waves at the earth's surface with components of suitable polarisation and sufficient intensity to account for a large proportion of the night errors experienced. In this manner the theory originally advanced by Mr. T. L. Eckersley in 1921 to account for the apparent variations in the direction of arrival of wireless waves has been adequately confirmed; and it is now evident that these variations are caused by the action of the horizontal components of electric force in the downcoming waves on the horizontal parts of the direction-finding loops. It is generally assumed that the downcoming waves have travelled *via* the upper regions of the earth's atmosphere without deviating laterally from the great circle plane through the transmitter and receiver, an assumption that has, however, not been sufficiently well justified in the past; the presence of the downcoming waves has hitherto made it difficult to prove whether the direct waves travelling along the earth's surface have not also suffered lateral deviation. Another portion of the authors' investigations has therefore been made to ascertain to what extent, if any, such lateral deviation exists. The problem is one of more than pure scientific interest; for it is evident that, if directional receiving apparatus can be devised which shows the absence of lateral deviation, a direction-finder can at once be provided which is free from the variable night errors that place such a serious limitation on closed-coil direction-finders. The present paper describes the experiments which have been carried out with these objects during the past 18 months. In the course of the experiments the Adcock "four-aerial" direction-finder has been developed, and with its aid it has been shown that the actual deviation in azimuth of wireless waves is practically negligible. These experiments thus constitute a proof that the variable errors observed on closed-coil direction-finders at night are caused by downcoming waves arriving from the upper atmosphere and polarised with the electric force in a horizontal plane. The investigation also indicates the possibility of the Adcock system being developed into a practical direction-finder which is free from night errors, and those errors associated with observations on aircraft transmissions made at a ground direction-finding station.

Local Society.—A meeting of the Edinburgh Electrical Society on May 1st took the form of a visit to the foundry of Messrs. Mackenzie & Moncur, Slateford Road, Edinburgh, when the members present were shown through the moulding and casting departments, and all the various processes were fully explained to them. At the conclusion of the visit tea was supplied by the management and an enjoyable afternoon was spent.

Air Transport Services.—On the occasion of the fifth Gustave Canet Memorial Lecture on April 30th Air Vice-Marshal Sir W. Sefton Brancker, K.C.B., delivered an address concerning the air transport services before the Junior Institution of Engineers. He explained the position of Imperial Airways, and outlined the work it was doing with the aid of the Government subsidy. He said that in no case within Europe had air transport paid its way. The British company had complete freedom in its policy, and had been restricted in its activities only by certain international difficulties, which seemed likely to vanish in the near future. The company, and its predecessors, had already carried over 70,000 passengers across the Channel, with only four fatal accidents.

American Electric Truck Show.—How the American Railway Express Co. saved $96,000 worth of floor space by replacing 168 wagons and 300 horses with 84 electric trucks was revealed by a chart exhibited at the sixth annual electric truck show which was opened at New York on April 26th, in the building of the New York Edison Co. Another chart illustrated the extent to which the substitution of electric vehicles for horse-drawn trucks is reducing street traffic congestion, while another display pointed to the day when the milkman on his morning deliveries will need to walk 146 ft. instead of 370 ft. for the average milk delivery, thanks to the rapid replacement of the old-fashioned milk wagon with modern little electrics. Reporting on the results of a series of stop-watch tests, Mr. Arthur Williams (vice-president, commercial relations of the New York Edison Co.) declared that in the typical small-home residential sections of the metropolitan area the average milk delivery as made by the milkman using a horse and wagon required 50 seconds and called for 370 ft. of walking, whereas the average delivery on the same route made by a milkman using an "electric" required only 44 seconds and 146 ft. of walking. The saving in time and energy, Mr. Williams said, was due to the fact that the latter method enabled the milkman to drive from house to house and confined his walking to the short distance between the truck and the house, whereas milkmen using horses and wagons ordinarily walked from house to house and from wagon to house.

"By replacing its horse-drawn wagons with electric trucks the American Railway Express Co. has saved 48,000 sq. ft. of space in a location where a conservative estimate of the value of floor space is $2 per sq. ft. per year," declared Mr. Williams. "This one company has thus not only secured for itself $96,000 worth of floor space through the replacement of electric trucks for horse-drawn vehicles, but has brought about for the community at large a comparable saving in street space. Three hundred horses and 168 wagons would cover 16½ city blocks of streets; the 84 electric vehicles doing the work of these 300 horses would, in the aggregate, cover 7½ blocks of city streets. When it is known that there are still 50,000 horses in New York, one is impressed with the tremendous reduction in traffic congestion which will be possible if the policy of the numerous owners of large fleets of 'electrics' were universally adopted in New York City." More than 20 manufacturers of electric trucks, batteries for such trucks, and other accessories participated in the electric truck show, which closed on May 1st.

Fatality.—The death occurred on May 7th by electric shock of Charles Alfred Moon, who was on volunteer service, acting as guard on a Southern Railway electric train. As he was coming off duty at Charing Cross he came into contact with the conductor rail, receiving a fatal shock.

Educational.—THE POLYTECHNIC, Regent Street, London.—It has been decided to postpone Mr. W. H. Date's special course of lectures on "The Thermionic Valve and its Uses in Wireless Circuits" until Wednesday, June 2nd.

Aircraft Navigational Aids.—An apparatus by means of which aeroplanes can be piloted through the fog without losing their bearings has been installed at Le Bourget. This radio-goniometric post, as it is called, will be operated in conjunction with the wireless telegraph stations at Abbeville and Saint Inglevert, and will enable commercial aeroplanes to pick up their bearings at any time in the thickest fog.—*Reuter* (Paris).

Registration of Engineers.—A Bill has been introduced into the House of Commons to provide for the registration of engineers and for the regulation of their qualifications; it proposes the establishment of a "General Council of Engineering," partly nominated and partly elected, which shall determine the standard of qualification, keep a register, and take steps to protect the title of "engineer" against misuse. The Bill further provides that after two years, official appointments as engineer shall be held only by registered engineers, and that only registered engineers shall be entitled to issue certificates or recover charges. Registered engineers are to be provided with seals for use on plans, tenders, &c., subject to penalties for improper use. After two years it is to be unlawful for any person to describe his business as that of an engineer unless a registered engineer is engaged therein. The Bill has been prepared by the Society of Technical Engineers. Similar measures have been enacted in the United States and elsewhere.

L.C.C. Tramways Finance.—In a recent report to the London County Council, the Highways Committee states what action has been taken to restore the tramway undertaking to financial equilibrium. Mention is made of the suspension of sinking fund payments on the 25-year debt, and some details are given of the economies in working which have been made. It is pointed out, however, that economies alone will not achieve the desired result, and nothing short of a complete co-ordination of passenger transport services and the elimination of unnecessary competition will bring this about. The Committee hopes that the London and Home Counties Traffic Advisory Committee will take the necessary action.

Tientsin (China) Electricity Undertaking.—We have received a copy of the report on the year's (1925) working of the electricity undertaking of the Tientsin British Municipal Council, North China (engineer and manager, Mr. R. A. Williams, M.C., B.Sc.). The revenue for the year amounted to £47,588, and the expenditure to £33,300, leaving a surplus of £14 28s. The kWh generated during the period amounted to 4,747,699, and the generating costs were 1.8d. per kWh. The fuel cost amounted to only 0.291d. per kWh. The return on the capital outlay for the year, after allowing for ample depreciation, was 19.9 per cent., comparing favourably with the results for the Shanghai undertaking in 1924. In view of the difficulties which the undertaking has had to overcome, due to war, civil commotion, poor trade, and at times fuel shortage, the results obtained are very creditable.

French Electric Vehicle Trials.—Trials of electric accumulator vehicles to take place from June 5th to June 20th have been organised by the Union of Electricity Syndicates in agreement with the Ministry for War, the National Office of Scientific and Industrial Research and Inventions, the Automobile Club of France, and the Central Electricity Laboratory. Great advantages are expected from these vehicles. The accumulators are recharged nightly with the surplus energy of the large electricity works; as this electricity can be sold very cheaply the running expenses of lorries, goods vans, and small trucks for interior transport in factories and warehouses of the kind used in the railway stations are very low. The vehicles used in the trials will be parked for part of each day in the Cours la Reine along the Grand Palais, where the public will be able to examine them.—*Reuter's Trade Service* (Paris).

Institution Notes.

Institution of Electrical Engineers.—Scottish Centre.—On April 30th, at Dundee, Capt. P. P. Eckersley delivered a lecture on "The Past, Present, and Future Development of Wireless Telephony." Prof. Magnus MacLean, chairman of the Centre, presided, and there was an enthusiastic audience of considerably over 500 present. On Saturday, May 1st, members of the Centre and their friends left Dundee for an excursion by road to St. Andrews, where luncheon and tea were served in Rusack's Marine Hotel. The excursion was taken part in by a party of about sixty, including ladies, and was greatly enjoyed by all.

The Institution of Railway Signal Engineers.—Annual Report.—Part 2 (August, 1925, to February, 1926) of the *Proceedings*, 1925-26, of the above Institution contains a catalogue of the Institution library and the 13th annual report (1925). The total membership on January 1st, 1926, was 615. The revenue for the year in question amounted to £650 and the expenditure resulted in a balance of £111.

Association of Mining Electrical Engineers.—South Wales Branch.—The South Wales branch of the Association, meeting in Cardiff, elected Mr. Dawson Thomas, A.M.I.E.E., United National Collieries (Risca), chairman for the ensuing year. Messrs. E. I. David, M.I.E.E. (Aberaman) and T. S. Thomas, A.M.I.E.E. (Bedwas) were elected vice-chairmen, and A. C. MacWhirter, A.M.I.E.E., and H. J. Norton, A.M.I.E.E., re-elected hon. treasurer and hon. secretary respectively. Messrs. C. F. Freeborn (Cardiff), R. Illingworth (Ogmore Vale), W. Roberts (Cardiff) and W. Wolfe (Llanbradach) were elected new members of the committee.

Royal Institution.—Annual Meeting.—The annual meeting was held on May 1st, Sir James Crichton-Browne, treasurer and vice-president, in the chair. The annual report of the Committee of Visitors for the year 1925, testifying to the continued prosperity and efficient management of the Institution, was read and adopted. Sixty-two new members were elected in 1925, and 63 lectures and 20 evening discourses were delivered. The following gentlemen were elected as officers for the ensuing year: President, the Duke of Northumberland; treasurer, Sir Arthur Keith; secretary, Sir Robert Robertson. At a general meeting of the members on May 3rd, Sir J. J. Thomson was elected Honorary Professor of Natural Philosophy and Sir Ernest Rutherford was elected Professor of Natural Philosophy.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Mr. Walter T. Young, of Dundee tramways, has been selected by the Halifax Corporation Tramways Committee as tramway manager (subject to formal confirmation by the next Town Council meeting), in succession to Mr. Ben Hall, who was recently appointed tramway manager to Plymouth Corporation. There were 33 applications for the position.

Mr. W. E. Wimhurst, who is retiring from the staff of Callender's Cable & Construction Co., Ltd., Belvedere, after over 31 years' service, has been presented by his colleagues with a 5-valve wireless set. Sir Tom Callender made the presentation on May 7th.

Mr. T. S. Wallis, station superintendent at the Wimbledon power station, has resigned to take up an appointment with the Bristol Corporation.

Mr. Alan Williams, M.I.E.E., has resigned his appointment with British Brown-Boveri, Ltd., and will be pleased to hear from any of his friends, at 16, Messaline Avenue, Acton, London, W.3.

The *East London Observer* states that Sir George Hume, M.P., has resigned his membership of the London and Home Counties Joint Electricity Authority, and Mr. F. Bertram Galer, M.A., F.I.A., has been appointed a representative of the L.C. Council in his place.

Mr. C. Petersen has been appointed Metropolitan-Vickers' London district manager, in succession to Mr. P. F. Crinks, who is now managing director of the Metro-Vick Supplies Co.

The Aylesbury Council has increased the salary of Mr. W. A. Turnbull, borough electrical engineer, to £750 per annum, and has adopted, as the basis of his future remuneration, the minimum salary scale of the Associated Municipal Electrical Engineers (Great Britain and Ireland).

Mr. A. T. Arnall, B.Sc., has been appointed executive engineer, Electrical Project Division, on the Punjab Government's Mandi hydro-electric scheme.

Mr. Henry G. Spencer has been appointed engineer to Standard Telephones & Cables, Ltd., North Woolwich.

Grange-over-Sands Council has appointed Mr. J. Simms as resident electrical engineer, at £250 per annum.

We are pleased to learn that Mr. P. F. Allan has completely recovered from his operation for appendicitis, and all local correspondence in connection with the affairs of the North-Eastern Centre of the Institution of Electrical Engineers and the Summer Meeting, June 7th-11th, should be addressed to him c/o The Macintosh Cable Co., 26, Mosley Street, Newcastle-upon-Tyne.

We are informed that the appointment of electrical engineer for the burgh has been made by Hamilton Town Council. By 11 votes to 3, Mr. W. J. Cooper (at present acting engineer at the Hamilton Corporation Electricity Works) has been appointed.

The Sunderland Corporation has agreed to express its appreciation of the services of the general manager and engineer, Mr. A. S. Blackman, by giving him three months' special leave of absence, with salary, early next year. Mr. Blackman intends to make a tour in America during that period.

Obituary.—Sir Thomas Skinner.—The death occurred last week, at the age of 86 years, of Sir Thomas Skinner, who, in addition to having large Canadian and other financial interests, was a director of the Commercial Cable Co. and chairman of the Halifax and Bermudas Cable Co. and the Direct West India Cable Co.

Mr. H. W. Bowden.—We regret to learn of the death, which occurred on May 9th, at Modwell House, Great Missenden, of Mr. Henry White Bowden, M.I.E.E. He was 58 years of age.

Will.—The late Mr. A. P. Lundberg left £17,919.

New Companies Registered.

Palmers Green Radio Service, Ltd. (213,594).—Private company. Registered May 3rd. Capital, £100 in £1 shares. Objects: To acquire the business of makers of and dealers in wireless apparatus and gramophones and their accessories of all kinds, carried on by A. E. Frost and F. W. Goff, at 15, Melbourne Parade, Palmers Green. The first directors are:—A. E. Frost, 38, Arlow Road, Winchmore Hill, N.21; F. W. Goff, 102, Woodside Road, Bowes Park, N.22. Qualification, £1. Remuneration as fixed by the company. Secretary: F. W. Goff. Solicitors: Simmons and Simmons, 1, Threadneedle Street, E.C.2. Registered office: 15, Melbourne Parade, Palmers Green, Middlesex.

Reilly & Brookes, Ltd. (213,595).—Private company. Registered May 3rd. Capital, £1,500 in £1 shares. Objects: To carry on the business of electrical, automobile and mechanical engineers, &c. The first directors are:—F. Reilly, 1, Tyldesley Road, Atherton; W. Brookes, 83, Castle Street, Tyldesley; T. Bullough, 456, St. Helen's Road, Bolton. Qualification, 200 shares. Secretary: T. Bullough. Registered office: 12a, Church Avenue, Bolton.

Southwold Electricity Supply Co., Ltd. (213,597).—Private company. Registered May 3rd. Capital, £20,000 in £1 shares. Objects: To carry on the business indicated by the title, and to adopt an agreement with Edmundson's Electricity Corporation, Ltd. The directors are:—A. N. Rye, Woodland, Virginia Water, Surrey; C. H. Jones, 67, Hayes Road, Bromley, Kent; A. Anderson, 141, Worple Road, Wimbledon, S.W. Qualification, 50 shares. Remuneration as fixed by the company. Solicitors: Godfrey Warr, Clarkson & Co., 85, Gracechurch Street, E.C. Registered office: Broad Sanctuary Chambers, Westminster, S.W.1.

Chambers & Champion, Ltd. (213,589).—Private company. Registered May 3rd. Capital, £5 in 1s. shares. Objects: To carry on the business of manufacturers of and dealers in electrical, wireless, and other apparatus, builders, manufacturers of and dealers in metal, wooden, vulcanite and other types of articles, motor and aeroplane manufacturers and dealers, &c. The subscribers (each with one share) are:—C. F. Stewart, 7, Alcester Crescent, E.5, clerk; W. F. Palles, 2, Merton Hall Road, Wimbledon, S.W.19, company director. The directors are:—W. F. Palles and C. G. Hofman. No share qualification required. Remuneration as fixed by the company. Secretary: W. F. Palles. Solicitors: Donald McMillan and Mott, Stafford House, 14, King William Street, E.C.4. Registered office: 7a, Victoria House, South Lambeth Road, S.W.8.

Portable Accumulators, Ltd. (213,692).—Private company. Registered May 7th. Capital, £4,400 in 4,000 10 per cent. participating preference shares of £1 each and 8,000 ordinary shares of 1s. each. Objects:—To carry on the business of manufacturers of, and dealers in electric accumulators and generators of all kinds, &c. The subscribers (each with one £1 share) are:—A. W. Slade, 73, Nichols Square, Hackney Road, E.2, clerk; C. Warren, 32, Heathfield North, Twickenham, clerk. The first directors are to be appointed by the subscribers. Solicitors: Mayo, Elder & Co., 10, Drapers' Gardens, E.C.2.

The North Metropolitan Power Station Co., Ltd. (213,642).—Registered as a "public" company on May 5th, with a nominal capital of £100 in £1 shares. Objects:—To construct or equip or enter into agreements for the construction and equipment of a generating station at Brimsdown, Enfield, to grant a lease of the said proposed generating station to the North Metropolitan Electric Power Supply Co. to generate and supply electricity, to construct, fix, and lay down cables and wires, &c. Minimum cash subscription, 7 shares. The first directors are:—Sir James Devonshire, 55, Broadway, Westminster (chairman and managing director, North Metropolitan Electric Power Supply Co.); Emile Garcke, 88, Kingsway, W.C.; Sir Alexander Roger, Norfolk House, Victoria Embankment, W.C.; E. R. Soames, 88, Kingsway, W.C.; C. G. Tegetmeier, 88, Kingsway, W.C. The last four named are all directors of the above-named company. Qualification, £1. Remuneration (except managing directors), £250 per annum, divided between them. Secretary: E. Boys. Solicitors: Stanley & Co., 11, Albemarle Street, W.1. Registered office: 55, Broadway, Westminster, S.W.1.

Mold Accumulators, Ltd. (213,656).—Private company. Registered May 5th. Capital, £1,000 in £1 shares (500 6 per cent. cumulative preference and 500 ordinary). To acquire the business of an accumulator manufacturer now carried on by A. Tunnicliff at Grosevnor Street, Mold, Flint, as "Arthur Tunnicliff." The permanent directors are:—A. Tunnicliff, Bromfield Villa, Mold; E. Tunnicliff, 10, Broncoed Park, Mold. Qualification, 10 shares. Remuneration, £50 per annum, divided between them. Solicitor: W. P. Morris, Church Lane, Mold.

British Glowlamp and Valve Co., Ltd. (213,648).—Private company. Registered May 5th. Capital, £1,000 in £1 shares. Objects:—To acquire the business of an electrical and mechanical engineer and a manufacturer and repairer of wireless valves and parts and electric light globes and parts now carried on by A. Barnes-Thomas at 27, Kirby Street, Hatton Garden, E.C.1, as "The British Glow Lamp and Valve Co.," and to adopt an agreement with the Barnes Land and Trust, Ltd., and Albert Barnes-Thomas. The first directors are:—A. Barnes-Thomas, 64, Louisen Str., Dresden, Germany; S. H. Price, 8, Carew Road, Wallington. Qualification, 50 shares. Remuneration, £50 each per annum. Solicitors: Saml. Price, Sons & Robertson, 3, Bond Court, Walbrook, E.C.4. Registered office: 27, Kirby Street, Hatton Garden, E.C.4.

H. H. Ridley & Co., Ltd. (213,637).—Private company. Registered May 5th. Capital, £2,000 in £1 shares. Objects:—To carry on the business of electrical, mechanical, and motor engineers and contractors, dealers in wireless apparatus, garage proprietors, motor-car dealers, &c. The first directors are:—H. H. Ridley, 30, Lawn Crescent, Kew Gardens, motor engineer; W. A. Rich, 26, Peabody Buildings, Old Pye Street, Westminster, motor engineer. Qualification, 1 share. Solicitors: Bateman and Co., 5, John Street, Bedford Row, W.C.1. Registered office: Orchard Road Motor Works, Orchard Road, Richmond.

Cattley Accumulator Co., Ltd. (213,534).—Private company. Registered April 30th. Capital, £5,000 in £1 shares. Objects:—To acquire the business of L. de M. Cattley and R. E. D. Cattley, trading as the "Cattley Accumulator Co.," and to carry on the business of manufacturers of accumulators and batteries, of which L. de M. Cattley is patentee, &c. The subscribers (each with one share) are:—M. J. Coggins, 46, Charles Street, Cardiff, auctioneer; H. Blake, 106, Plymouth Road, Penarth, engineer. The first directors are:—L. de M. Cattley, R. E. D. Cattley, E. J. Davies, S. A. Smith, and T. B. Humphries, addresses not stated. The first two named shall be permanent so long as they each hold 200 shares. Qualification, 200 shares. Remuneration as fixed by the company. Solicitor: E. J. Davies, 39, Charles Street, Cardiff.

Ormsby & Co., Ltd. (213,554).—Private company. Registered April 30th. Capital, £2,000 in £1 shares. (850 5 per cent. cumulative preference and 1,150 ordinary). Objects:—To acquire the business of manufacturers of, and dealers in wireless receiving and transmitting apparatus carried on at 28, Page Street, Westminster, and at Elstree, Herts., as "Ormsby & Co.," and to adopt an agreement with R. Ormsby Cary, A. Barringer, L. Ormsby, and J. St. C. Bryden. The first directors are:—R. O. Cary, Pomfret House, Sunbury-on-Thames, wireless manufacturer; A. Barringer, "Isca," Boreham Wood, Herts., electrical engineer; L. Ormsby, 77, Page Street, Westminster, wireless manufacturer; J. St. C. Bryden, 5, Shardcroft Avenue, Herne Hill, S.E., wireless manufacturer (all permanent, subject to holding 300 shares each). Solicitors: Oliver Richards & Parker, 1e, King Street, St. James', S.W. Registered office: 21, George Street, Hanover Square, S.W.1.

Official Returns of Electrical Companies.

"M.K." Electric, Ltd.—Issue on May 1st, 1926, of £1,000 debentures, part of a series already registered.

Simmonds & Stokes, Ltd.—Satisfaction to the extent of £2,000 on March 24th, 1926, of debentures dated April 15th, 1924, securing £7,000.

Scammell & Abbott, Ltd.—W. F. Chaundy, of 71, Temple Row, Birmingham, C.A., was appointed receiver and manager on April 24th, 1926, under powers contained in first mortgage debenture dated March 17th, 1926.

Midland Electric Lamp Co., Ltd.—Particulars filed of £500 debentures authorised March 16th, 1926, charged on the company's property, including uncalled capital, the amount of the present issue being £300.

Magnetic Transmission Co., Ltd.—G. T. G. Stevens, of Carlton House, Regent Street, S.W.1, ceased to act as receiver or manager on April 30th, 1926.

Aldeburgh Electric Supply Co., Ltd.—Satisfaction in full on April 13th, 1926, of charge dated August 7th, 1912, securing all moneys due or to become due not exceeding £2,500.

Isaacson & Brown, Ltd.—H. C. Mundy, of 93 and 94, Chancery Lane, W.C.2, ceased to act as receiver or manager on April 22nd, 1926.

H. Haydon & Co., Ltd.—T. F. Birch, of Court Chambers, Friar Lane, Leicester, C.A., ceased to act as receiver or manager on May 3rd, 1926.

Instrument Screw Co., Ltd.—Debenture dated April 22nd, 1926, to secure £3,000 charged on the company's undertaking and property, present and future, including uncalled capital, land at South Harrow, and the company's other freehold, leasehold, and copyhold property. Holders: Branch Nominees, Ltd., 15, Bishopsgate, E.C.

H. T. Boothroyd, Ltd.—Satisfaction in full on May 3rd, 1926, of charges dated February 2nd, 1910, and September 11th and November 26th, 1923, securing all moneys due or to become due from the company to the Union Bank of Manchester, Ltd.

Clemson & Smith, Ltd.—Mortgage dated April 30th, 1926, to secure £200 and further advances not exceeding therewith £500 charged on certain freehold land and buildings in Hersham Road, Walton-on-Thames. Holder: Miss E. S. Creed, Jessamine Cottage, High Street, Bampton, Oxford.

Nelson Electric Co., Ltd.—G. S. Hyams, of Salisbury House, London Wall, E.C.2, was appointed receiver on April 23rd, under powers contained in debenture dated April 20th, 1926.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Lancashire Electric Light and Power Co., Ltd.

The trading profit of the Lancashire Electric Power Co. for the year ended March 31st last was £177,470, and to this is added £9,376 brought forward, making £186,846. Of this £60,000 has been allocated to depreciation, £9,000 to income tax reserve and £7,928 has been carried forward, leaving a balance of £109,918 which has been paid over to the Electric Light & Power Co. The balance at credit of the profit and loss account of the latter company is £108,169, plus £8,379 brought forward, making £116,548. After paying the preference dividends and interest on new shares, a dividend at the rate of 7½ per cent. is to be paid on the ordinary shares, leaving £9,826 to be carried forward. It is expected that the new Padiham station will be ready for commercial operation in September next. A 33,000-V main is being laid between that station and the Radcliffe station. The report shows that the Power Company generated or purchased 151,495,964 kWh, as against 130,043,552 kWh in 1924-25. The maximum load rose from 60,930 h.p. to 70,200 h.p. and the connections from 79,900 h.p. to 89,200 h.p.

German Companies.

The *Bergmann Electricity Works Company*, Berlin, records gross profits of 6,257,000 marks for 1925, as against 5,301,000 marks in the previous year, the net profit being 2,599,000 marks, as compared with 2,271,000 marks. It is proposed to increase the rate of distribution from 5 per cent. to 6 per cent.

The *Transradio Company for Oversea Communications*, Berlin, states that the technical equipment at the Nauen and Eilvese wireless stations was further improved during 1925, and a material improvement was obtained in the receiving branch, while new installations were projected at Eilvese as a result of the experience gained at Nauen. The possibilities of short-wave signalling were being studied. Short wave transmitters constructed by the Telefunken Company for experimental purposes had been used by the company for some time past with favourable results, and the establishment of larger transmitters was in contemplation. As compared with 1924 the oversea traffic increased last year by 11 per cent. It was possible in the immediate future that the Nauen-Buenos Ayres connection would be amplified by the establishment of direct communication with Rio de Janeiro, where a large station had been completed. The accounts show net profits of 1,370,000 marks, as compared with 1,420,000 marks in 1924, and the dividend is at the rate of 8 per cent. on the ordinary shares. At the recent annual meeting it was mentioned that preparations were being made for the establishment of communication with South Africa.

Craigpark Electric Cable Co., Ltd.—The accounts for the year ended March 31st last show a net profit of £15,289; to this is added £1,518 brought forward, making £16,807. This is distributed as follows: To depreciation, £3,500; to reserve, £3,000; preference dividends, £2,850; dividend of 12½ per cent. on the ordinary shares, £4,688; carried forward, £2,769. The report records the death of Mr. A. B. Maclean, the founder and managing director of the company and the appointment of Mr. G. Herbert as general manager and a director. Messrs. A. Verdie and D. Todd have also joined the board.

British Thomson-Houston Co., Ltd.—The profit for 1925 was £467,200, and with £211,920 brought forward the amount available is £679,120. After defraying interest charges, &c., it is proposed to pay a dividend of 6 per cent. upon the ordinary shares and to carry forward £220,126. The amount expended upon additions to buildings and plant during the year was £289,066, principally upon extensions at the Rugby and Willesden works. Meeting: May 31st.

Philips Glow Lamp Works.—The report of Philips Gloeilampen Fabrieken, of Eindhoven, states that it was able to work at full capacity in 1925 and successfully meet competition, and many new articles in the wireless branch were placed on the market. All the machines, apparatus, buildings and sites acquired during the year were written off at a total of 3,500,000 fl. After having made provision for depreciation on "participations" the accounts show a working surplus of 7,500,000 fl. as compared with 6,210,000 fl. in 1924, the net profits being 4,000,000 fl. and 3,330,000 fl. in the two years respectively. The rates of dividend, as previously announced, remain at 8 per cent. on the preference shares and 16 per cent. on the ordinary capital as in 1924. The ordinary share capital amounts to 17,500,000 fl. as against 14,000,000 fl. in 1924, and the preference shares represent 5,265,000 fl. as against 4,500,000 fl. The directors have resolved to recommend an increase in the share capital this year for the purpose of financing further works extensions.

Calcutta Electric Supply Corporation, Ltd.—The report for 1925 shows a net profit of £422,469 (as compared with £380,254), to which is added £32,823 brought forward, making £455,292. After providing for depreciation, preference dividends, interest, &c., it is proposed to transfer £50,000 to reserve, £3,000 to insurance fund, and £1,000 to retiring gratuity fund. The final dividend on the ordinary shares is 7 per cent., making 12 per cent. for the year, and £33,048 is carried forward. The sales of energy rose from 85,268,793 kWh to 100,587,227 kWh. Work on the new Southern Station is progressing and an issue of 300,000 shares (half preference and half ordinary) has been made to finance the work. Meeting held May 19th.

Ever Ready Co. (Great Britain), Ltd.—The profit for the year ended March 31st last was £139,488 and to this is added £22,691 brought forward, making £162,179. The profit for 1924-25 was £95,683. After transferring £47,242 to reserve and paying dividends, totalling 25 per cent. in the case of the old shares and 20 per cent. on the new shares, £23,864 is carried forward. The report states that there was a considerable expansion in the company's business which was contributed to by subsidiary undertakings. The expenditure on extensions during the year amounted to £16,594 increasing production facilities. Following the authorisation obtained in March last a bonus issue of 49,800 £1 shares was made in the proportion of one to five. After the general meeting on June 1st meetings will be held to sanction the creation and issue of 250,000 new ordinary shares.

Belgian Company.—The *Compagnie Générale de Railways et d'Electricité*, Brussels, which is an investment undertaking with a combined capital of 60,000,000 fr., reports net profits of 7,945,000 fr. for 1925; the dividend is at the rate of 40 fr. per ordinary share. The directors say that the results were very satisfactory; the transport undertakings continued to yield favourable results, the business of the supply works continued to expand, and the manufacturing companies had adequate orders.

Companies to be Struck off the Register.—The names of the undermentioned companies will be struck off the Register at the expiration of three months unless cause is shown to the contrary:—

Aerophones, Ltd.
Bennetts (Electrical Engineers), Ltd.
Beta Light and Heating Co., Ltd.
Hardware and Electrical Co., Ltd.
Lacland Electric Mfg. Co., Ltd.
Residential Wireless, Ltd.
Shaw Electrical Transmission Co., Ltd
Vauxhall Electrical Mfg. Co., Ltd.
Waterloo Electric Co., Ltd.
Wholesale Wireless Co., Ltd.
Wireless Accessories Stores, Ltd.
Wireless Club, Ltd.
Wireless Supplies, Ltd.

Anglo-American Telegraph Co., Ltd.—The report for 1925 states that the dividends paid on the ordinary, preferred and deferred stocks, together with £54,141 for income tax, absorbed £262,500, being the rent paid by the Western Union Co. for the year—equal to 3¾ per cent. on the ordinary, 6 per cent. on the preferred, and 1½ per cent. on the deferred stocks. A balance of £65,625 is available for the payment of dividends for the quarter ended March, 1926. Meeting, May 21st.

Aron Electricity Meter, Ltd.—A final dividend of 3 per cent. is being paid on the preference shares and the ordinary shares are to receive 6 per cent. in respect of the year ended March 31st.

Swedish Company.—The report of the *Svenska Ackumulator A.B. Jungner* states that both orders and output increased during 1925. The net profits rose from 137,000 kr. to 201,000 kr. and the dividend on the ordinary shares is increased from 3 per cent. to 6 per cent.

Luxemburg Company.—The *Societe Luxembourgeoise pour Entreprises Electriques*, of Luxemburg, which is closely associated with the Berlin A.E.G., earned net profits of 411,000 fr. in 1925 and the dividend is at the rate of 11 per cent., as in 1924.

Holsworthy Gas and Electric Supply Co., Ltd.—At the company's annual meeting a dividend of 4 per cent., the first dividend for 10 years, was declared.

British Electric Traction Co., Ltd.—A final dividend of 5 per cent. has been declared on the ordinary shares, making 8 per cent., as against 7 per cent. for 1924.

Western Telegraph Co., Ltd.—The directors have declared the third quarterly dividend of 5s. per share, free of tax.

Guernsey Electric Light and Power Co., Ltd.—After meeting debenture interest, and preference and interim ordinary dividends, a balance of £9,851 remains on account of the past year. It is proposed to transfer £3,500 to general reserve and £500 to employés' benevolent fund; to pay a final dividend of 6 per cent. on the old ordinary shares (making 10 per cent.) and six months' dividend on the new ordinary shares, and to carry forward £776. To meet the growing demand extensions costing about £80,000 are to be carried out. The first portion of the work has been completed and new capital was issued to cover the cost (£17,500). Additional land has been acquired and orders have been placed for 3,000 kW of modern turbo plant.

Potteries Electric Traction Co., Ltd.—The report for 1925 shows a total revenue of £255,985. After meeting all expenses and adding £7,715 brought forward, there remains £19,262. Debenture and loan interest absorbs £13,752 and it has been decided to carry forward the balance of £5,510. Reference is made to excessive omnibus competition, and it is stated that the company's own 'bus services have been considerably extended. Mr. P. M. Rossdale has been appointed to the seat on the board rendered vacant by the death of Mr. J. M. Fells.

Alderley and Wilmslow Electric Supply, Ltd.—After providing for debenture and loan interest, depreciation, &c., and adding £639 brought forward, the balance available from 1925 was £3,426. It was proposed to place £1,000 to general reserve, to pay a final dividend of 5 per cent., free of tax, on the ordinary shares, making 8 per cent., tax free, for the year, and to carry forward £826.

Cuba Submarine Telegraph Co., Ltd.—Final dividend of 5s. tax free, making 5 per cent. for the year.

Market Quotations for Chemicals and Metals.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general and they may vary according to quantities and other circumstances

CHEMICALS, &c.	Price May 19th	Inc. or dec. Since April 27th.
a Acid, Oxalic ... ... per lb.	5¾d.	...

Stocks and Shares.

TUESDAY EVENING.

THE Stock Exchange refused to believe during the General Strike that the end of such a movement could come in any way except one. The only point in doubt was the length of time over which the trouble could extend. Throughout the period, people were trying to buy sound stocks and shares. So far from there being any desire to sell on the part of investors, the reverse proved to be the case, and good-humoured disappointment was expressed by the would-be purchasers at their failure to find anything that was really cheap.

As already indicated, the jobbers in the various investment markets were quick to notice this tendency, and they promptly issued lists of shares that they wanted to buy for brokers acting on behalf of the public. The net result, so far as Stock Exchange prices are concerned, is that values have suffered scarcely at all, and in some cases stand higher to-day than they did at the beginning of the trouble. Where the Stock Exchange has felt the blow mostly is in the loss of business which the uncertainty and suspense occasioned. It remains to be seen whether the settlement will give that impetus to good business which can fill the gaps caused by the attempted revolution.

In the substantial rises that took place early this week, the Home Railway stocks assumed the lead. The Underground group, first to announce resumption of normal conditions of work, stood out well in the rally. Underground £10 shares gained 7s. 6d., and so reverted to the price at which they stood just prior to the outbreak of the strike. The shilling shares, at 11s. 6d., are 1s. 6d. higher on the fortnight, and the 6 per cent. income bonds remain at 99, from which price they moved but little all the time. Metropolitans are 1½ up at 66, and Districts 1½ at 53. The former yield rather over 7½ per cent. on the money, and Districts 6⅝ per cent. The 6 per cent. tax free return from Underground incomes is equivalent to 7½ per cent., taking tax at 4s. in the pound.

Brazilian Tractions enjoyed a somewhat spectacular spurt to 98. The shares are, of course, of dollar denomination, and the rise in the value of sterling to its parity point, the highest reached since the outbreak of war, had no effect in restraining the strength of the shares. United States utility issues are better as a whole, but the improvement has not extended to Mexicans. Mexican Light preferred are two points lower on the fortnight. Mexico Tramways fives are 1 to the good.

Babcock & Wilcox have made a rapid recovery, being 2s. 3d. up at 5½. There would seem to be a shortage of shares in the market, although Babcocks are so strongly held as to make bear selling a risky operation. Johnson & Phillips at 2¾ are ex dividend. General Electrics are nearly 30s. Siemens hardened to 3⅛; the new shares, 18s. paid, are better at 24s. 3d. Edisons are dull at 8s., but the first debenture hardened to 83. Callender's have put on half a crown at 3⅞. Other shares in this group, after a display of dulness, regained their former figures, and are scarcely changed from the levels that ruled at the beginning of this month.

Aron Meter ordinary are firm at 18s. 9d., upon declaration of a 6 per cent. dividend for last year, this going against 3 per cent. in the corresponding period, when the company paid off all the arrears that remained to be dealt with on the 6 per cent. preference shares. The price of the latter stands at 17s. British Thomson-Houston 7 per cent. preference are unchanged at 23s. 6d.; the ordinary are not quoted in the Stock Exchange lists. The company announces a reduction in net profit, but the dividend on the ordinary is the same as before, though allocations to depreciation and reserve are reduced. Criticism is directed to the general reserve being no more than £220,000, which looks comparatively small for a company of the B.T.H. magnitude.

Charing Cross and County ordinary are better, and a few small advances have occurred in the list of provincial lighting shares. Folkestones, for instance, firmed up to 36s. 3d. The cable group is featureless. Great Northerns continue to be quoted at 29. The report may be regarded as somewhat disappointing. Wireless shares have a better tendency, and Radio Common rose to 8¾.

British Electric Traction has jumped to 130½, showing a gain of 3 points. Beyond this, no alteration occurred in this particular section.

The rubber market holds a fair amount of firmness, although demand is restrained by reason of the sagging nature of the raw material's price. Markets on the whole are bright and cheerful. It is declared that the failure of the general strike is a welcome bull point, as proving that this long-cherished threat need no longer be regarded as a weapon capable of paralysing industry.

Application is invited for 8 per cent. (tax free) preference shares and founders' shares in the Cambrian Electricity Supply Corporation, Ltd. The concern is one of the group associated with the Electric Light and Power Contracts Finance Corporation, Ltd. The directors of the Cambrian Electricity Supply Corporation are Maior James Brigden, L. J. Waring and Capt. E. F. Hill. The solicitor is "W. Thompson, Esq."—we quote from the prospectus—whose address is 43, Cannon Street, London, E.C. The whole scheme is founded upon estimates, and it seems astonishing that anyone should deem it worth while to circulate offers of shares in an undertaking of this nature; apparently there are still to be found some people whose ignorance of financial matters can be played upon by a plausibly-worded prospectus.

Published Specifications.

Compiled expressly for this journal by Patent Agents.

The name of the applicant's patent agent, if any, will be found on the printed specification.

The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

27,568. "Electrical installations for railway and like vehicles." J. Stone and Co., Ltd., and A. E. Kennard. November 18th, 1924. (250,627.)

28,532. "Couplings for electrical wires." G. S. G. Morgan. August 4th, 1925. (250,628.)

28,883. "Electron-discharge devices." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.) (Western Electric Co., Inc.). December 2nd, 1924. (250,629.)

1925.

227. "Amplifying systems." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.) (Western Electric Co., Inc.). January 3rd, 1925. (250,641.)

533. "Telephone exchange systems." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (G. Deakin). January 7th, 1925. (250,642.)

534. "Telephone exchange systems." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd. (G. Deakin). January 7th, 1925. (250,643.)

542. "Telephone exchange systems." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.) (G. Deakin). January 8th, 1925. (250,644.)

828. "Selecting switches for use in telephone systems." Siemens and Halske Akt.-Ges. and F. Doring. January 10th, 1925. (250,647.)

1,136. "Control mechanism of electric switchgear." A. Reyrolle & Co., Ltd., W. Anderson, and H. W. Clothier. January 14th, 1925. (250,656.)

1,186. "Illuminating appliances." W. A. Dorey. January 14th, 1925. (250,660.)

1,270. "Brush-tensioning spring for dynamo-electric machinery." British Thomson-Houston Co., Ltd., and A. A. Pollock. January 15th, 1925. (250,665.)

1,271. "Oil-immersed electric switchgear installations." British Thomson-Houston Co., Ltd., H. C. Heath, E. D. Regis, and H. G. Ruddick. January 15th, 1925. (250,666.)

1,272. "Dynamo-electric machines." British Thomson-Houston Co., Ltd., and F. P. Whitaker. January 15th, 1925. (250,667.)

1,273. "Dynamo-electric machines." British Thomson-Houston Co., Ltd., and F. P. Whitaker. January 15th, 1925. (250,668.)

1,301. "Radio direction finders." F. Woods. January 15th, 1925. (250,670.)

1,371. "Construction of plug and socket connections for electrical purposes." G. O. F. Lane. January 16th, 1925. (250,673.)

1,473. "Telephone systems." Automatic Telephone Manufacturing Co., Ltd. (Automatic Electric Co.). January 17th, 1925. (250,680.)

1,474. "Battery-charging arrangements." Automatic Telephone Manufacturing Co., Ltd. (Automatic Electric Co.). January 17th, 1925. (250,681.)

1,709. "Electric switchgear." A. Reyrolle & Co., Ltd., H. W. Clothier, and A. Allan. January 20th, 1925. (250,686.)

1,713. "Electric switches particularly applicable for vehicle warning devices." F. T. Bersey. January 20th, 1925. (250,687.)

1,751. "Dry batteries or batteries with a solidified electrolyte." Soc. Anon. "Le Carbone." February 7th, 1924. (228,872.)

1,803. "Diaphragms for loud-speakers, telephones, gramophones, phonographs, or any sound-reproducing machine." A. M. Foweraker. January 21st, 1925. (250,692.)

2,127. "Telephone systems." Automatic Telephone Manufacturing Co., Ltd., J. E. Ostline, and T. M. Edmunds. January 23rd, 1925. (250,694.)

2,165. "Electric switches." F. B. Cox. January 24th, 1925. (250,696.)

2,971. "Carrier current systems." F. W. Le Tall (Westinghouse Electric and Manufacturing Co.). February 2nd, 1925. (250,703.)

4,493. "Electric signalling systems employing carrier waves." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.) (Western Electric Co., Inc.). February 18th, 1925. (250,713.)

4,726. "Wireless aerials." W. E. Durrant and K. I. Rayment. February 20th, 1925. (250,714.)

5,061. "Diaphragms for sound-reproducing instruments." India-Rubber, Gutta Percha and Telegraph Works Co., Ltd., and W. G. Spinks. February 24th, 1925. (250,719.)

6,496. "Anti-dazzle device for the headlights of motor vehicles." C. W. Nesbitt and B. C. Aldous. March 10th, 1925. (250,728.)

7,265. "Electrical condensers." Dubilier Condenser Co., Ltd. (in voluntary liquidation) (W. Dubilier). March 18th, 1925. (250,735.)

8,353. "Plug and socket connectors and adaptors used in or with electrical circuits and apparatus." A. P. Lundberg, G. C. Lundberg, P. A. Lundberg, and G. Pegg. March 28th, 1925. (Cognate application 11,144/25.) (250,741.)

8,465. "Induction electric motors." D. B. Hoseason and Metropolitan-Vickers Electrical Co., Ltd. March 30th, 1925. (250,743.)

8,579. "High-frequency electric signalling." E. W. Brandle and Metropolitan-Vickers Electrical Co., Ltd. March 31st, 1925. (250,747.)

8,580. "Receivers for high-frequency electric signals." W. J. Brown, C. R. Burch, and Metropolitan-Vickers Electrical Co., Ltd. March 31st, 1925. (Cognate application 14,147/25.) (250,748.)

8,618. "Ignition systems and switches therefor." W. Hemingway, Junr. April 28th, 1924. (232,939.)

9,418. "Joint working of combustion flames and electric arcs." G. T. Southgate. May 7th, 1924. (233,674.)

11,170. "Insulated weak-current flexible conductors." S. G. S. Dicker (Kabelfabrik Akt.-Ges.). April 29th, 1925. (250,765.)

11,280. "Rheostats." Sterling Telephone & Electric Co., Ltd., and P. A. Tiller. April 30th, 1925. (250,766.)

Contractors' Column.

(These particulars of new building schemes are published for the use of contractors and others in search of possible electrical business. Every care is taken by our correspondents to ensure accuracy; if alleged errors are reported to the Editors they will be fully investigated.)

BIRKENHEAD.—Girls' secondary schools, Park Road South; J. A. Milestone and Son, builders, Wallasey.

BLAYDON.—Hospital (£48,000); Blaydon, Ryton and Whickham Hospital Committee.

BOLTON.—36 houses, Lower Edge Lane, &c.; E. Howarth.

BOSTON.—Housing scheme (44), Tattershall Road site, for the T.C.; borough surveyor.

BRIGHOUSE.—40 houses, Smith House estate; E. C. Brook, architect.

BROMLEY (KENT).—84 houses, for the R.D.C.; L. O. Wall, clerk.

CAMBRIDGE.—Extensions, Fulbourne Asylum (£10,000), for the Committee of Visitors; Mr. Francis, clerk. Extensions to Art and Craft Schools (£10,000), for Cambs. E.C.; the clerk.

CHESTERFIELD.—Housing scheme (51), Old Racecourse, for T.C.; H. Clayton, architect, 12, Corporation Street.

CRAYFORD (KENT).—Housing scheme (42), for the U.D.C.; L. B. Burslem, clerk.

CUDWORTH (YORKS.).—Housing scheme (300), Darfield Road site, for the U.D.C.; surveyor.

DUDLEY.—40 houses; borough engineer.

DURHAM.—Ladies' college and 22 houses, for the Council of Durham Colleges; W. T. Jones, architect.

EAST & WEST ARDSLEY (YORKS.).—58 houses, for U.D.C.

EASTBOURNE.—100 houses, Crumbles and Hampton Park estates; Messrs. Underdown, Ltd.

EDINBURGH.—Church and hall for Morningside Congregational Church (£15,000); the Minister.

ELLERTON (RETFORD).—Schools (£20,863), for Notts. E.C.; Richmond and Sons, builders, Retford.

FIFESHIRE.—Miners' Welfare Institute at Cowdenbeath (£15,000); T. Scobie, architect, Dunfermline.

GATESHEAD.—Elementary school, Carr Hill; Education Committee.

HALIFAX.—Housing schemes (80), Booth Town and Nursery Lane; borough engineer.

HASTINGS.—Concert hall, Pier; Hastings Pier Co., Ltd.

HAYWARDS HEATH (SUSSEX).—Housing scheme (126), off New England Road, for the U.D.C.; surveyor.

HERNE BAY.—Additional 50 houses, for the U.D.C.; surveyor.

HOLSWORTHY.—Re-erection of Whitstone Head Mansion, electrically equipped, for Dr. Robert Wharry (£20,000).

HONLEY.—Secondary school; Education Architect, County Hall, Wakefield.

HULL.—69 houses, Rensbury Street; Messrs. Backwell & Foster. 200 houses, East Hull site; city architect. Secondary school, West Hull; Education Committee.

INVERNESS.—Housing scheme (50), for the T.C.; burgh surveyor.

KESWICK.—Secondary school extensions (£10,500), for Cumberland E.C.; Director of Education, Carlisle.

LEEDS.—34 houses, Easterby Grove, Harehills; C. H. & F. Lax. Dance hall, offices and showrooms, Sheepscar Street; Messrs. Gash and Co. Extension, Wyther Hospital; city architect.

LIVERPOOL.—Houses (500), for the T.C.; Walter E. Hughes, builder, Birkenhead.

LONDON (BRIXTON).—Central School, Loughborough Park; L.C.C. architect.

(ILFORD).—Houses (46), Ley Street, for J. W. Lohden. Houses (48), for P. E. Brand. Vicarage, for St. Andrew's parish; A. P. Griggs, architect. High school for girls (£52,925), for Essex E.C.; W. S. Sharpin, builder, Bow.

(MERTON, S.W.).—Secondary school, Raynes Park; Surrey Education Committee.

(NORWOOD, S.E.).—Central school, Carmac Road; L.C.C. architect.

(POPLAR, E.).—Central school, Janet Street; L.C.C. architect.

(STREATHAM, S.W.).—193 houses, Vale Estate; Watts, Ltd.

(TOOTING, S.W.).—Central school, William Road; L.C.C. architect.

(WALTHAMSTOW, E.).—Housing scheme (148), Higham Hill, for the U.D.C.; surveyor.

(WANDSWORTH, S.W.).—160 tenements, East Hill; Messrs. F. E. Billings & Co., Ltd.

(WOOLWICH, S.E.).—Secondary school, Red Lion Lane; Patman and Fotheringham, Ltd.

MANCHESTER.—Technical school, Newton Heath; city architect. Further housing scheme (3,000 houses), Withington; H. Price, city architect, Town Hall.

MERTHYR TYDFIL.—Housing scheme (256), for the T.C.; housing architect, Town Hall.

NEWPORT (MON.).—Technical institute (£25,000); Director of Education, Monmouthshire Education Committee.

OLLERTON.—Schools (£20,863), for Notts E.C.; Richmond & Sons, builders, Retford.

ORPINGTON (KENT).—Housing scheme (39), for Bromley R.D.C.; surveyor. Offices and mortuary (£13,400), for the R.D.C.; J. W. Ellingham, Ltd., builders, Dartford.

OXFORD.—Extensions, Balliol College; University authorities.

OXTED.—Secondary school (£33,500); Surrey Education Committee.

RAWMARSH (YORKS.).—Additional 41 houses, for the U.D.C.; surveyor.

ROTHERHAM.—Additional housing schemes (236), for the T.C.; housing architect.

SALFORD.—Two public libraries; borough engineer.

ST. HELENS.—Housing scheme (80), Broad Oak Road, Allanson Street and Gower Street; A. W. Bradley, borough and water engineer, Town Hall.

SELBY.—Hospital; S. Brabbs, secretary, James Street.

SHEFFIELD.—140 houses, reconstruction schemes; city architect. 122 houses, Manor estate; Messrs. J. W. S. Randall, Ltd. 30 houses, Huntley Road; Mr. J. Ramsden.

SKEGNESS.—Convalescent home (£60,000), for the Derbyshire Miners' Association; the secretary.

SMETHWICK (BIRMINGHAM).—Housing scheme (206), Slatchhouse estate, for the T.C.; borough surveyor.

STOKE.—60 houses, Fletcher site; city engineer.

SUTTON.—Secondary school (£46,500); Surrey Education Committee.

TAMWORTH.—Housing scheme (40), Wigginton Road site; borough surveyor.

WARMINSTER.—Housing scheme (46), for the U.D.C.; W. W. Snailum, architect, Trowbridge.

WELWYN GARDEN CITY (HERTS.).—Houses (78), for the Welwyn Public Utility Society. Houses (72), for the Moat Wood Housing Co. Houses (40), for the County Homes Co.

WENTNOR.—School, for Salop E.C.; education architect, 1, College Hill, Shrewsbury.

WHITEHAVEN.—Houses (54), for the R.D.C.; Border Engineering Co., builders.

WHITWOOD (YORKS.).—Additional 40 houses, Three Lane Ends, for the U.D.C.; R. A. Easdale & Son, architects.

WROTHAM (KENT).—Housing scheme (30), for the U.D.C.; F. T. Moss, surveyor, Borough Green.

The

Electrical Review

VOL. XCVIII. MAY 28, 1926. No. 2,531.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Electricity Supply During the Crisis.

LOOKING back on the events in the electrical world during the recent period of industrial turmoil, an account of which we publish elsewhere in this issue, one cannot but be astonished at the remarkable ease, considering the chaos outside, with which the supply of electricity was maintained. Very few shut-downs were experienced, and those that did occur were in no way due to incapacity on the part of the loyal men to deal with the operation of the plant under emergency conditions. Again, the number of important stations in all parts of the country which, apart from reduced loads, were not in any way affected is almost incredible. Although the success achieved in keeping the machines running was due in great measure to the efficiency of the elaborate emergency schemes, both national and local, which had been prepared months ahead, in the main it was due to the British character of the men who carried on, in many cases under extreme difficulties and hardships. In almost all cases where trouble arose the supply was maintained by the technical staff, which, in practically all instances, consisted of members of the Electrical Power Engineers' Association. We heartily congratulate the E.P.E.A. on the attitude it adopted when the storm clouds appeared, on its passing the "carry on" resolutions, and also on having in its ranks the men who bore the brunt of the situation, involving, in many cases, manual labour.

In the numerous undertakings which were unaffected by the strike there were many men, members of the Electrical Trades Union and similar organisations, who, contrary to instructions from their unions, remained loyal to their undertakings. Great credit is due to these men; it required some courage on the part of the members to defy the unconstitutional instructions of their executives.

The thanks of the industry and of the community are also due to those outside the industry, including many of the fair sex, who came forward with a helping hand.

Many of these volunteers worked hard for long hours under great difficulties, and on unaccustomed duties.

While the successful running of the industry was due mainly to the determination of the participants abovementioned to maintain the supply at all costs, their efforts were the more fruitful as the result of the elaborate plans of the Electricity Commissioners. It is an open secret that these gentlemen had prepared months ahead for such an emergency, and it is whispered that the large number of volunteers who were enrolled were not nearly exhausted. Nor must we overlook the part the Admiralty played in the struggle by co-operating with the Commissioners.

Probably the attitude of certain municipalities with Labour majorities in the control of their undertakings during the crisis has done a good deal to support the suggestion that the general strike was not purely an industrial affair. Certain of these councils appeared to be dissatisfied with the lack of control which the T.U.C. had over their own undertakings, and enlarged on the measures laid down by that body. Many industrial concerns were unable to obtain electricity supplies as the result of the action of some of these authorities. This raises the question of the legality of withholding the supplies, and we understand that the advisability of taking legal proceedings is being considered by some of the firms affected. The action of the St. Helens Council in introducing additional charge engineers into its works will, we believe, require a good deal of explanation.

While it is the desire of all well-meaning men to see as many as possible of the strikers reinstated in their old jobs, it is to be hoped that all employers will support the Prime Minister in his pledge to stand by those who were loyal to the country during the time of trouble. An unsatisfactory situation appears to have arisen in one case, where the chairman of a committee has been compelled to resign as the result of his having neglected the volunteers who were employed during the strike.

One unhappy result of the conflict is the strained feeling which has already been evidenced in the working of certain of the District Joint Councils. The electricity supply industry has during the past six years been able to congratulate itself on the amicable settlement of its disputes through the medium of these bodies; we sincerely hope that both sides will do their utmost to redress any damage to the good feeling within these valuable councils which has been brought about by the breaking of agreements. With regard to the District Joint Boards (employers and technical staffs) the good feeling has been strengthened by the part played by the E.P.E.A., and any doubts which may have existed, as the outcome of the differences of a few years back regarding the relationship between the E.P.E.A. and the E.T.U., have been removed.

The Electric Propulsion of Ships.

It was only to be expected that the discussion which followed Mr. Eskil Berg's paper on "The Electric Propulsion of Ships" (an abstract of which appeared in our issue of February 26th, page 352), should have revealed a disposition to question whether the superiority which the author claimed for the electric drive over the drive through mechanical speed-reduction gearing was justified by actual results. In this country, despite the fact that we were the pioneers in the use of electrical machinery for the propulsion of ships, and also despite the fact that we have built and equipped some of the largest merchant ships which have been fitted with this form of machinery, our shipbuilders and marine engineers have not yet become convinced that for many purposes electric propulsion is superior to all other forms, and they naturally hesitate to accept the claims put forward by our American cousins, who have proved by actual experience with a number of ships of all sizes ranging from the biggest battleship down to small harbour tugs, that the electric drive is better than the system of propulsion which they themselves adopt. There has recently been published in the *Transactions* of the North-East Coast Institution a verbatim report of the discussion which followed the reading of Mr. Berg's paper, as well as a number of items contributed by members who were unable to be present when the paper was read. Much of this discussion—an abstract of which appears on page 811 of this issue—was of a distinctly helpful nature, and together with Mr. Berg's replies to the questions raised, it constitutes a further store of information on this important subject. But where the discussion took the form of questioning the accuracy of the facts given in the paper, or doubting whether the author was not inclined to view his subject in rather too optimistic a light, Mr. Berg was able to show that all that he claimed for the electric drive had already been justified by results actually obtained.

This problem has an interest for the power-station engineer on land as well as for the marine engineer, and the former will read with interest Mr. Berg's remarks on the advantages of the large single-casing turbine as compared with that in which the expansion of the steam occurs in two or more casings. He will note with interest as indicating the trend of power-station practice in the United States, that in that country there are about fifty turbo-generators of 50,000 h.p. running at a speed of 1,800 r.p.m., each built in one casing and all giving high economy. This certainly substantiates the claim that where large powers are required for the propulsion of the fastest and biggest ships, the use of the electric drive enables the number of turbine casings to be greatly reduced, and no doubt this is one reason why the electric drive finds such favour in the United States Navy for the propulsion of battleships and battle-cruisers of the super-Dreadnought type. But the limitations imposed by the Washington Treaty greatly restrict the number and size of battleships which can be built by the naval powers of the world, and electrical engineers will look hopefully towards the adoption of the electric drive for large passenger liners and cargo ships. Mr. Berg appears to be in no doubtful frame of mind as to whether the decision to employ the electric drive for the passenger ship of 17,000 horse-power, the machinery of which was described in his paper, was an eminently wise one. We look forward to obtaining further particulars of the propelling machinery of this vessel, and in due time to have results of the actual trials of her machinery at sea. The latter, it is to be hoped, will prove to be just as satisfactory as have those of the battleships in the United States Navy and thus prove that electricity can be successfully employed not only for the propulsion of vessels of war, but also for large passenger liners. In this way the scope for the electric drive will be considerably widened.

False Economy.

Most of the publicity literature issued by British manufacturers and others in search of foreign trade is of a high-class character. It is recognised by most people that failure to make a good first impression is almost sure to be fatal. The appearance and general "get-up" of a trade list or catalogue go far to make that good impression. The quality of the descriptive matter, illustrations, and other contents must, of course, be such as to maintain the interest, stimulate further inquiry and produce the actual order or contract, but "literature" which, while it contains useful information, is so badly produced that it is ignored or is consigned to the W.P.B. with contempt is not only valueless but worse. All of this may seem so obvious to readers that they may wonder why in these days of publicity activity and propaganda specialisation we occupy our space with such remarks. Our justification lies partly in our own observation of the poor "stuff" that some traders circulate, but especially at this moment in a communication that has just reached us from a very large and important electrical purchaser abroad. Our correspondent, who is constantly in the market for products ranging from the smallest electrical detail to the largest steam and electrical equipment, has sent us some deplorably-produced trade circulars and letters received from a British firm. They are single sheets of the manifold typewritten

class, which are so badly printed that in places they are altogether unreadable; a lot of matter is jumbled together in such a form that it is really painful even to try to read it. Cheap paper, back-slum style of letter heading or none at all, are other characteristics of these cheap specimens of business-killing literature. Far be it from us to magnify the importance of this particular case; we know well enough it is not representative of British manufacturers' methods, and sometimes we have regarded such circulars as the product of cheap and questionable importing houses of the here-to-day and perhaps gone to-morrow class. Our correspondent asks us to warn British manufacturers of the futility of sending such literature abroad, and he adds that in all the matter that reaches him from the United States—and it is very considerable—he has seen nothing like the papers upon which we comment. To this we may add that not only does the circulator of discreditable literature lose through skin-flint economy, but British trading prestige may suffer also.

Italian Engineering.

In its issue for March, 1926, our Italian contemporary *L'Energia Elettrica* makes a bitter attack upon our special correspondent in Italy, in respect of the introductory portion of his article on "The Italian Electrical Industry," which was published in our issue of January 1st, 1926, and upon ourselves, declaring that the critical comments of our correspondent were not only without a basis of fact, but were offensive to the whole body of Italian engineers. The demand is made that our correspondent's name shall be revealed, and that his assertions shall be either substantiated or withdrawn—failing which, we are told, we shall incur the contempt of all decent people ("disprezzo degli uomini onesti").

The impatience of criticism displayed by our Italian friends, as we shall continue to regard them, seems somewhat exaggerated to those who dwell in a country where the freedom of the Press is regarded as a fundamental factor in the liberty of the nation. However, in the interests of international harmony and goodwill we shall not pursue that line of thought, but will content ourselves with the assurance that the comments of our correspondent were made in good faith and with the best intentions; and, if the form they took was not the most acceptable to Italian readers, he shares with us regret that they should have wounded the susceptibilities of those engaged in the construction of Italian hydro-electric installations.

In publishing the letter of Ing. Giacinto Motta, president of the National Association of Electrical Industries, in our issue of February 5th, we appended the explanation of our correspondent, and added an expression of our satisfaction on learning from Sig. Sartori that out of 95 large dams built in Italy, only one (the Gleno dam) had failed. That is a record of which Italian engineers may well be proud, and we freely admit that it goes far to counteract the forebodings of our correspondent.

For the rest, we suggest that our contemporary has taken too serious a view of the matter, putting upon it the worst construction possible, and ignoring the friendly and commendatory remarks contained in the body of the article complained of, which, after all, was an account of the progress of the Italian electrical industry and not a technical treatise on water power. With the request to divulge the name of our correspondent we shall certainly not comply; to do so would be contrary to the traditional practice of the English Press, and a breach of confidence which would indeed bring us into contempt. Our reputation for justice and integrity, fortunately, does not rest in the hands of our Italian contemporary.

Fuel Economy.

THE recent formation of an Institution of Fuel Economy Engineers (announced in our issues of January 1st and February 26th) is a step in the right direction, although the multiplication of associations tends to become somewhat bewildering. The objects of the new Institution are to promote fuel economy and to enable engineers to exchange experience regarding fuel and combustion. The membership is limited to engineers and others who are technicians in fuel consumption. The question of fuel economy is a vital one for electricity supply undertakings, and anything that impresses its importance on the actual executive officers of an undertaking is of immediate value to the financial side of the concern. Especially is this of importance in the smaller undertakings, where it is no one's special job to maintain scrupulous economy in the stoking and general combustion arrangements. It might pay such undertakings to give special encouragement to their engineers to become members or associate members of the new Institution. A glance at the fuel consumption returns of the Electricity Commissioners will indicate that there is ample margin for economy; there are over 200 stations with an average of more than 4 lb. of coal per kWh, a good number being over 7 lb. If we take fuel costs, we find a considerable number ranging upwards from 1d. per kWh sold.

As we have shown on previous occasions, the cost of generation is a minor factor in the total cost of supply, except to long-hour consumers; but it must not be inferred that we would underrate the importance of economy in this, or any other, department of the electricity supply industry, and in most cases it is in the boiler house that the largest saving in working costs can be effected.

As the Institution of Fuel Economy Engineers is collaborating in the movement to form an Institution of Fuel Technology, reported in our issues of March 12th and April 9th, we take it that there is no rivalry between the two bodies, which will eventually form one association.

High-pressure A.C. Rectification.

IN view of the high pressures now employed for long-distance transmission, and the necessity of employing the mains to the best advantage, it is important to keep in mind the possibilities of rectified alternating currents in this connection, and the progress that is being made in the development of the thermionic valve type of apparatus. Rectifying valves, it is true, can at present deal with only very small currents; on the other hand, they can cope with very high pressures indeed, and a small current at a high pressure means considerable power. Valves are made capable of withstanding a maximum inverse voltage (instantaneous value) of 100,000 V, and carrying a current of 0.25 A, which corresponds with a power of 25 kW. Such valves can be put in series for higher voltage, or in parallel for higher amperage, and their efficiency is extremely high. As we pointed out in our issue of December 19th, 1924, the fluctuations usually appearing in the rectified current can be removed by suitable design of the a.c. generator, on the lines explained by Mr. F. W. Maxstadt, giving practically constant current.

Since, for the same stress on the insulation, a line carries twice the power with direct current that it can carry with alternating current, at the same efficiency, it is obvious that the use of direct current implies economy in first cost; it has other advantages, such as the absence of dielectric hysteresis, and the only bar to its employment is the present want of an equally simple means of reconverting it to alternating current of any desired frequency. But this function can also be fulfilled by thermionic or electronic valves, on a small scale, and it is only a matter of time for the method to be developed until it is capable of handling large powers. This subject was dealt with in the papers by the late M. Maurice Leblanc, of which we published translations in our issues of September 8th and 15th, 1922.

That there is a real demand for a system such as this was shown by the exhibit of the Highfield-Calverley "Transverter" at the British Empire Exhibition. One of its great merits is the ability to couple together two undertakings which operate at different frequencies.

The I.E.C. Meeting in America.—III.

A Cursory Account of the Proceedings.

By PHEIDIPPIDES.

The most important point dealt with by the Committee on Rating was the question of permissible temperature rise for electrical machinery. At the Hague meeting, held in April, 1925, a complete list of permissible temperature rises had been tentatively agreed, and in the meantime considered by the National Committees. It is very satisfactory to find that after this detailed consideration all delegates were able to report that all the National Committees were in agreement with the Hague proposals.

As this is the first occasion on which Germany has been officially represented since the war, this meeting is of special importance and interest. During the past thirteen years German practice has diverged somewhat from that advocated by the I.E.C., so that it was a satisfaction to everyone to find that, after a very full discussion, the German representatives were able to agree to all the proposals in spite of the fact that in certain (but unimportant) points the temperature rise alternatives accepted were different from those at present given in the V.D.E. rules.

Agreement was also reached on the question of dielectric tests for electrical machinery, and an important discussion took place on the subject of embedded temperature detectors. Several questions, such as tolerance on test results, method of stating efficiency, spark-gap dimensions, &c., were discussed in detail, and it was decided to submit these items to the various National Committees.

The work of the Rating Committee was very materially expedited through the assistance given by Prof. Feldmann, of Delft University, who prepared the report for the plenary meeting.

The official British delegate on the Committee on Traction Motors was Mr. Peck, and several long meetings were held at which controversial points were subjected to a very searching examination. Much discussion took place on the classification of rating, temperature rise, ambient temperature, conditions of test, and voltage during test, but it appeared that most of the difficulties were language difficulties, and that on all basic principles there was substantial agreement. Subject, in certain cases, to the agreement of the French National Committee, it was decided to retain three classes of rating for traction motors: (*a*) Continuous; (*b*) one hour; (*c*) excess current; to measure temperature by resistance; and to adopt 25 deg. C. as a standard ambient temperature. The rating of field-control motors should specify the excitation corresponding to the rating, and the rating test should be made at that excitation. For all tests, except the continuous-load test on totally-enclosed motors, the rated voltage should be adopted, but for the exception a reduced voltage will be specified.

Certain questions on temperatures in totally-enclosed motors, and commutation temperatures for class A and B insulation, were also referred to National Committees.

The work of the Committee on Insulating Oils, presided over by Mr. Fulweiler of the A.S.T.M., resolved itself largely into a question of deciding on methods of studying the properties of an oil in order to determine its suitability for electrical purposes. It was felt that a definite distinction should be made between what may be called research tests and other tests employed for acceptance purposes. Different nationalities have at the present time different standard methods of testing for acceptance purposes, particularly for studying the properties, and the time is not ripe for replacing these by one international test. Useful work was, however, found to be possible in standardisation of the research test, and the wide field was narrowed down to four tests, eliminating a distinction which has existed between countries since the question of insulating oils was first studied by the I.E.C. at the Hague meeting a year ago.

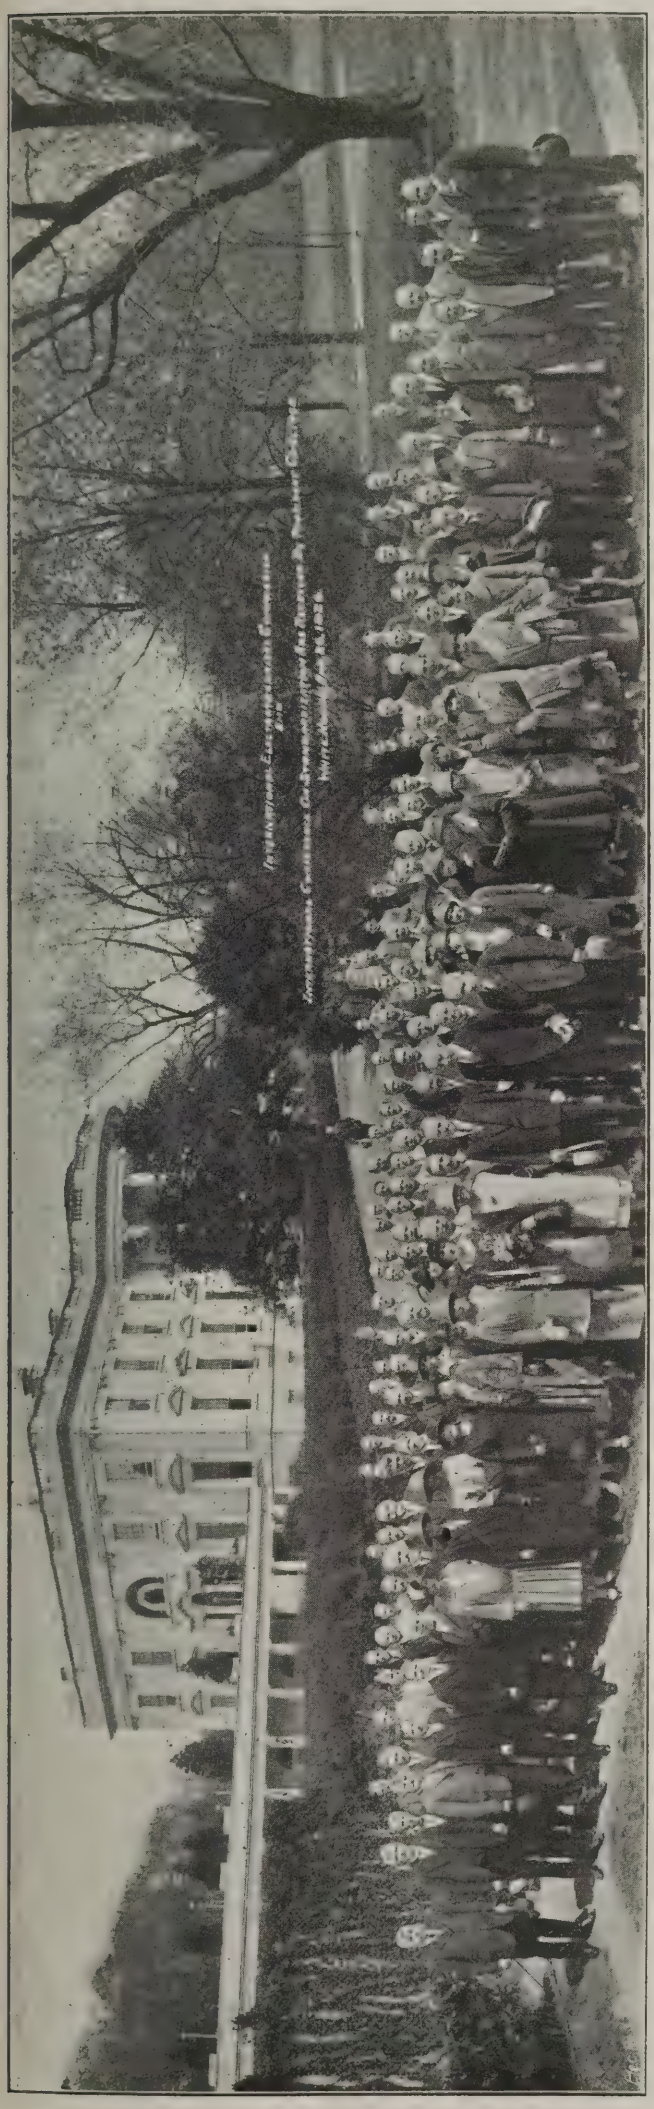
There have been three separate groups of organisers in operation in these different countries, tiding over the period prior to complete unanimity, but it has now been agreed to combine the activities of these three groups under one central office which will make for more uniform action.

In addition to the main point, sludge tests, it has been agreed that viscosity shall be expressed in kinematic viscosity units, centipoises, and for the cold test it was agreed to adopt the United States " pour " test. Both the viscosity and the cold tests must, however, be referred to the National Committees. The British delegate on this committee was Mr. A. R. Everest.

The Committee on Prime Movers, which dealt with hydraulic and steam turbines, held a number of meetings, under the very able presidency of Doctor Durand (U.S.A.). The great need of international standardisation of definitions, general conditions covering tests, and methods of making tests, was realised by all the delegates, and as a very evident desire was manifest on the part of all nationalities to adjust any points of difference for the common good of the Commission, great progress was made.

As regards Hydraulic Turbines the British National Committee, through the delegates, Mr. C. P. Sparks and Mr. F. Wallis, put forward proposals, as requested at the Hague meeting last year, and they were taken as the basis of discussion. The proposals were under two heads, Section 1 covering General Hydraulics, and Section 2 Hydraulic Turbines, and finally a report was adopted covering both these items. This report dealt with the subject in a clearly defined manner that should render it of great practical value to purchasers and manufacturers alike.

The Steam Turbine section of the Committee submitted a somewhat similar report, and added the recommendation that the Committee should develop (*a*) a commercial code on the lines of the British proposals to include matters not strictly technical, and (*b*) a strictly technical code, on the lines of the Test Codes of the American Society of Mechanical Engineers, but amplified to include methods and instruments in use in various countries.



The question of standardising lamp caps and sockets originated at the Geneva Conference, and the matter was referred to a Special Committee at the Hague meeting held in 1925. Whilst progress had been made, however, there still existed a considerable difference of opinion between certain of the various National Committees.

So far as the Edison screw type is concerned, the question was then referred to the Lamp Manufacturers' Committee, which meets under the chairmanship of Dr. Holst, with the request that that Committee should endeavour to compromise the members' views and report to the New York meeting.

Dr. Holst's Committee has given the matter much consideration, and whilst at the moment a unanimous report is not forthcoming, it is anticipated that a satisfactory conclusion of the discussions will be arrived at in the course of the next few months.

With regard to the question of the Bayonet type, it was reported at the Hague meeting that the principal difference of opinion existed between the British and French Committees, which were requested to endeavour to come to some agreement.

In the interim between the Hague and New York meetings, the two Committees have considered the question, and as the result of a meeting which was held in Paris in November last, agreement was reached. This

has been reported to the full Advisory Committee meeting held in New York, which has adopted the conclusions arrived at by the British and French Committees. At the New York meetings the British delegate was Mr. E. G. Batt.

The result achieved means that international agreement has been reached with regard to dimensions of bayonet-type lamp caps and lampholders, giving complete interchangeability of various manufacturers' products.

The Committee on Standard Pressures held three meetings under the chairmanship of Professor Lombardi, the British delegate being Mr. C. P. Sparks. The question of standardising pressures at consumers' terminals, already examined previously to some extent at Geneva and The Hague meetings, was carried a step further, and the ultimate recommendation was to adopt two alternative series of voltages as follows:—

D.C.	A.C. Single-phase.	3-phase (between phase and neutral).
110 ...	110 ...	110
220 ...	220 ...	127
440 ...	— ...	220
115 ...	115 ...	115
230 ...	230 ...	133
460 ...	—	230

The following voltages were standardised for transmission purposes:—1,000, 3,000, 6,000, 10,000, 15,000, 20,000, 30,000, 45,000, 60,000, 80,000, 100,000, 150,000, 200,000, and 300,000 volts (mean value at consumers' terminals).

These values are to be known as nominal I.E.C. pressures of the network, and the maximum pressure at the generator or secondary terminals of transformers is to be considered to be about 10 per cent. higher to compensate for line drop.

For use in new systems, the preferred mean transmission voltages are recommended as follows:—6,000, 15,000, 30,000, 60,000, 100,000, 200,000 volts, with the same 10 per cent. increase at the transmitting end. The consideration of the permissible variation of voltage was deferred until a later meeting of the Commission.

The Advisory Committee on Symbols under the chairmanship of Lieut.-Colonel K. Edgcumbe, was able to report considerable progress in the agreement on symbols for general graphical use on diagrams and lay-outs, hundreds of symbols, including about eightly more particularly suitable for use in traction lay-outs, being submitted to the plenary meeting for adoption.

The international employment of the same symbols for the various types of machine, circuit breaker, conductor rail, and overhead material—to take a few examples at random—should go a long way in the direction of simplifying the reading of diagrams and drawings without reference to any "key," a consummation devoutly to be wished.

An important discussion took place on the letter symbol for the ohm. The V for volt and A for ampere have long been accepted internationally, but as regards the third member in the electrical trinity no agreement had prior to this conference been possible.

It has now been unanimously decided, however, to adopt Ω as the symbol for ohm, and the megohm will be represented by $M\Omega$. It should, perhaps, be pointed out that this decision does not affect the use of R as the symbol for resistance, but only covers the *unit* of resistance, *i.e.*, the ohm.

There has for some time been a difference of practice in the method of indicating the polarity of a battery, when using alternate long and short strokes, as to which shall be the positive and which the negative pole. After discussion, it has now been decided to recommend to the National Committees that they should make the long thin line the positive pole, which practice appears to have ample historical precedent.

The delegates of the International Electro-technical Commission were received individually by President Coolidge at the White House, Washington, on April 24th. We reproduce herewith a photograph of the group taken in the grounds after the reception.

How the Supply of Electricity was Maintained during the Strike.

Some Interesting and Amusing Incidents.

We refer in our leading columns in this issue to the comparative ease with which the supply of electricity was maintained during the recent general strike. This and the normality, apart from reduced loads, with which very many undertakings, including large and important ones, in all parts of the country were able to carry on were the outstanding features of the situation. The Yorkshire Electric Power Co. reports no notable events during the strike; every man in the employment of the company remained at work, and the supply was given normally as required. The Birmingham Electricity Supply Department, where the men refused to act unconstitutionally in spite of definite instructions by the local trade-union branches to cease work on May 11th, was similarly fortunate, and the Sheffield undertaking was not affected in any way; Salford also carried on as usual with the full staff. Among the other undertakings which were able to operate normally, as far as the employés were concerned, were Nottingham, Carlisle (although here the men were notified three times by the unions that they were to be called out, the order being cancelled each time, due, it is believed, to reluctance on the part of the men to come out), Swansea, Manchester, Altrincham, Blackpool, Coventry, Wolverhampton, Stafford, Hereford, Birkenhead, Bury, Wigan, Dundee, Perth, Plymouth, Southampton, Barrow, Belfast, Tynemouth, Glasgow, Crewe, Liverpool, Woolwich, Bedford and Manchester. The following supply companies were also unaffected:— The Shropshire, Worcestershire & Staffordshire Electric Power Co., the Halesowen Lighting & Traction Co., Ltd., the Tewkesbury Electric Light Co., Ltd., the Kidderminster & District Electric Lighting & Traction Co., Ltd., the Ludlow Electric Light Co., Ltd., the North Wales Power Co., Ltd., and the Mersey Power Co., Ltd. The position in the Newcastle Electric Supply Co.'s undertakings was that in some of the stations the men ceased work, while in other cases they remained on duty; it is reported that the men generally were reluctant to cease work.

In many instances the whole of the manual workers left their posts at the commencement of the strike, and the supply was maintained by the technical staff with the aid of volunteers. This was the case at Poplar, St. Marylebone, Bristol, Aberdeen, and other undertakings. In some places, including Fulham, Hammersmith, Hackney, and Islington, naval ratings were introduced to replace the strikers.

In the North Metropolitan Electric Power Supply Co. the men ceased work at different times in the Brimsdown, Willesden and Hertford power stations. The St. Albans power house was not running at the time as the company was receiving the supply for this area from Luton. The Hertford station was shut down, and the supply throughout the area was maintained from the other stations by volunteers and naval men. A Diesel set was run at St. Albans in order to conserve the coal supply. During the first few days of the strike the tramways were shut down, and this relieved the system of 5,000 to 6,000 kW.

There appears to be a misunderstanding in some quarters regarding the supply at Willesden, where a bulk supply is received by the Willesden Council from the North Metropolitan Co. The Council men at Willesden left work on May 7th, and for the following three days the supply in this district was not available to consumers during the day-time. This was not due to the Willesden power station, which was originally the Council's property, shutting down; the bulk supply to Willesden was available during the whole of the strike.

At Wimbledon 133 men left work on the first day of the strike, three returning before the strike was declared off. Five naval ratings and two paid men were introduced into the station to help the loyal men, and the full supply was maintained without trouble of any kind. The Electricity Committee has agreed to pay bonuses to the total value of £368 to the men who remained loyal.

At the commencement of the strike all the men came out at Hackney; volunteers and naval ratings were drafted into the station, and the supply was maintained without trouble of any kind. In accordance with the Council's arrangements the works now constitutes an "open shop," and is to a very large extent restaffed with new men.

A few men at the Leeds undertaking ceased work on May 4th, but most of these returned the next day. On May 12th the majority of the men came out, but all the men were back at work by the 14th. The technical staff carried on without any outside help.

Thirty-three men of the Maidstone undertaking ceased work on the first day of the stoppage. On May 12th a deputation of the men told the chief engineer that they were tired of the strike and would like to return to work. A refusal of the Fulham Council to agree to the cutting-off of the electricity supply to some 54 consumers led to the cessation of work by the men, and the shutting down of the station. Three men who took part in stopping the plant have since been arrested and charged under the emergency regulations. At Stoke Newington the majority of the men came out at the beginning of the strike but the sub-station attendants returned to work on May 8th.

At several of the undertakings in the No. 5 (West Midlands) District the men ceased work, but the supplies were maintained with the help of volunteers.

West Ham reports that some of the men were out, the supply being maintained by the remainder without any outside assistance.

The men at the Valley Road Works, Bradford, ceased work as the result of the running of tramcars, but those employed at the Bolton Road works refused to follow suit, and passed the following resolution:— "That the employés at the Bolton Road electricity works disassociate themselves from the Trades Union Council in their action in calling a strike."

In two instances Government intervention resulted in the undertakings being taken out of the hands of the respective authorities. At Gravesend the entire personnel of the station left their posts, and the undertaking was taken over by the naval authorities. As the result of what appeared to be intimidation towards the staff at St. Helens by the local authority, the undertaking was placed under the control of the District Joint Board, No. 3, North-Western Area, under the instructions of the Civil Commissioner, N.W. Division. It is believed that it was the intention of the authority of the undertaking to replace the staff engineers by selected members of one of the electrical manual workers' unions. The men at Portsmouth, Great Yarmouth, and Lowestoft were out for a few days, returning before the strike was called off. At Stepney it was decided, apparently by the Authority, in spite of instructions to the contrary from the T.U.C., that the supply should be maintained only from dusk till dawn. It is reported that certain consumers whose electricity supply was cut off are considering the advisability of taking legal action against the Council. There was a shut-down at St.

Pancras on the second day of the strike. Some of the workers at this undertaking ceased work, but sufficient remained loyal to the undertaking to get going again quickly and maintain supplies for the rest of the period. The men at Rotherham remained at work as the result of an arrangement with the E.P.E.A. members not to supply the tramways. The members of the Enginemen and Firemen's Union were called out at Wallasey, but the supply was maintained with the help of voluntary labour. At Gloucester some of the men came out at first, but returned soon as the result of an agreement being reached on "essential supplies." It is interesting to note that all the men of the West Gloucestershire Power Co., Ltd., which had no hitch of any description, are members of the Electricity Supply Workers' National Association. All the industrial load at Erith was cut off on May 4th. At Weymouth threats to withdraw the men were rescinded after arrangements regarding electricity supplies to the docks had been arrived at. The Battersea station was run in accordance with the wishes of the Trade Union Council. The men at the Prescot undertaking ceased work, but the town was supplied by means of the bulk supply from Liverpool. Seven per cent. of the men of the Newcastle & District Electric Lighting Co., Ltd., were out for one day only. Believing that its action in calling out the stokers and enginemen at Ipswich had effectively closed down the power station, the local strike committee sent the following communication to the chief engineer:—"I have been instructed in so far as our members are concerned to offer to supply light and power for such services as houses, streets, shop lighting, social services, power for bakeries, laundries, and domestic purposes."

On the eve of the general strike the Executive of the E.P.E.A. passed the following resolutions:—

(1) That the essential public services in connection with the supply of electrical energy should be maintained.

(2) The Association deprecates the introduction of volunteer workers in the electricity supply industry, but in the present emergency this Executive Committee agrees that to maintain the essential public services it hereby instructs its members to co-operate in the Government scheme for the maintenance of such services.

(3) That to prevent a situation arising which may operate to the detriment of the foregoing resolutions, it is advisable for instructions to be given by His Majesty's Government to all electricity supply undertakers that to maintain the supply of energy for such essential public services, care shall be exercised that a supply of power shall not be given to an industrial works engaged in work of a non-essential character.

(4) That the afore-mentioned resolutions be officially communicated to His Majesty's Government at the earliest opportunity, and that copies of such resolutions be sent to the National Joint Board and all the District Joint Boards.

It was on the basis of the above resolutions that working arrangements were made possible in many undertakings, although, as was to be expected, numerous difficulties arose in defining what were "essential services." In spite of the conflicting instructions which appear to have been issued to the men by the various unions, union formations, local union branches and strike committees, much was done in the way of bringing about working arrangements between the staff and the men by conferences between the parties concerned in the local undertakings. It is interesting to note from the following letter received by the secretary of the E.P.E.A. from the Ministry of Transport, that the efforts of the staff during the time of trouble were much appreciated in official quarters:—

Ministry of Transport,
6, Whitehall Gardens, S.W.1.

May 11th, 1926.

Dear Sir,

I am directed by His Majesty's Government to ask you to inform the members of your Association that their action in remaining at their several posts in generating stations and in maintaining the supply of electricity has been of the greatest possible value in the present national emergency, and the Government trust that the Association will continue their splendid work in the interests of the community.

Yours truly,
(signed) Wilfrid Ashley.

In a report to his committee by the chief engineer at Cardiff, where most of the men were out during the greater part of the strike, he said: "It has to be borne in mind that the technical staff, in bearing as they did the brunt of the work involved, displayed their keen appreciation of their obligations to the community they serve, and what must be the feeling of the Committee, to maintain all supplies under all circumstances.

I cannot speak too highly of their devotion to duty, the cheerfulness and comradeship shown under adverse circumstances and unaccustomed duties, and I am sure their efforts deserve, and will receive, full appreciation of the Committee, Council, and citizens."

Another instance of appreciation by the local authorities of the loyalty of the power-station men was at Plymouth, where, at the conclusion of the strike, the Mayor, accompanied by the chairman of the Electricity Committee, Alderman J. B. Love, and the electrical engineer, Mr. E. G. Okell, visited the power stations at Prince Rock, Newport Street, Stonehouse, and Armada Street, to thank personally the 150 employés who resisted all the efforts made to induce them to cease work. The Mayor expressed the gratitude of the public to the men for standing by so loyally during the strike. The employés received the Mayor with cheers and every demonstration of loyalty to the undertaking and to the country. One of them remarked, "We stayed on not because we thought we were going to get anything out of it, but because it was the right and proper thing to do. We are honest men, and when we make agreements we are not going to be drawn by the nose by any Bolshevist agitators." At a meeting of the men at the Horseferry Road Station of the Westminster Electric Supply Corporation, Lord Wargrave (the chairman), on behalf of the directors and shareholders, expressed his warm thanks and appreciation for the loyalty and devotion to the company which the staff had displayed during the national crisis. He concluded as follows:—

"While expressing our sincere thanks, I wish you to accept, as a mark of our gratitude, a sum of over £2,000 as a gratuity, divided as follows:— Engineers £25 each, foremen £10, men £5, youths £2 10s."

As already indicated, in many places the clerical and administration staffs joined forces with the technical workers and became stokers, trimmers, "greasers," and the like. This was the position at Croydon, where the clerks handled some 50-60 tons of coal per day.

Amidst the hardships and difficulties that were met and overcome by those who "carried on," and in spite of the great seriousness of maintaining the electricity supply throughout the country in such a crisis, much food for subsequent reflection was found in the lighter side, particularly by those who were performing unaccustomed duties and others who were living at their work. The following is a copy of one of the many curious and amusing "station orders" which were posted up in various undertakings during the strike:—

May 11th, 1926.

A cordial invitation is extended to all members of the staff not actively engaged on shift duties to-morrow, Thursday and Friday mornings, 12th, 13th, and 14th inst., to join a party at 8.30 a.m.

The venue will be No. 17 boiler, and it is anticipated that an enjoyable time will be spent in clearing the boiler tubes and superheater tubes, &c., of dust.

Dress optional. Engineer and Manager.

The following is an impression of the 11-days' strike from the point of view of the volunteers on sub-station work:—

The Volunteer and the Sub-Station.

By L. S. R.

This article is written specially for the Electrical Review, because it is a review of an electrical disturbance that took place between May 3rd and May 14th,

1926. It began by the receipt of a memo. headed "National Emergency," which contained a warning to "stand by and await further instructions." The following morning our usually quiet road was thrown into a state of excitement by the roar of a sports model "Bentley" labelled O.H.M.S., which pulled up with a jerk at our domicile and pitched out the latest thing in plus-sevens (plus fours is too modest a description). Hastily thrusting a missive into my startled better-half's hands, plus-seven disappeared with another roar, in a trail of lubricating-oil haze. The missive contained the "further instructions"—report at once to U.R. —— Street sub-station. The writer having already departed for the office, the instructions were 'phoned through. Acting as directed, and knowing something of sub-stations, I dashed off to ——— Street, *via* home, where I shed the spats of respectability for the spots on the oldest togs I could find. At ——— Street all was bustle and animation. Scores of fellows were there, each eager to perform his allotted task, whilst it was yet day. A genial official entered up our names and assured us, contrary to our own beliefs, that there was positively nothing we did not know about sub-stations. Leaving him, we descended into the "sub" itself, which was being used as "H.Q. rapid-training centre." Another official—a real stout fellow this, who had already done 48 hours on duty—explained the general lay-out of the board and plant, leaving auxiliary circuits to be worried out by ourselves at the station to which we found ourselves allotted. A 10-minutes' course on starting up the station, synchronising, paralleling, &c., ensued, and then the command, "Let me see you do it." Lord! it was 17 years since I'd synchronised anything, but with a whirling brain and a trust in that little god whose especial care is toddling children and sub-station engineers, I started up. Snap! and, marvel of marvels, those rotaries dropped into step like lovers going for a country walk. Again the voice of our instructor, "right Mr. So and So—these men to report at once to ——— hurry up—car waiting." A blanket was pushed into our hands, and we were off.

At ——— Street, our home for the next eleven days, the lay-out was similar to the station we had left, so we settled down to find out how the 10,500 volts that came into the station found their way out again. As night drew on we tossed to decide who should take night shift. Two of us had all the luck, so, taking our blankets, we wedged ourselves in between the bedplates of two rotaries for our night's rest—unbroken save for the continual row of compressors, Klaxon alarms and gongs.

In the morning I found myself suffering from an acute attack of lumbago—this diagnosis proved, however, to be incorrect. My comrade and bed-fellow had shoved me hard against the makers' name embossed on the bedplate, and the letters B.T.-H. were clearly defined on that portion of the anatomy where one's back changes its name. This was particularly galling to a M.-V. man, but no doubt some B.T.-H. volunteer in another station was similarly stamped "M.-V."

With the morning came also a nice little sack of rations, labelled "One ration for one day for four men." At this point I want to take off my cloak for the lady to walk on who thought those rations out. Everything the U.R. people could provide to make us happy had been provided. A veritable bran-tub of little necessaries in neat packages. Nothing had been forgotten, even bottled beer, cigarettes, and chocolates were there, and what's more, one of our fellows was a teetotaller and non-smoker, so we other three were in luck. Each day the ration was varied—we never expected new-laid eggs—had we anticipated their inclusion, we should never have emptied out anyhow our first rations on the hard floor.

After a breakfast of bacon—minus eggs—we had a call from the Sanitary Authorities, together with a motor lorry with "England collects the ashes" painted on its sides. Six under-grads dismounted. Might they have the privilege of removing such objectionable matter as was contained in our receptacles for the accommodation of refuse? After assuring ourselves that they would endeavour not to scratch the bins and would restore them to the pavement without the accompaniment of that horrible crash one associates with their professional brethren, the privilege was accorded. Oxford and Cambridge bowed—we bowed. Oxford and Cambridge removed their head-gear—we lifted ours in response, and with a "cheerio, chaps" the combined Universities moved off in search of other dust-bins.

And so day followed day, each with its amusing experience. We "bust" nothing, we fed, we washed up, we cleaned up. From the door we revelled in the wit displayed on the sides of the motor-'buses by our fellow volunteers. Didn't the girls have a good time! At sunrise we entertained less fortunate volunteers and "specials" to early-morning tea (we mention "specials" only, as the regular police don't drink tea). In the evening we slipped out for half-an-hour to a friend's flat and enjoyed the luxury of a real settee, and a whisky and soda such as only a friend pours out. We fixed up a wireless set for news, and if some of us "nodded," the ones who kept awake told them the news afterwards.

The chief thing was that on the top of the underlying seriousness of the whole business everybody laughed. A few people had challenged the many, and the many, not immoderately but quietly, laughed. On the first day of the strike, instead of tears there was seriousness —yes! but also laughter. Nothing can survive laughter, not even a strike committee.

Well, it's all over now. We've chucked up our temporary sub-station duties—handed over again with a cheerio to the fellows who went out and came back. Reported "off" at ——— Street, said good-bye to everyone, and each received a delightful little note from Lord Ashfield, which concludes: "We shall never forget our association with you during a great national emergency, and hope that you may carry with you a pleasant recollection of the time spent with us." Sir, we most certainly shall. And now for a hot bath, clean undies, and a good sleep, for to-morrow we must put some more soot round those lettuces to kill those damned slugs.

Transformer Oil and its Treatment.

The Importance of Precautions against Contamination.

By A. D. JUKES.

Those who are interested in, and have a working knowledge of, insulating oils know that in the last seven or eight years vast strides have been made in this particular industry. This is primarily due to the efforts of the various oil companies which have made a speciality of transformer and switch oils, and to the firm stand taken by the British Engineering Standards Association.

Before the war the best grades of white, non-sludging transformer oil were produced in Germany, from Russian crude, and after a time a fairly large demand was created in this country. When the war broke out,

this source of supply was cut off, and users of insulating oil were forced to make the best of a bad job and take what they could get. This resulted in a great deal of oil of inferior quality being put in circulation. In fairness, however, it must be said that some of this oil stood up very well indeed under actual working conditions. In one case, a certain oil, which to-day would not pass standard requirements, was in continuous use in transformers from 1915 to 1922, approximately seven years, before it began to sludge badly. It may be assumed that some of this oil is still in use, but it now requires filtering about every seven months. This is not a bad record for an oil which to-day would not come up to the British Engineering Standards specification for Class B.

When the war ended, progressive oil firms began to look round for a good white, non-sludging transformer oil, and as no Russian oil was available, another source of supply was sought. In due course certain companies in the United States were prevailed upon to make an oil of this nature. Their enterprise was rewarded. Various firms in this country preached the gospel of non-sludging oil assiduously; before very long this grade of oil was very much in demand, and an increasing market was assured. It may be safely assumed that at least 90 per cent. of the transformers manufactured in this country to-day are put in operation on white, non-sludging transformer oil of American origin.

In the last couple of years other refiners in America have commenced the manufacture of a somewhat similar oil, and this, coupled with the fact that Russian oil is once more available, has brought the price down considerably. At the present time none of this white, non-sludging oil is actually manufactured in this country, but there are rumours that this is a possibility of the not far-distant future.

Under present conditions, transformer oil is supplied by the refiner, and is guaranteed to meet a definite specification, apart from the dielectric strength. It is then taken in hand by the oil merchants, dried, cleaned, and barrelled. This seems a very simple procedure, but a peep behind the scenes will be enlightening.

When a consignment of transformer oil is received in this country, samples are drawn off and submitted to a laboratory test to determine if it conforms to the guaranteed specification. As the cost of each of these tests is in the neighbourhood of three guineas, it will be realised that the expense to a firm which disposes of from six to twelve thousand barrels per annum is no small matter. When these tests are found to be satisfactory, the oil is cleaned and dried, and a dielectric test is taken on each and every barrel. If the test results are approved, the oil is then considered ready for shipment. Some firms—those which specialise in insulating oils—are not content with this alone. They allow the oil to stand in sealed barrels for a period of 48 hours, and if the oil, after that time, has a dielectric strength of less than 40,000 volts, it is returned to stock and re-treated. This is a very sound procedure, and if it were adopted by all transformer oil merchants there would be fewer failures. There are rumours that some firms do not take the trouble to treat oil for moisture, &c. If this is a fact, they are certainly asking for trouble, and should not be surprised when it comes.

There are various methods in use to-day for the cleaning and drying of transformer and switch oil, but undoubtedly the most popular and most satisfactory means is the centrifuge. There are about half-a-dozen firms manufacturing centrifugal machines for the treatment of oil; of these, the De Laval Company are the pioneers. One of the machines in use to-day by various oil companies, manufactured by this firm, has a capacity for treating from six to eight hundred gallons of cold transformer oil per hour. This means that it is possible to dry and clean approximately eight hundred gallons of transformer oil in its natural state per hour, and to give it a dielectric strength after one treatment, of over 50,000 volts—a very satisfactory result indeed.

It is absolutely essential to make a test for moisture on every barrel of transformer oil before it is put in circulation. This is of the utmost importance—notwithstanding the source of supply, the guarantees given, or the faith one may have in the supplier. If a genuine dielectric test with electrodes is not possible, a cracking test or poker test will determine whether the oil is dry. Both these tests are effective and easily carried out. For the cracking test, fill a test tube with oil and hold the base over a flame until a faint vapour arises from the oil; if there is moisture present, a cracking noise will be heard. It is generally found that where there is a very faint cracking, the oil will have a true dielectric strength of approximately 15,000 volts. If a fairly pronounced cracking is heard, the oil will probably have a strength of about 5,000 volts or under. The poker test is carried out by heating an ordinary poker or similar instrument to a red heat, allowing it to cool black, and placing it in a beaker of oil. If the oil is wet, the same cracking noise will be heard. Of course, these tests are not reliable where the oil is dirty, but dry. Obviously, dirty oil should not be put into transformers or switches.

It is an undoubted fact that most oil failures, due to moisture and dirt, are caused by the barrels. Cases have been known where oil has been treated and found to have a dielectric strength of 50,000 volts; yet it has depreciated to approximately 20,000 volts, after standing in the barrel for twenty-four hours. Possibly this can be accounted for by condensation, but in nine cases out of ten it is due to the condition of the barrels. In the past most oil merchants have been in the habit of charging for barrels, and crediting the customer when the barrels are returned in good condition. The barrels have then been swilled out with hot oil, drained, dried, and used again. This practice is certainly a risky one. If, for example, a barrel is emptied on site and left out in the rain, with the bung out, or loosely screwed in, moisture is certain to get in. This sets up rust. When the barrel has been cleaned and refilled, this may not be apparent, but by the time the barrel has been manhandled *en route* and tossed from railway to motor truck, the rust adhering to the inside of the barrel will have been loosened and mixed with the oil. When the oil reaches its destination, and samples are drawn for test, it is dirty and is probably condemned. This means that carriage must be paid back to the works, and a fresh consignment sent out. If there are facilities on site for re-treating the oil, and this is done, it will probably cost the vendor a penny per gallon, which will be deducted from the price. A great deal of money is lost every year by transformer oil dealers on this account.

There is no reason why transformer oil should not be shipped any distance in 18-gauge steel drums, and arrive on site in a satisfactory condition, provided that the oil has a good dielectric strength before shipment, and the barrel is not broken open, or the bung removed or loosened in transit. To achieve this result, however, new barrels must be used for each and every consignment. Transformer oil is delivered, in most cases, by the refiners in new 18-gauge steel barrels, with pressed-out rolling hoops. If the oil is cleaned, dried, and sent out in these barrels *once only*, the wet and dirty oil problem, apart from isolated cases, should be solved. There would be no need for 14-gauge steel and galvanised barrels with outside rolling hoops, and the consequent increase in freight charges. It would save the transformer oil merchants and the large consumers many pounds annually, as a 14-gauge barrel weighs approximately 50 lb. more than an 18-gauge.

In conclusion, the price of white, non-sludging transformer oil has reached a very low figure, and if the price is forced down much lower, it may result in the merchants disclaiming all responsibility for dielectric guarantees, and the cessation of the expensive methods of drying and cleaning now in vogue. If this does happen, the onus of responsibility for wet and dirty oil will rest upon the transformer manufacturer, and it will mean the purchase of expensive plant to do this work.

International Standardisation.

A New Standardising Body to Meet in London.

(From Our Special Correspondent in the United States.)

During the recent conference of the International Electro-technical Commission, held in New York, at which about a hundred delegates attended from a dozen European countries, a conference of chairmen and secretaries of various national standardising bodies was called to discuss the general question of international standardisation.

Several meetings were held under the chairmanship of Mr. C. E. Skinner, the president of the American Engineering Standards Committee; Sir Archibald Denny, the president, and Mr. de Maistre, secretary of the British Engineering Standards Association, supported by Sir Richard Glazebrook, Mr. C. P. Sparks, and Mr. Ll. B. Atkinson, represented the British interests.

About thirty representatives attended the discussions, which were restricted in the first place to the broad lines of considering the organising internationally of the collection and dissemination of information from various countries regarding the standardisation of matters, broadly engineering, not at present dealt with by any existing international organisation.

As is widely appreciated at Home, the British Engineering Standards Association makes no attempt to dictate to industry, but only undertakes standardisation on any particular line when it is clear that all the interested parties are in agreement that the step is desirable. Standardisation in other countries does not appear to proceed in such a satisfactory manner. There is a tendency abroad for the deliberations to proceed along academic lines, and for the manufacturer not to be given a full opportunity for expressing his views before the standards are formulated. Such a condition results in some of the foreign standardising bodies not being anything like so representative of the commercial interests as is the B.E.S.A., with the consequence that the standards do not always become effective.

International engineering standardisation has, of course, been in progress through various channels during the past ten or fifteen years, quite apart from official action of the I.E.C. and the B.E.S.A. There has, for example, been a move towards the standardisation of the shape and pitch of screw threads, and the dimensions of ball bearings, as well as of certain replaceable parts employed in engineering generally.

The war, with its development of mass production, gave a great impetus to standardisation, the importance of which was very fully appreciated first in America, where Mr. Hoover started his campaign of simplified practice, then in England, and later on the Continent. A short time ago a movement was set on foot between certain central European countries to standardise, amongst other things, the width across the flats of bright nuts, and it was at once felt by standardising bodies in other countries that if any decision on a subject of such universal interest could be made truly international a great step would be achieved for the common good. So far as this country is concerned, the B.E.S.A. saw that it could not afford to stand outside such a movement, but that steps would have to be taken towards forming an international body to deal with such matters before the separate national bodies had gone too far. The Americans were pressing for the question to be raised in New York while the opportunity existed of obtaining a free discussion between representatives of various nationalities, and full support was given by the representative British delegates.

It has not, of course, been found possible at these preliminary discussions to lay down any very clearly defined field of action, nor is too sudden a crystallisation of ideas in this direction desirable. Naturally, it will be some time before more than interchange of information is possible along these lines without any attempt to obtain international agreement on actual standards. In fact, the new organisation which has seen its birth in New York, to start with may be in the nature of an international technical association rather than a standardising association.

The important suggestion was made by that clear-sighted man, Doctor John W. Lieb, the vice-president of the new York Edison Co., that whatever was done in the direction of international investigation between countries should be done through one organisation, and that the experience and personnel of the I.E.C. should be made use of to the utmost possible extent. With a view to doing everything possible to further Dr. Lieb's suggestions, several conferences and conversations took place in New York between the various nationalities, and in spite of some little misgiving and only after the gravest consideration it was decided to go forward cautiously on these lines, allowing each country full liberty to discuss what it considered to be the proper method to further the work.

It was interesting to observe during the discussions that the proposals for organising this new international understanding had a strong backing from industry in the United States. This augurs well for the future of the movement, which, of course, cannot go forward without substantial financial support.

Prior to the opening of these New York conversations the British, Belgian and Dutch secretaries had co-operated in producing a draft organisation, and during the talks other countries, notably America, which had convened the conference and drawn up the agenda, contributed definite proposals.

In view of the 20 years' active and useful life of the I.E.C., during which it has been formally recognised by many Governments of the world as an existing means of interchange and promulgation, it was felt that collaboration between the new body and the old would result in a valuable saving of energy and overlapping of effort which, while leaving the I.E.C. entire liberty of action, would result in much all-round economy. It was frequently observed, too, during the discussions that with the B.E.S.A. and the I.E.C. working side by side under one general secretary, Mr. Le Maistre, has on all occasions acted internationally in the affairs of the latter body; the recognition of this fact no doubt had considerable influence with the various foreign delegates in bringing them ultimately to a decision to recommend unanimously to the national standardising bodies that the central office of the new body should be in London, and be run in intimate contact with the central office of the I.E.C.

A constituting committee of seven was appointed to receive the replies of the national standardising bodies, and this Committee will meet in London under the chairmanship of Sir Archibald Denny some time before the autumn, to take matters a step further towards setting up the machinery for actually carrying on the work.

The British delegation was ably led by Sir Archibald Denny, and throughout the discussion Sir Richard Glazebrook, who for forty years has taken such an active part in international movements, did yeoman service. The assistance rendered during difficult passages by Mr. Ll. B. Atkinson was also of the greatest value.

Indeed, the confidence and respect accorded to the British delegation when differences of opinion had to be adjusted, have added considerably to the prestige and reputation which this country enjoys in international technical fields. The British point of view has never been more adequately advanced nor has it been received with such respect, and we shall anticipate with a lively interest the growth of this technical League of Nations.

Parliamentary News.

[By Our Special Parliamentary Reporters.]

Insulation of Electric Cables.—On May 17th Mr. DAY asked the Minister of Labour if his attention had been drawn to the death of Edward Cox, Battersea who came into contact with an uninsulated wire when working on the South London Tube extension at Trinity Road station; and, in view of the danger to workmen engaged on such undertakings, would he cause regulations to be made with a view to all electric cables being insulated.

Col. ASHLEY, who replied, said that his attention had been called to the accident. He was making certain inquiries, and proposed to consider, when these were complete, whether there was any action that he could usefully take.

Leicestershire and Warwickshire Electric Power Bill.—This measure was read a third time in the House of Commons on May 4th and in the House of Lords on May 14th.

Lighting in Lanarkshire.—On May 18th, Sir A. SPROT asked the Minister of Transport what was the present position of matters as regarded the obtaining of wayleave from certain proprietors to permit of the laying of an electric cable, the want of which was holding up the public lighting of the Salsburg district, Lanarkshire.

Col. ASHLEY said that objection had been taken to the Power Co.'s application for the wayleaves referred to, and a further inquiry, for which he hoped to make arrangements at an early date, would be necessary.

The Broadcasting of News.—On May 19th, Mr. DUCKWORTH asked the Postmaster-General whether he would arrange for the British Broadcasting Co. to continue permanently to broadcast part of its special service of news and comment initiated during the recent emergency.

Sir W. MITCHELL-THOMSON said that the arrangements for the distribution of news by means of the British Broadcasting Co.'s stations were governed by an agreement between the company and the Press. This agreement would expire with the termination of the present licence to the company on December 31st next, and the new broadcasting authority which it was proposed to set up would be free to make fresh arrangements.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Strike Profiteering.

During the recent strike, we were carrying out an urgent job in North London, under difficulties, and requiring some additional material, we courteously invited a local electrical contractor of, obviously, some standing, to oblige us with these materials, explaining the difficulty in transporting goods, and offering to pay 10 per cent. over and above the usual trade prices to compensate him for his trouble.

Imagine our surprise, when we were informed that he would only supply us at prices approximately *double* those usually charged.

It would be interesting to learn if any of your readers have experienced similar cases of rank profiteering.

Henfrey Electrical Installations,
HY. FREEDMAN, *Proprietor.*

London, *May 18th*, 1926.

Engineers and Labour Disputes.

Mr. Thomas Carter, in the excellent and inspiring paper which he read before the I.E.E. a few months ago, urged the need for engineers to take a greater part in public life, pointing out that it was the work of engineers in the past which had changed a simple mode of life into an extremely complex one, and therefore it was the duty of engineers to endeavour to devise some means of lubricating the industrial machine which had been built as a result of their inventions and labours

Now, while it is perfectly true that some engineers are, by their nature and training, eminently fitted for dealing with the many complex problems of modern industrial life, it is a fact that no body of men is more ignorant than engineers are regarding the history and principles of industrialism; and it is during crises such as we have just experienced that we realise the extent of the average engineer's ignorance regarding the troubles liable to occur in the industrial machine.

Here is a serious disturbance occurring on an elaborate high-tension system, and we have the unedifying spectacle of a large body of highly trained men excitedly discussing the merits and demerits of the indicating instruments, instead of attempting to acquire some knowledge of the system affected with a view to ascertaining the cause of the trouble; and, because the problem is one outside their accepted province, they fail to appreciate their illogical position.

In other words, the average engineer anathematises the trade unionist without knowing anything of trade unionism, and preaches class distinction without realising the modern tendency towards its elimination.

Presumably we are all agreed that engineering problems can only be solved satisfactorily by men well trained in engineering principles and capable of studying the various phases of those problems. Why, then, can we not be logical enough to study the fundamental principles and growth of industrial problems before accepting solutions propounded by someone possibly even more ignorant on the subject than we ourselves?

Scurrilous abuse of trade unions and employers' federations, as served up by a sensational Press, is not a scientific method of solving the complicated problems presented by the elaborate industrial machinery developed during the past two centuries; and if engineers would study the economic growth of that machinery and learn something of the troubles which have occurred during its history, they would be more capable of finding a sound solution than are those who wildly advocate the smashing of unions and the blatant recognition of the class war, with powerful corporations on one side and a disorganised rabble of free labour on the other—possibly with technical employés in the superior position of complacent neutrals.

T. H. R.

Rugby, *May 15th*, 1926.

[Our correspondent appears to have been upset by some occurrence which has not come to our knowledge. We do not agree with his view that engineers as a body are ignorant of the history and principles of industrialism; nor do we accept his statement that the average engineer is hostile to trade unionism and preaches class distinction. The "scurrilous abuse" that he mentions is surely imaginary.—EDS. ELEC. REV.]

The Resistance and Heating of Lampholders.

As manufacturers of lampholders from 1882 until 1902, when we gave up their manufacture, we were naturally interested in the article on "The Resistance and Heating of Plunger-type Lampholders" which appeared on page 689 of your issue of April 30th.

The last patterns of B.C. lampholders which we made embodied this feature, and we believe that Messrs. Dorman and Smith, of Manchester, were at the same time making another pattern which contained a spring plunger device.

These improvements, introduced some 25 years ago, so far as we were concerned, did not, however, receive sufficient recognition to warrant a continuation of manufacture. Probably the reason for this was because B.C. lampholders were not called upon to carry such heavy currents as they are nowadays, when the tendency is to burden these articles with currents far in excess of those for which they were originally designed.

To meet these heavy loads, improvement in carrying capacity is, to-day, most essential, and, unfortunately, the need has arisen when the articles have become very competitive in price, the result being that slight additions in price are looked at unfavourably.

Our own pattern, a sample of which we send herewith, has spring plungers, constructed in accordance with our Patent No. 367 of 1901.

This construction, you will notice, depends upon a stud extension of the terminal, and on this a hollow four-slotted plunger slides, the inward set given to the four prongs of the plunger providing an efficient sliding contact between the terminal and the plunger, independent of the spiral spring.

In Messrs. Dorman & Smith's pattern, we believe that the plunger was solid, split in two, and sprung outwardly, sliding within a tube in a similar manner to that shown in fig. 1 (*a*) of the article referred to.

A. P. Lundberg & Sons.

London, *May 3rd*, 1926.

Country-House Fires.

In your issue of April 23rd a gentleman, signing himself "Engineer Surveyor," says his attention had been directed to my letter, which statement I take to imply that he was writing in a representative capacity; he takes exception to my statement that "Insurance companies do not *cause* very careful tests to be made." I am willing to substitute for the word *cause* the word *insist*. The report form certainly asks for particulars which are more honoured in the breach than in their fulfilment, for the very reason, perhaps, that "Engineer Surveyor" gives, *i.e.*, the disinclination of some clients to be bothered; still, it is the duty of the trade to educate the general public to the need and prudence of inspection by independent and qualified engineers, as in the case of boilers, because you might as well be blown to atoms as be roasted alive, and the multiplication of the risks is certainly a call to action on the part of those most nearly concerned.

"Engineer Surveyor" says that objection is often taken to the inspector getting access to all points to take out lamps and test each sub-circuit. Is this necessary? If the inspector uses a little diplomacy he will usually get more latitude than is absolutely necessary.

But what I object to in "E.S.'s" letter is its general tone and cheap sneers at companies other than his own ring clique; he seems to think that I made an attack on insurance companies and their surveyors, which I did not, and I am glad that he concedes my main contention, that all installations should be compulsorily examined occasionally.

J. Price.

Manchester, May 5th, 1926.

The Heating of Buried Cables—Report No. 2.

With reference to Mr. Fawssett's letter to your journal, a copy of which has been sent me by the courtesy of the Director of Research, I think Mr. Fawssett's remarks now make the matter perfectly clear.

I would, however, point out with reference to his statement that "None of the values of the thermal resistivity given in the report are affected;" that this must not be taken to mean that my statement is incorrect, *viz.*, that you get a wrong resistivity by taking Equation (25) in the form given in the I.E.E. journal.

I ought, perhaps, in explanation of my attitude, to point out that about a year and a half ago, in trying to check the values for the resistivity given in the tables published in the Institution *Journal*, I found I could in no way reconcile these (for three-core cables) with the formula. I spent the best part of a day over the matter and, owing to pressure of other work, had to give it up, thinking that I must have made some egregious mistake.

Then, perhaps a year ago, the results of an actual test on a three-core cable by a leading firm of cable makers came into my hands and I could again in no wise reconcile the temperature attained by the cable with the value of the resistivity as given in the tables published in the I.E.E. *Journal*. The possibility of Equation (25) being wrong seemed to me at that date too dreadful to contemplate, and again I had to leave the matter, after spending several hours, with the firm conclusion that something was wrong, but I did not know where. I was, in fact, on the point of writing to the cable makers to tell them that I thought there must be some mistake in the tests, but fortunately decided not to do so!

Last, about a month ago I found it necessary to return to the charge, and this time determined to get to the bottom of things, with the result that I found the discrepancy in the equations, as given in the two reports.

It is quite possible that others besides myself have been through this painful experience, and I hope, therefore, that Mr. Fawssett will not consider that I was doing him any injustice in letting the matter be known as early as possible for the benefit of saving others from falling into the same trouble.

As Mr. Melsom was always the one who replied to discussions on this question at the Institution meetings—at any rate, those discussions which I attended—I took it that he was the one who was primarily concerned in the mistake, and that is why I have not troubled Mr. Fawssett in the matter.

I hope he will exonerate me from any desire to overlook his excellent work in this connection.

A. M. Taylor.

Birmingham, *May 19th*, 1926.

Burgh of Hamilton—Electrical Engineer.

Under the above heading an advertisement appeared in the Electrical Review on April 23rd, 1926. In the same issue in the "Personal" column appeared the following: "Mr. W. J. Cooper, acting electrical engineer at Hamilton Electricity Works, has been appointed electrical engineer for the Burgh of Hamilton."

Extract from the Electrical Review, May 14th and 21st, 1926, "Personal" column: "We are informed that the appointment of electrical engineer for the burgh has been made by Hamilton Town Council. By 11 votes to 3 Mr. W. J. Cooper (at present acting engineer at the Hamilton Corporation Electricity Works) has been appointed."

Why did they ask for nine copies of testimonials when one would have been sufficient?

Curious.

May 21st, 1926.

[As stated in our issue of April 30th, p. 706, the announcement in our "Personal Column" on April 23rd was premature.—Eds. Elec. Rev.]

Electricity Meters.

In your leaderette on "Electricity Meters" you give the impression that meters generally tend to go slow rather than fast, but, particularly on the alternating-current meters, there is a possibility that many of them may run fast after a certain period of service owing to the instability of the magnets.

There is no doubt that during the war, and even prior to and since the war, there were many makers of magnetic steel in this town who understood very little about the essential properties of magnets, not only as to how essential it was that the magnets should be stable, but as to how to make them stable. Some of the firms which were supplying magnetic steel had not even got the apparatus for testing it; and some did not magnetise the steel and had a most rudimentary idea as to how it should be done. Fortunately there were some makers who employed fully qualified people to advise them, and these remarks only emphasise the absolute necessity of having proper testing equipment and testing service for all consumers' meters.

I am, personally, of the opinion that meters should not be allowed to be out more than from three to five years without a thorough overhauling and testing, yet it is safe to say that over 50 per cent. of the meters in the country are not looked at oftener than once in ten years. In many cases, the practice is to look at a meter only when it has stopped, or when the consumer has left the premises and there is no chance of current being used for some time.

More up-to-date towns have a systematic testing and overhauling of meters whether they want it or not.

Permanence.

Sheffield, *May 21st*, 1926.

Reviews.

Electrical Circuits and Machinery (Vol. III, Experiments). By J. H. Morecroft and F. W. Hehre, Columbia University. Pp. viii + 165; figs. 83. London: Chapman and Hall, Ltd. Price, 10s. net.

The present work completes a series of three books by these well-known American authors, the others having been concerned with the theory of direct and alternating currents respectively. It is intended as a laboratory guide for students who are primarily concerned with a branch of engineering other than electrical and who have but a limited time available for practical electrical work. The authors suggest that the experiments described can be performed by devoting one period per week for one session (which should be allocated to one of the later years of the course taken by the students) to the work, but it seems probable that rather more time would be necessary to obtain the most effective results.

The experiments included in the book are, for the most part, concerned with machines (both direct and alternating current types being considered) and special attention is devoted to the operating characteristics of the appliances under consideration, a method which can be well commended when instructing students of the type mentioned. Of special interest are the descriptions of certain tests in which use is made of a telephone as the indicating instrument in connection with the localisation of earths in armatures and with the determination of the wave form of alternators. A noteworthy omission is the absence of any material relating to temperature rise tests on machines, surely an important matter for the class of engineers for whom the book caters, and an account of a form of Hopkinson test would also be a useful addition.

The chief criticism that we wish to make is in regard to the poor heading of some of the columns in the blank forms for test results. It is important, when recording results, that the name of the quantity and the name of the unit should be expressly indicated in connection with each number booked, but in this work we sometimes find columns headed with the name of the quantity, sometimes with the name of the unit and rarely do we find both pieces of information included.

The authors understand the requirements of students and appreciate the points needing particular stress and this is very clearly shown in the collection of interesting questions, usually qualitative, at the end of each section. It is only possible to obtain the maximum value out of a book dealing with experimental work if the instructor in charge of the class takes pains to amplify the necessarily general information given in the book with detailed help in regard to the particular machines and appliances used in his laboratory, and, if such instruction is efficiently conveyed, we can heartily recommend the volume under notice.

In a list of other works by the same authors we notice that not only are the numbers of pages and figures mentioned but also the dimensions of the pages in *inches*, this seems quite a useful piece of information and might be more generally included. The idea of re-commencing the numbering of the figures in the second part of the book (dealing with alternating current work) cannot be commended and seems likely to lead to confusion.

A Treatise on Electricity. By F. B. Pidduck. Second Edition. Pp. xiv + 664; figs. 385. London: Cambridge University Press. Price, 21s. net.

This is a text book for honours students of physics and the whole of the very wide field now included in the science of electricity is very adequately covered. The book opens with a brief mathematical introduction dealing with vectors and leading up to Stokes's Theorem and Laplace's Operator. A note on Bessell's Functions is also included in this section.

Permanent magnetism, electrostatics and electric currents are dealt with in successive chapters, and then follow chapters on magnetic effects of currents, thermo-electricity, induced magnetism and induction of currents. All these are sound solid stuff upon which the student may confidently build up his knowledge of either the pure or applied branches of electricity. In view of the essentially mathematical and theoretical nature of the general treatment of the whole subject there is little or no justification for the inclusion of a chapter on applied electricity, and, indeed, it is difficult to find in what respect this chapter is more "applied" than any of the others, for surely a triode valve is no less an application of electricity than is a dynamo or an arc-lamp.

The chapter designated applied electricity really deals with electromagnetic machines, and this is followed by a section on electrolysis. In these chapters the author ably elaborates the outcome both in theory and practice of Faraday's two mighty discoveries: the electromagnetic effect and the laws of

electrolysis. In fact, we may look upon the first ten chapters of the book as covering the ground mapped out by Faraday; the second half of the volume deals with the new territory which has been opened up to us during the last fifty years.

This new territory is explored very thoroughly in five excellent chapters on electric oscillations, electricity in gases, Röntgen rays, radioactivity, and the electrical theory of matter. The first of these, commencing with the theory of condenser discharge and the production of electrical oscillations, proceeds to the experiments of Hertz and then treats of the thermionic valve and the subsequent development of modern wireless communication.

The section on electricity in gases is a concise and authoritative account of this subject from the early experiments of Crookes to the modern work of Aston and Rutherford, and the only fault the reviewer would find is in the somewhat scanty treatment of Sir J. J. Thomson's early classical work on the nature and properties of the electron. Radioactivity and the theory of the nuclear electronic atom are dealt with in the last chapters, and the latter subject has been brought up to date so as to include the most recent developments of the Bohr-Rutherford theory.

The book is well produced and has an exceedingly complete index. Its broad and thorough treatment of the established facts and the new theories of electrical science will assure for it a place among the standard works on the subject.

P.H.S.K.

National Economics for Britain's Day of Need: The Solution of the Unemployment Problem. By Edward Batten, M.I.Mech.E. Pp. xi + 217. London: Sir Isaac Pitman & Sons, Ltd. Price, 5s. net.

The book has been written out of the conviction that although war and destruction compel poverty and want, it is only the feeble and the foolish who can accept and believe the proposition that our idleness is as compulsory as our destitution. The author works along the lines that the problem to be solved is one of liabilities and assets with regard to the rationing of the people, and compares the rival systems of production, competitive or individual, and non-competitive or socialist. Much food for thought in connection with our modern national problems is contained in the chapters criticising and comparing the different political aspects of them, and in this direction the chapter on "Foreign Trade Regulation by a Socialist State" is particularly interesting. The author visualises the trade relationship between Socialist Britain and a protected country. Chapters on the influence of tariffs, preferential trading and selective tariffs, dwell much on modern politics, while "Money and the Gold Standard" and "Inflation and Deflation," are chapters which will be read with much interest by speculative and business men. The appropriate remedy for the injurious effects on British trade of the monetary policies of foreign countries, says the author, is to be found in our own wise monetary regulation. "The solution of the problem is the adjustment of the internal purchasing power of domestic money to constant parity with the external selling price in gold of the exported products of national industry."

Radio and High-Frequency Currents. By E. T. Larner. Second Edition, enlarged. Pp. vii + 61; figs. 25. London: Crosby, Lockwood & Son. Price, 2s. 6d. net.

This little manual gives a concise outline of the general principles of radio-telegraphy, and this edition includes also a chaper on radio-telephone transmitters.

It is especially suitable for students and amateur radio experimenters who have an elementary knowledge of mathematics and the principles of electricity, and who are desirous of obtaining a clear grasp of the general methods by which radio messages are sent and received.

It would be a mistake in a book of this size to attempt anything outside the barest fundamental principles, and Mr. Larner does not commit this error.

Short wave working is not touched on at all, but on page 2 the sentence "For short ranges short waves are used, whereas long waves are required for transmission over long distances," should have been omitted in this revision.

The information given is clear, concise and well arranged, and the book should fulfil well the purpose for which it was written.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Sic Transit.—We know not whether to congratulate our esteemed contemporary, the *Electrician*, upon its determination to "miss publication entirely" during the recent emergency, or whether our congratulations should be offered to the electrical industry. The Editor makes no apology—far from it! He appears to be proud of the fact that at last, for the first time in his journal's long history—which, of course, means since it was born in 1878—two weeks passed without the proprietors being able to issue "some sort of a sheet." As for ourselves we supposed that the national policy was to carry on and to keep smiling—to shut down entirely were easy for any of us—so we struggled during a fortnight with all sorts of difficulties and did our best to keep the electrical profession and industry informed through the medium of a weekly Electrical Bulletin which meant hard work and considerable expense. We *did* try, but now, alas, must we feel that we have done the thing that we ought not to have done. Truly there is no health in us! Anyhow, we have the satisfaction of knowing first that our efforts were appreciated, and secondly, that our records were kept up to date by the presentation of the Special Supplement with our last issue.

E.D.A. Activities.—We have received from the British Electrical Development Association a selection of publications—old and new—touching upon many phases of the use of electricity. The principal of these is a brochure describing, with illustrations, the Electric House at Olympia, with its contrasts of Mid-Victorian and neo-Georgian methods. Another useful pamphlet contains an article on salesmanship by Mr. V. W. Dale. In addition to these there are illustrated leaflets dealing with the ease of electric washing and cooking, and the comfort and cleanliness of electric lighting and heating.

Unemployment.—One serious effect of the coal mining dispute and the general strike has been a considerable increase in the number of persons registered at the Employment Exchanges. At May 10th the total was 1,576,000, as compared with 1,105,000 on May 3rd—an increase of 470,000.

Australian Tariff Amendments.—The new Commonwealth Customs Tariff, which has been passed by the House of Representatives, but not yet ratified by the Senate, provides, *inter alia*, that coal-cutting machines shall be admitted free of duty under the British preferential tariff; the duty under the intermediate tariff is 5 per cent., and under the general tariff 10 per cent. The rates for X-ray transformer apparatus, other than that designed exclusively for deep therapy, are, respectively, free, 10 per cent., and 20 per cent., but on and after July 1st, 1926, the rates are to be increased to 27½ per cent., 35 per cent., and 40 per cent.

The British Industries Fair, 1927.—Activities in connection with next year's British Industries Fair have commenced somewhat earlier than usual and we have already received the preliminary prospectus of the Birmingham section. This states that the Birmingham Fair will be held at Castle Bromwich Aerodrome from February 21st to March 4th, and the buildings are being considerably enlarged, giving a total floor area of nearly 200,000 sq. ft. The reduced price for space which was instituted this year is to be maintained and for an overall charge of £10 a "counter display" can be arranged and maintained by the Fair authorities for any exhibitor who has only samples to show and does not wish to employ attendants, although, of course, representatives can be placed in charge if desired. Arrangements are being made to keep visitors to previous Fairs fully acquainted with what is going on. As in previous years the exhibits are classified in eleven groups and although electricity is not one of them, we anticipate another good electrical display. Mr. T. R. Martin (J. H. Tucker & Co.) has been appointed chairman of the Fair Management Committee.

Swedish Electrical Exports.—The official foreign trade returns show that during 1925 Sweden exported electrical generators to the value of 21,000,000 kr. (£1,155,730), as compared with 17,492,000 kr. (£962,680) in 1924. The exports of telephone and telegraph apparatus were valued at 7,006,000 kr. (£385,580). as against 7,519,000 kr. (£413,810) in 1924.

Belgian Company's Developments.—At the annual meeting of the Société des Ateliers de Constructions Electriques de Charleroi, recently, the chairman stated that arrangements had been completed for the production of a new series of up-to-date electrical machines, and that in the company's cable factory, plant had been installed for the manufacture of long-distance telephone cables.

The F.B.I. and the French Debt.—In a letter to the Chancellor of the Exchequer, the Federation of British Industries states that French industry is enjoying very substantial advantages in competition with British Industry by reason of the heavy subsidy in relief of French taxation which is involved by the payment of interest on the French debt by British taxpayers. In addition, the sale of competitive French products is aided by the depreciation of the French currency and the high import tariffs which have been instituted. In these circumstances the Federation says that no settlement with France will be regarded as satisfactory which does not take these factors into account, and it is hoped that any settlement will provide for substantial annual payments in respect of the debt, for the stabilisation of the finance and currency of France, and for some relaxation of the French tariff policy.

Power Companies and the Sale of Appliances.—In its May issue *The Electragist*, the official organ of the American contractors and contractor-dealers (" Electragists ") criticised the American supply companies' sales policy on several counts. In the first place the wisdom of selling appliances by instalment payments spread over as long as two years is questioned. This practice is also condemned as being inimical to the interests of electrical dealers; it is said that only department stores, which will not " service " appliances, can compete on these terms. The companies' contention that they must sell appliances to absorb their power is considered ridiculous, as it is alleged that their activities result mainly in the sale of washing machines, vacuum cleaners and other appliances which consume practically no energy. Figures prepared by a typical company are reproduced showing that the appliances of this nature represented 48 per cent. of the sales; 32 per cent. was accounted for by the sale of installations, while only 20 per cent. was due to the sale of cookers, refrigerators, signs, and other devices which consumed a larger amount of energy. *The Electragist* says: " A utility is first and foremost a manufacturer and distributor of electric energy. It is entitled to build its load and develop its service. . . . The public is entitled to the widest use of energy at the minimum rate. If a utility makes it difficult for other retailers to compete except with inferior articles, the public is not being served in the manner to which it is entitled. If this aggressive policy results in a mechandising loss, such loss is capitalised and the public penalised. And if the loss so incurred is not absorbed by the profit on the energy revenue from the sale, then the public is victimised."

New Municipal Showrooms and Offices.—The Ilkley Urban District Council has applied to the Electricity Commissioners for sanction to a loan of £5,500 for the erection of offices and showrooms for the Electricity Department.

" Ediswan " News Bulletins.—During the General Strike when news was hard to obtain, the Edison Swan Electric Co., Ltd., rendered a real public service by reproducing the bulletins which were broadcast by the B.B.C. and distributing copies grati over a wide area of London. The company had the special permission of the authorities to perform this service, and it was actively assisted in the distribution of the bulletins by the managements of theatres, kinemas, hotels, clubs and business houses. The accompanying picture shows the commencement of the distribution of the final issue of the " Ediswan News Bulletin." The company also made special arrangements for the distribution of its radio products during the emergency, special supply bases having been arranged in advance at Birmingham, Liverpool and Newcastle.

The " Ediswan News Bulletin" being distributed.

South African Customs Duties.—The *Board of Trade Journal* publishes a list of proposed amendments to the Customs Tariff of the Union of South Africa. The list includes " machinery for the conversion and transformation of electric power " upon which it is proposed to raise the maximum duty to 5 per cent. *ad valorem*. Batteries (primary and secondary) are to be subject to higher rates, including 12 per cent. upon batteries for radio purposes, 15 per cent. for automobile batteries, and 10 per cent. for other types, plus a suspended duty of 15 per cent. *ad valorem*. It is proposed to admit welding electrodes free of duty; at present they are only admitted free upon certain conditions.

Hungarian Tariff Reduction.—With the object of encouraging the development of the motor industry in the country, the Hungarian Government has temporarily reduced the import duty on electrical ignition, starting, and lighting equipment, without storage batteries and lamps, to one-tenth of the scheduled tariff.

Catalogues Wanted.—Mr. J. D. Bryan, electrical contractor, who has removed to 513, St. Vincent Street, Glasgow, C.3, wishes to receive catalogues and lists.

Irish Free State Electrical Imports.—The imports of electrical goods, excluding machinery, into the Irish Free State during March last were valued at £38,065, as compared with £26,997 in March, 1925. The imports for the first quarter of the current year are officially returned at £129,187, as against £73,404 in the corresponding period of 1925.

Contractors Visit Lamp Works.—Over 70 members of the Electrical Contractors' Association from Nottingham, Leicester and Birmingham were the guests of the General Electric Co., Ltd., in London on April 29th. They were conveyed in parties on arrival to the Osram-G.E.C. lamp works, where many interesting processes were inspected in lamp and valve manufacture. After luncheon the visitors were taken to the Wembley glass works, where they saw glass tubing being made for the Osram Lamp Works, and bulb blowing by automatic machinery. A tour was then made of the research laboratories of the company, where guides explained the nature of the work being carried out.

Swedish Turbines for Japan.—*Swedish Export* says that the Kristinehamm Works of the Karlstad Engineering Co. has recently received an order for three high-pressure water turbines to be installed in Japan. The aggregate capacity of the turbines is 60,000 h.p. This contract has been received after severe competition with the most prominent turbine builders abroad. The firm has already installed turbines at many of the Japanese hydro-electric works.

Trade Announcements.—The annual staff outing of the London Electric Wire Co. & Smiths, Ltd., has been arranged for June 5th, and the head office at Golden Lane, E.C.1, will be closed on that day. A small staff will, however, be in attendance during the morning to deal with urgent matters.

The Suffolk Iron Foundry (1920), Ltd., has appointed the British Oxygen Co. sole selling agents for its " Ferro-Silicon," " Super-Silicon," and " Sifbronze " welding rods. The agency will include Great Britain, Northern Ireland, Irish Free State, India, Australia, and New Zealand.

The Automatic Telephone Manufacturing Co., Ltd., states that its Liverpool registered telegraphic address is now " Strowger, Liverpool "; and telegrams to its London office, Norfolk Street, Strand, W.C.2, should be addressed: " Strowger Estrand London."

The radio apparatus manufactured by Messrs. C. A. Vandervell is stocked at Shaftesbury Avenue, W.1, Newcastle-on-Tyne, Birmingham and Glasgow by Messrs. Joseph Lucas, Ltd., and at Leeds and Bristol by Rotax (Motor Accessories), Ltd.

Messrs. Alex. Brown & Co. have removed to 113, West Regent Street, Glasgow.

Catalogues and Lists.—Messrs. Gent & Co., Ltd., Faraday Works, Leicester.—Leaflet 36E, containing details and prices of power bells and accessories, and Leaflet 57C, dealing with electric-motor sirens.

Autoveyors, Ltd., 84, Victoria Street, S.W.1.—A priced and illustrated leaflet describing the company's " thermionic relay."

Messrs. L. McMichael, Ltd., Wexham Road, Slough.—Two illustrated and priced pamphlets dealing, respectively, with the company's 7-valve supersonic receiver and a vernier condenser dial.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—The " Osram Bulletin " for May, containing descriptive articles and notes relating principally to " Osram " lamps and valves. Also a priced and illustrated catalogue and a folder advertising " Freezor " fans.

Messrs. L. G. Hawkins & Co., Ltd., 30-35, Drury Lane, W.C.2.—A folder advertising the " Universal " electric curling iron.

Delco-Remy & Hyatt, Ltd., 111, Grosvenor Road, S.W.1.—A brochure containing a simple detailed description of the " Delco-Remy " coil ignition system. Illustrated.

The Hart Accumulator Co., Ltd., Stratford, E.15.—A coloured showcard advertising " Hart " batteries for radio, automobiles, lighting, &c.

Venner Time Switches, Ltd., 45, Horseferry Road, S.W.1.—A card advertising the company's time switches, with a topical allusion.

British Insulated Cables, Ltd., Prescot, Lancs.—A general descriptive catalogue containing particulars of cables, joint boxes, tramway material, welders, etc.; a catalogue of " Prescot " house fuse boxes; and leaflets dealing with the company's insulating varnishes and fault-localising apparatus.

Switchgear & Cowans, Ltd., Elsinore Road, Old Trafford, Manchester.—Descriptive Section No. 27, containing illustrated particulars of single-phase and polyphase induction regulators for hand, motor-operated, or automatic voltage control. The principles, design and construction are very fully set out.

Messrs. Marelli & Co., Ltd., 19 and 20, Garlick Hill, E.C.4.—Pamphlet L/711, illustrating and describing the company's oscillators and revolving ceiling fans.

Callender's Cable & Construction Co., Ltd., Hamilton House, Victoria Embankment, London, E.C.4.—Twenty-four-page pamphlet entitled " All Over the World," " The Drum of Empire "—a Callender drum, of course. It contains some notes on the building up and development of the company's business, accompanied by a series of pictures of many places in different parts of the world where their cables are in service.

Messrs. E. Brook, Ltd., Empress Works, Huddersfield.—A folder advertising " Brook " induction motors.

Messrs. McCormick & Butler, 121, Victoria Street, S.W.1.—Two folders advertising the firm's " Indurite " moulding powder and moulded products.

Messrs. James McMillan & Co., Clun House, Surrey Street, Strand, W.C.2.—A card bearing particulars of cables and wires of Swedish manufacture.

Bankruptcy Proceedings.—B. G. THOMPKINS, Stanley, Durham, radio engineer.—The receiving order in this matter was made on debtor's own petition. The statement of affairs showed liabilities of £255 against assets of £110. The first meeting of the creditors was held recently at the Official Receiver's office, Newcastle-on-Tyne, when the case being a summary one was left with the Official Receiver as trustee of the estate. The following are creditors :—

	£		£
Cooke & Whitfield Wireless, Ltd.	38	Newcastle General Supply Co., Ltd.	28
Hicks & Schofield	32		
Modern Radio, Ltd.	42		

G. R. SPARROW, 11, Cloudesdale Road, Balham, late of Brixton, electrical engineer. The following are creditors :—

	£		£
Electrical Accessories	66	Native Lamp Co.	23
Chapman, Mrs.	52	Russell & Amholtz	20
Toomer, T.	25	Holness, J. C.	105

F. F. GREGORY, 2a, Westbourne Road, Luton, Beds., electrical engineer.—The receiving order in this matter was made on April 24th on debtor's own petition. The first meeting of the creditors was held on May 11th at the Official Receiver's office, Northampton. Public examination June 17th, at the Court House, Luton. The following are creditors :—

	£		£
Berry's Electric, Ltd.	35	Pope's Electric Lamp Co., Ltd.	34
Bankers	163	Sun Electrical Co., Ltd.	52
Gregory, H.	96		

CARR & CHILDE, wireless accessories agents, 38, Park Row, Leeds.—A receiving order was made against this firm in February, 1925, upon the petition of Ashley Wireless Telephone Co., Ltd., creditors for £567, and last week the debtor G. S. Childe applied to Mr. Registrar Warnington at the London Bankruptcy Court for an order of discharge. Mr. Walter Boyle, Senior Official Receiver, reported that the liabilities amounted to £619, and the assets, valued at £51, had realised only 19s. 1d. In 1922 Carr commenced business in Leeds, and in the following year the applicant paid him a premium of £500, and £250 as business capital for a half share in the concern, in which Carr then invested £250 as capital. In November, 1923, requiring more capital, they transferred the business to Carr & Childe, Ltd., for £500 in shares, and £400 in cash, which was paid to the creditors of the firm. The debtors attributed their insolvency to (1) failure to meet overhead expenses; (2) failure by the petitioning creditors to deliver goods in agreed time; and (3) lack of capital. His Honour granted a discharge subject to judgment for £30, to be satisfied by an immediate cash payment.

C. HUBBARD, 13, Magdalen Street, Norwich, electrician and wireless dealer.—The public examination of this debtor was held recently. The statement of affairs showed gross liabilities of £514, of which £206 was expected to rank. Debtor attributed his failure to insufficient capital and delay in the payment of money due to him. His book debts totalled about £300. The examination was closed.

D. E. DAVIES, wireless engineer, Poulton Street, Kirkham.—This debtor, who had a deficiency of £163, appeared at Preston Bankruptcy Court on May 14th, for his public examination. He stated that he commenced in business two years ago with £5, and £45 borrowed from relatives. He had not made any profit from the concern. He attributed his failure to bad trade and illness. The examination was adjourned.

J. A. TREND, electrician, 31, Chapel Street, Luton.—First meeting held May 12th, at the Official Receiver's office, The Parade, Northampton. Trustee, Mr. T. Keens, 11, George Street West, Luton, appointed May 18th. Public examination June 17th, at the Court House, Luton.

A. NORTH & F. NORTH (A. & F. North), wireless and electrical engineers, 38, Bradford Road, and Market Place, Dewsbury. Trustee, Mr. F. Gomersall, 16, Bond Street, Dewsbury, appointed April 22nd.

J. V. WALLIS, wireless goods dealer, 46, King Street, Cambridge, late of 28, Regent Street, Cambridge. Trustee, Mr. J. L. Poland, Official Receiver, 5, Petty Cury, Cambridge, released April 28th.

E. O. HENSTOCK, electrical engineer, 21, Old Road, Brampton, Chesterfield.—First and final dividend of 1s. 10½d. in the £, payable at the Official Receiver's offices, 4, Castle Place, Nottingham.

C. H. PATRICK, electrical contractor, 132, Much Park Street, Coventry.—Receiving order made May 14th, on debtor's own petition. First meeting, May 31st, at the Official Receiver's office, 9-11, High Street, Coventry. Public examination, June 7th, at the County Hall, Coventry.

A. M. WILLMORE, electrical and radio engineer, 45, King Street, Brighton.—First meeting held May 27th, at the Official Receiver's offices, 12a, Marlborough Place, Brighton. Public examination, June 23rd, at the Court House, Brighton.

G. TURNER (Radio Supply Co.), electrician and wireless dealer, 34, Mesnes Street, Wigan.—First meeting, May 28th, at the Official Receiver's offices, 11, Dale Street, Liverpool. Public examination, June 24th, at the Court House, Wigan.

S. PURCELL, electrical contractor, The Arcade, Goole, Yorks.—First and final dividend of 1s. 10½d. in the £, payable at the Official Receiver's office, 21, King Street, Wakefield.

W. H. GREENALL (Hampton Electric Co.), electrician, Newerne Street, Lydney.—First meeting held May 26th, at 34, Market Place, Cardiff. Public examination, June 22nd, at the Town Hall, Newport, Mon.

J. H. PAINTER (Venables & Co.), electrician, 99, The Broadway, Cricklewood, N.W.—Last day for proofs for dividend May 28th. Trustee, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C.

J. N. DAVENPORT (separate estate), (lately carrying on business in co-partnership with L. A. Hackett, as Davenport, Hackett & Co.), electrical engineer and contractor, 36, Spring Gardens, Manchester, late of Albert Mills, Albert Street, Manchester.—Last day for proofs for dividend, May 18th. Trustee, Mr. A. Grierson, 21, Spring Gardens, Manchester.

L. A. HACKETT (separate estate).—Last day for proofs for dividend, May 18th. Trustee, Mr. A. Grierson, 21, Spring Gardens, Manchester. First and final dividend of 20s. in the £, payable June 4th at the Trustee's offices.

J. A. BOSHER, electrical engineer and contractor, 33, High Street, Aberdare.—Last day for proofs for dividend, June 1st. Trustee, Mr. S. E. Clutterbuck, 31, Queen Street, Cardiff.

T. ROBERTS and J. TAYLOR (Roberts & Co.), electrical engineers, late of 61, Old Town Street, Plymouth, and at Fore Street, East Looe.—Last day for proofs for dividend, June 2nd. Trustee, Mr. F. West, 2, Courtenay Street, Plymouth.

M. D. ROSENBLOOM (D. Rose & Co.), electrical engineer, 25, Osborn Street, E.1.—Bankrupt's discharge suspended for three years, until April 30th, 1929.

W. C. RHODES (L. J. Palmer & Co.), electrical engineer and contractor, 141, Newspaper House, Corporation Street, Birmingham.—Discharge granted subject to bankrupt's consenting to judgment being entered against him for £50 (£50 paid in lieu of entering up judgment). Supplemental dividend of 4¼d. in the £ payable at the Official Receiver's office, 191, Corporation Street, Birmingham.

T. BARTON, electrical engineer, Electric Works, Ainsworth Street, Blackburn.—Immediate discharge granted.

C. J. NICHOLS (C. J. Nichols & Co.), electrical engineer, 7, Park Street, Bridgend.—Trustee, Mr. C. T. Appleby, 26, Corporation Street, Birmingham, appointed May 14th.

F. V. LAMBERT (Lambert & Curley), electrical contractor, 27, Parrock Street, Gravesend.—Trustee, Mr. W. A. J. Osborne, 119, Finsbury Pavement, E.C., appointed May 17th.

F. H. ARMITAGE, electrical engineer, 9, Occupation Lane, Pudsey.—Last day for proofs for dividend, June 8th. Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford.

R. HAWORTH, electrical engineer, 154, Duckworth Street, Darwen, Lancs.—First and final dividend of 8¾d. in the £, payable at the Official Receiver's offices, 11, Winckley Square, Preston.

J. HUMPHREYS, plumber and electrical engineer, the Yard, behind the Plough Inn, Oldham, and 22, Buxton Crescent, Rochdale.—First and final dividend of 4½d. in the £, payable at the Official Receiver's office, Byrom Street, Manchester.

Company Liquidations.—SCAMMELL & ABBOTT, LTD., Birmingham, electrical and accessories dealers.—A meeting of creditors was held recently, when a statement of affairs was submitted which disclosed liabilities of £1,572, all due to unsecured creditors. The net assets amounted to £276, leaving a deficiency of £1,296. It was reported that Messrs. Scammell and Roberts commenced business in February, 1919, with £200 capital. They were successful at the outset, and in 1922 borrowed £300 for the purpose of extending their business. In April, 1923, the company was formed, and later larger premises were taken. In June, 1925, in consequence of the slump, reduced turnover, &c., the manufacturing side of the business was closed. The wireless trade proved less profitable, and matters went from bad to worse. In March last, Mr. Scammell advanced a sum of £200 to pay the bank, and he was given a debenture for that amount. The liquidator stated that after consulting some of the principal creditors he had disposed of the business, other than the book-debts, for £400. The meeting was adjourned.

GOODCHILD & PARTNERS, LTD., dealers in wireless components, &c., 56-58, Eagle Street, Southampton Row, W.C.—The statutory first meetings of the creditors and shareholders of this company (in compulsory liquidation) were held last week at Carey Street. The winding-up order was made on March 30th upon the petition of a creditor. The Official Receiver reported that the company was incorporated in April, 1919, for the purpose of acquiring a business of engineers' factor which had been conducted by G. W. P. Goodchild, under the style of Geo. W. Goodchild & Partners. In 1920 a subsidiary company was formed for the purpose of selling certain lamps, and in 1924 the activities of this company were directed to the sale of radio valves and components. In February, 1925, the business was transferred to the company, which Goodchild anticipated would transact a large volume of business, but this failed to materialise. In February last a receiver was appointed on behalf of the debenture holder, and the former had since realised nearly all the assets, but he did not expect them to produce enough to cover the amount due Goodchild had attributed the company's failure to its being induced by a "boom" to extend its activities in the provinces, to the flooding of the market with surplus Government stores, to the slump in wireless goods which had set in, and to other causes. The accounts showed total liabilities of £7,159 (unsecured £5,429), and assets valued at £1,729; the latter would be absorbed by the preferential and debenture holders' claims, whilst the account with the contributories disclosed a deficiency estimated at £23,030. In the absence of any resolution the Official Receiver remained in charge of the liquidation.

Kenmac Radio, Ltd., Dalling Road, Hammersmith, radio manufacturers. A meeting of creditors was held on May 20th, at the offices of Messrs. S. E. Denning, 20, Bedford Row, W.C.1, when a statement of affairs was presented which showed total liabilities of £4,348 and total assets of £927, leaving a deficiency of £3,421. The liquidator reported that the company was formed in October, 1924, with a nominal capital of £100, of which only £3 was issued and paid up. The company was formed for the purpose of exploiting a small crystal set in the form of a book. The inventor was Capt. Mackie, and he was a director of the company. In April, 1925, a small factory was taken at Hammersmith. The company had incurred a gross loss of £1,000 and a net loss of £2,200.

Mr. Baker (Wholesale Traders' Association) said that the company was formed with £3 capital, and he considered that instead of Mr. Petrie advancing money from time to time (totalling £3,480) to carry on the business, he should have put up the money in shares. It was decided that Mr. Petrie should offer the creditors 10s. in the £. It was eventually resolved that subject to Mr. Petrie's postponing his claim until the creditors had received 10s. in the £, the voluntary liquidation should be continued, it being agreed that any funds available after Mr. Petrie had also received 10s. in the £ should be distributed *pro rata* amongst the creditors. A committee of inspection was appointed, consisting of Mr. Head, representing the Marconiphone Co.; Mr. E. H. Hawkins, representing creditors; and Mr. Salaman, of the Carrington Manufacturing Co. The following are creditors :—

	£		£
Marconiphone Co., Ltd. ...	... 100	Denning, S. E., & Co. ...	... 21
Howard Wall & Co. ...	... 367	Chamberlain, E. W. ...	... 24

British Wireless Supply Co. (1924), Ltd.—Meetings of creditors and contributories, June 7th, at the Official Receiver's office, 24, Lower Bond Street, Leeds.

Radio Equipment Co., Ltd.—Liquidator (with a Committee of Inspection), Mr. R. J. Tayler, Coventry House, South Place, Moorgate, E.C., appointed May 1st.

Nelson Electrical Co., Ltd.—A petition for the winding up of this company has been presented to the High Court by E. Durand, trading as C. Melin & Co. and E. Durand & Co., of 7, India Street, Crutched Friars, E.C., and will be heard in London on June 1st.

Burwood (Concessionaires), Ltd.—Particulars of claims to the Liquidator, Mr. G. E. McCanlis, 9-15, Oxford Street, W.1, by June 30th.

Radio Phonopore & Electricals, Ltd.—A petition for the winding up of this company has been to the High Court by Mr. C. W. Slingo, engineer, of 39, Loveday Road, West Ealing, creditor, and will be heard in London on June 1st.

C.A.C. (Radio), Ltd.—A meeting of creditors was called for May 21st at Winchester House, Old Broad Street, E.C. Particulars of claims to the liquidator, Mr. E. W. Sudlow, 358, Cranbrook Road, Ilford, by June 25th.

H. E. Davis, Ltd.—Winding up order made by the High Court on May 11th.

Reflex Radio Co., Ltd.—Winding up order made by the High Court on May 11th.

British Wireless Supply Co., Ltd.—Winding up order made by the County Court of Yorkshire held at Leeds on May 4th.

Dissolutions of Partnership.—Electrical Services, electrical engineers, Sudbury, Suffolk.—Mr. P. J. Gates and Mr. S. Downs have dissolved partnership.

Electrical Installation Co., electrical engineers, 25, St. Mary's Row, Moseley, Birmingham.—Mr. E. Cooper and Mr. T. Yarnit have dissolved partnership.

Private Arrangements.—J. L. Smith and H. G. Smith, trading as J. L. Smith & Co., electrical and radio engineers and contractors, 45, Queen's Road, Peckham, S.E.15.—A meeting of creditors was held on May 13th, at the offices of Messrs. Harper Stringer & Co., Queen Street, E.C., when a statement of affairs was presented, which disclosed liabilities of £431, and a surplus of £30. Mr. Stringer reported that Mr. J. L. Smith had been in business for a number of years and he was joined by Mr. H. G. Smith, who was no relation, in 1924, and he introduced about £300 capital. The present position was attributed to declining business. No offer was made, and the creditors decided that the debtors should execute a deed of assignment in favour of Mr. Stringer as trustee, with a view to the sale of the business as a going concern. It was the trustee's opinion that the creditors would receive 20s. in the £. The following are creditors :—

	£		£
Kye, Ltd.	... 33	Hammond & Smaldon ...	... 23
White, B. E.	... 46	Robinson, A. S., & Co. ...	... 21

C.A.C. Radio, Ltd., 10, Rangoon Street, Crutched Friars, E.C.3, and at Bournemouth and Leeds.—At a recent meeting of creditors Mr. E. W. Ludlow read a scheme prepared by the committee of inspection. Mr. H. Burford Judge intimated that it was not acceptable to the cash creditors unless the bank was accorded a certain amount of preference. The creditors present unanimously refused to accept the scheme with this reservation. Mr. G. Powell Stevens (British Industrial Exhibitions, Ltd.) proposed, and Mr. Roberts (Messrs. Thomas March, Ltd.), seconded, a proposal that in the event of the company's passing into voluntary liquidation the trade creditors should recommend that their nominee, Mr. E. W. Ludlow, be appointed liquidator.

D. H. Robertson, trading as Electrical Agencies, 1, Chapel Hill, Clevedon, electrical contractor.—A meeting of creditors was held recently, at the offices of Messrs. E. T. Collins and Son, Bristol, when a statement of affairs was presented which showed liabilities of £274. The net assets were estimated at £126, leaving a deficiency of £148. The debtor commenced trading, without capital, in January, 1923. He was later joined by a partner, who brought in £50, but the partnership was dissolved in three months, the debtor repaying the £50. The present position was attributed to lack of capital and loss on trading. There was no offer of a composition, and it was decided to confirm the deed of assignment which had already been executed to Mr. Arthur Collins to protect the estate. A committee was also nominated, consisting of the representatives of the Sloan Electrical Co., Ltd., the General Electric Co., Ltd., and J. H. Lewarn & Son.

The principal creditors are :—

	£		£
Baxter, T.	... 30	Sloan Electrical Co., Ltd.	... 50

Illumination Design Course for Contractors and Wholesalers.—Another of the excellent illumination design courses arranged by the E.L.M.A. Lighting Service Bureau is to be held at the Bureau in Savoy Street, W.C.2. This time it is for electrical contractors and wholesalers, who will assemble on Monday, May 31st, for a four-days' course, comprising morning and afternoon sittings from day to day until Thursday afternoon, June 3rd. The subjects of the lectures and demonstrations will be :—The Magnitude of the Lighting Business; Lighting Fundamentals and Principles of Distribution; a Practical Lighting Demonstration; Economics of Light Production; Simplified Methods of Designing Illumination Schemes; Light and Industry; Planning a Factory Lighting Scheme; Electric Lamp Manufacture; Contracts and Sales Rules for E.L.M.A. Lamps; the Possibilities of Colour Lighting; Solving Special Lighting Problems; Standardisation of Lamps and Lighting Equipment; the Lighting of Offices; Floodlighting and its Possibilities; Analysing the Lighting Market; the Lighting of the Home; Display Window Lighting; Efficient Lighting for Shops and Stores; Advertising Lamps and Light; Electrical Advertising; and Selling Better Lighting. The proceedings will close with an informal dinner at Carr's Restaurant, Strand, at 6.30 p.m., on Thursday, June 3rd. There will be accommodation for 80 visitors at the Bureau, and we are confident, taking into account the justifiable popularity of these courses, and the excellence of the arrangements made by the E.L.M.A. staff for the convenience and accommodation of those attending them, that this number will be reached. It is therefore important that applications should be lodged at once.

Safety Lamps in Mines.—The Secretary for Mines has made an Order, under Section 33 of the Coal Mines Act, 1911, approving for use in all mines to which the Act applies, subject to the conditions specified in the schedule to the order, the following types of electric safety lamps :—

Pearson "Ni + Fe" (square).
Pearson "Ni + Fe" (5-volt).
Edison Cap.
Patterson Cap Type J1 and K1.
Wolf Cap.
Worsnop's "Maxilux."
Pearson "Ni + Fe" Officials' Pocket.

For Sale.—Messrs. Veryard & Yates will sell by auction at an early date, at the Y.M.C.A. Huts, Waterloo Road, S.E., large quantities of wireless, electrical and general stores, &c. Mr. E. Fryett will sell by auction on June 3rd, at the London Trade Sale Rooms, 78 and 81, Fetter Lane, a quantity of telephone wire and cable. The Manchester Electricity Committee has for disposal 36 field rheostats, 220 and 520 V. (See our advertisement pages to-day.)

German Enterprise in Turkey.—According to a German correspondent at Constantinople, the establishment of small central stations in Turkey is making progress as a result of the activity of the German firms of Siemens, the A.E.G., and Bergmann. Quite recently the Turkish Electrical and Radio Co. has been formed with the participation of the firm of Siemens, and a prominent share in it has been taken by the Isch Bankassi (Bank of Commerce), which is directly supported by the Government. The foundation stone of the new works to be erected by the company was recently laid at Eski-Shekhir, which is an important railway base, where the central repair shops are situated. In the first place, the new works is intended to produce electrical apparatus and accessories so as to be able to emancipate the country from dependence upon others for these requirements.

Electricity and Gas at Leeds.—The Corporation Electricity Committee proposes to erect an all-electric bungalow, for demonstration purposes, on a vacant site at the junction of Calverley Street and Portland Crescent; and the Gas Department is to erect on the same site an all-gas bungalow, also for public demonstration purposes.

Standard Accumulator Components.—In connection with its provisional standards for battery crates, moulded accumulator containers, terminal posts and cable connectors, the Standards Department of the Society of Motor Manufacturers and Traders has issued a list of nineteen firms which are manufacturing and supplying battery components in accordance with the standards.

Lead.—Reporting on May 22nd, Messrs. James Forster and Co. stated that the position had undergone little change since their last report, the interference with consumption in this country by the strike being offset by a better demand from the Continent. "Supplies are as plentiful as ever and now that consumption is being held up by a threatened shortage of fuel, the position is not likely to get any better, but rather the reverse. The market, on the other hand, contrary to general expectation, has quite a firm undertone which can only be ascribed to sentimental reasons as a result of the settlement of the general strike. With a return to normal conditions the position of lead would seem to be quite sound and there would be no reason to anticipate prices going much lower."

Our Foreign Trade.—The following were the values of imports and exports of electrical goods and machinery during April, 1926:—

	April, 1926.	Inc. or dec.	4 months, 1926.
	£	£	£
Imports—			
Electrical goods and apparatus	289,606	−66,251	−283,575
Machinery	1,250,729	+227,451	+479,134
(Electrical machinery) ...	111,404	+13,306	+2,922
Exports—		...	
Electrical goods and apparatus	786,252	−315,568	−477,098
Machinery	3,594,732	−241,542	−331,042

Russian Electrical Progress.—A report presented to the Presidium of the Supreme Economic Council says that none of the existing regional electric power stations worked by steam is large enough to meet the demands for power, although the capacity of the stations for the general supply of power is twice as large as in 1917. Out of seven power stations built according to the programme of the State Commission for the electrification of Russia, five stations with a power at the beginning of the year 1925-26 of 90,000 kW, have been extended during this year to produce nearly three times as much (266,000 kW) and further extensions are already planned. The Shterovski station will begin to work in the autumn, and its capacity is to be more than doubled during the next few years. As soon as the Volkhov station is finished in the autumn the question will arise of installing another hydro-electric station for the Leningrad district. This shows that in the great industrial centres the growth of the demand for electrical power considerably exceeds the pace of electrical construction. Altogether in 1925-26 nine stations will begin production with a capacity of 183,500 kW, and eleven stations are to be equipped to produce 271,000 kW, out of which four, with a capacity of 90,000 kW, are new stations. The Supreme Economic Council has requested the Glavelektro to prepare a report on the plans for the development during the next five years of the electrification of the country.—*Reuter's Trade Service* (Moscow).

Rewards for Strike Service.—The Westminster Electric Supply Corporation, Ltd., has given gratuities to members of its power station staff who remained at duty during the strike.

The Wireless Retailers' Association.—The annual general meeting of the Wireless Retailers' Association of Great Britain, at which the president, Sir Charles Bright, was present, was held on April 28th. The chairman of the Executive Council, Mr. F. S. Horsey, in the course of an address, said that progress had continued, and the position of the Association had been improved and strengthened in every way. The trade discounts allowed by manufacturers generally had greatly improved during the last two years, and they were now substantially adequate in most cases. The efforts of the Association had contributed materially to that result. In an endeavour to raise the status of dealers, it was decided some eighteen months ago to issue a certificate to members. One of the objects was that it should be a guarantee to the public of reliability and efficiency. The conditions enforced were solely in the interests of members themselves, and were based on those existing in the best organisations. A handbook had been issued containing particulars of the aims, objects and activities of the Association, to retailers generally. Mr. Horsey referred to the formation of the Society of Radio Manufacturers, which had realised the need for dealing adequately with retailers in the matter of discounts, and considered that each section of the industry must have its own representative association. In conclusion, Mr. Horsey said that there were strong indications that under the new order of things which was developing, manufacturers and retailers as independent bodies would co-operate for the common good. By that means the trade might be made an honoured and a lucrative one.

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report May 25th:—Copper (electrolytic) bars, £64 15s., 5s. decrease; do. do. sheets, no change; do. do. wire rods, £74 15s., 5s. decrease; do., do. h.c. wire, 9¾d., ¼d. decrease.

Messrs. James & Shakespeare report May 25th:—Copper bars (best selected), sheet and rod, no change; English pig lead, £30, 5s. decrease.

Messrs. Edward Till & Co. report May 25th:—India-rubber, Para, fine, 1s. 8¾d., 1¼d. decrease.

Book Notice.—"The Annual Report and Accounts of the Electrical Trades Benevolent Institution for 1925." London: The Offices of the Institution, 98, Grosvenor Road, S.W.1.

Lighting and Power Notes.

Argentina.—ELECTRICAL DEVELOPMENT.—In its report for 1925, the Cia. Italo-Argentina de Electricidad states that during the current year two 25,000/30,000-kVA turbo-generators are to be installed and put into commission, increasing the capacity of its Pedro Mendoza power station to 100,000 kVA. Additional converting plant is to be installed at various sub-stations, which will raise the total capacity of these stations to 38,300 kW.

The report of the Compania Hispano Americana de Electricidad (Chade) shows that during the past twelve months the number of consumers advanced by 21,692 to a total of 206,320, representing a load of 574,449 kW. The output of the various power stations of the company totalled 496,698,392 kWh in 1925, an increase of 10.77 per cent. as compared with 1924. Work is well in hand on the extensions at the principal power station, where the fourth and fifth 25,000-kW steam turbo-generators are in course of erection. The sixth and seventh sets of similar capacity are about to be shipped from Europe and are expected to be ready for operation by the next Argentine winter. Twelve new boilers have lately been put in service and twelve more have been ordered. The company has commenced the construction of a new power station, the ultimate capacity of which will be 600,000 kW. Two 52,500-kW turbo-alternators have been ordered for this station as well as eight boilers to be adapted for pulverised fuel firing. The total length of the company's distributing mains now amounts to 4,354 miles.

Ashford (Kent).—ELECTRICITY AGREEMENT.—The Urban District Council has adopted an agreement for a supply of electricity to the premises of the Southern Railway Co.

Beckenham.—MAINS EXTENSIONS.—The Electricity Committee is to extend its mains to housing estates at a cost of £3,500.

LOAN SANCTIONED.—The Urban District Council has received sanction to the borrowing of £26,000 for h.p. feeder mains.

Birkenhead.—ELECTRICITY SUPPLY TO WIRRAL.—The Finance Committee of the Corporation has under consideration a recommendation of the Electricity Committee to give a supply of electricity to the Wirral Rural District Council on terms similar to those made in the out-townships of the Corporation's present area of supply. A special meeting of the Town Council may be called to consider the matter.

LOANS.—The Electricity Committee is applying for sanction to loans of £30,500 for mains and £10,500 for h.p. feeders. Sanction has been received to a loan of £5,500 for transformers and switchgear.

Budleigh Salterton.—STREET LIGHTING.—The Urban District Council has decided to invite tenders for lighting the town from the local gas and electricity companies.

Calne.—INAUGURATION OF SUPPLY.—An electricity supply for the town was formally inaugurated on April 23rd. Electricity is obtained at 220 V d.c. from Messrs. C. & T. Harris (Calne), Ltd., and supplied to consumers at 10d. per kWh for lighting and 6d. per kWh for power.

Clayton.—INQUIRY POSTPONED.—The Electricity Commissioners recently informed the parties concerned that the inquiry fixed for May 19th in Bradford to hear applications from Clayton, Bradford, and the Electrical Distribution of Yorkshire, Ltd., for an Order to distribute electricity in Clayton was postponed. This has been necessitated by the dislocation of the Commissioners' arrangements consequent on the general strike.

Continental.—ITALY.—Work is shortly to be commenced by the Società Edison, of Milan, on the establishment of a steam-operated power station at the port of Genoa. The plant will have a capacity of 100,000 kW and will be provided with boilers adapted to use pulverised coal as fuel.

LUXEMBURG.—The A.E.G., of Berlin, in conjunction with the Rhenish-Westphalian Electricity Supply Co., has drawn up a scheme to provide the Grand Duchy of Luxemburg with a greatly increased electricity supply by utilising, by means of two dams, the water power of the River Our, which forms the frontier between the Grand Duchy and Germany. It is proposed to form two large lakes, one of which would have a capacity of 176,076 million gallons, and the other a capacity of approximately 1,100 million gallons. It is estimated that the scheme would cost about five millions sterling.

SWITZERLAND.—According to a report lately issued by the Swiss Water Economy Department, the total available water power of the country is equal to 4 million h.p. for an average of 15 hours per day. Of this only one million h.p. is so far being utilised. At the beginning of the present year work was in hand on the establishment of several new hydro-electric stations, among them being the Ober-Ems, with a capacity of 11,000 h.p., the Vernayaz (108,000 h.p.), the Handeck—the first of three on the Upper Hasli—(100,000 h.p.), and the third extension of the station on the Lungern Lake which will increase its capacity from 20,000 to 22,000 h.p.

Croydon.—LOAN.—The Electricity Committee has recommended that sanction be obtained to the borrowing of £60,000 for mains extensions.

DOMESTIC APPARATUS.—The Committee is voting £5,000 for the purchase of domestic apparatus to be let out on hire. The total expenditure for this purpose amounts to £15,312.

Eastry.—ELECTRICITY SUPPLY.—Messrs. Pearson & Dorman Long, Ltd., have informed the Rural District Council that they are arranging for the laying of an underground cable along the

Nonington Woollage Roads, and the cable will be sufficient to allow for public lighting in addition to supplying electricity for houses.

Epsom.—New Plant.—The Urban District Council has received formal consent to the installation of two Diesel engines, together with the necessary auxiliary plant. The electrical engineer has submitted a revised estimate for the erection of the new plant in an extension of the existing engine room at an estimated cost of £14,500.

Hazel Grove and Bramhall.—Loans.—The Urban District Council has applied for sanction to loans of £2,200 for mains and services for Woodford, and for £1,500 for the general purposes of the undertaking.

India.—Madras Hydro-Electric Project.—The Governor of Madras recently laid the foundation of the important Pykara-Moyar hydro-electric project which is to utilise a fall of 3,088 ft. where the River Pykara descends from the Nilgiri plateau into the plain near the Mysore border, 14 miles from Ootacamund. The proposed dam, 164 ft. high, will impound 3,826 million cubic feet, with a water-spread of 2½ square miles. Owing to the absence of a suitable saddle for the discharge of surplus water, the dam will be of the pierced type, discharging surplus as well as the normal discharge for the development of power through sluices in the body of the dam. The supply required for the generation of power will be picked up from the river by a low masonry weir, three miles below the dam, and conveyed through a head sluice and a flume channel 5,220 ft. long to the forebay, which will be formed by closing the ends of a natural depression by two earthen bunds. The surplus flood discharge of the river will pass over the falls as at present. The main transmission line will be carried up the hill and *via* Ootacamund, Wellington, and the valley down which the road and railway to Mettupalayam pass, to Mettupalayam, whence one main transmission line will proceed to Madras and another to Dindigul. The scheme will supply power in bulk to the Municipalities of Ootacamund and Coonoor, the Wellington Cantonment, the Cordite Factory at Aruvankadu, Coimbatore, Madras, Trichinopoly, Dindigul and Madura, and to the South Indian Railway for electrification between Madras and Villupuram and between Trichinopoly and Madras. This route is flat and easy throughout, and the distance from the power station to Madras is 296 miles.

Moyar Scheme.—The subsidiary scheme, known as the Moyar project, which will feed additional power into the Pykara mains, is designed to utilise a second time the water which passes through the turbines at the Pykara power house. This water will be conveyed by a channel 6,800 ft. long to the Avaraihalla river, picked up again nearly five miles lower down and passed through a small forebay and valve tower down a second pressure pipe 2,000 ft. long to a power house on the banks of the Moyar River, with a fall of 1,050 ft. The turbines at this station will develop an additional 18,000 b.h.p. and the generators will deliver an additional 34.6 million kilowatt-hours. Thus the whole scheme will provide 66,480 e.h.p. at full load and about 150 million kWh per annum. The power from the Moyar station will be transmitted 8½ miles to the Pykara power station, where it will be fed direct into the Pykara main transmission line at 132,000 volts. This supplementary scheme will utilise the same storage works and transmission line as the Pykara power station. The Moyar scheme alone is estimated to cost only Rs.16,45,000, but the total cost of the combined Pykara-Moyar schemes, including indirect charges, is estimated at Rs.2,73,60,000. The complete scheme has not yet been formally sanctioned by the Government or the Secretary of State for India, but it is hoped that sanction will not be long delayed.

Irish Free State.—Blackrock (Dublin).—At a recent meeting of the Urban District Council the report of the Electric Light Committee was adopted, granting a lease of 42 years to the Kingstown Urban District Council for the supply of electricity for lighting, provided that at least 50 per cent. of the labour required for the maintenance of the supply be drawn from Blackrock.

Maidenhead.—Objection to Scheme.—The Rural District Council has decided to raise an objection to the application of the Cookham and District Electricity Corporation to erect overhead lines in the Cookham Dean district.

Northern Ireland.—Lurgan.—The Ministry of Finance of Northern Ireland has sanctioned a loan of £11,305 applied for by the Urban District Council for the purpose of carrying out an electricity scheme for the town. It is reported that the scheme will be in operation by next October.

Lisburn (Co. Antrim).—The Urban District Council has decided to ask a Special Committee to report on a proposal to purchase electricity in bulk from the Belfast Corporation and distribute it by overhead and underground cables.

Poulton-le-Fylde.—Electricity Supply.—The Urban District Council has consented to an application by Blackpool Corporation for authority to supply electricity in its area.

Price Reductions. — Reductions in the charges for electricity have been made or recommended in the following districts:—

Barnsley.—Residential two-rate tariff "unit" charge from 1d. to ¾d.; weekly charge in the Council houses from 1s. per week to 9d. per week, and electricity consumed from 1d. to ¾d. per kWh.

Slaithwaite.—Lighting, flat rate: From 7d. to 6d. per kWh. Domestic rate for private houses, 15s. per room per annum, plus 1d. per kWh instead of 2d.

Doncaster.—General lighting, from 5½d. to 4½d. per kWh during the summer quarters, but to remain at 5½d. in the winter quarters, with a rebate of 1d. per kWh for the equivalent number of kWh used during the two summer quarters. Signs and shop-window displays: From 2¾d. to 2d. per kWh. Prepayment meters: From 6½d. to 5½d. per kWh. Domestic supplies: The fixed charge of 15 per cent. on the net rateable value of the premises, plus ¾d. per kWh in the summer quarters, and 1d. per kWh in the winter quarters, reduced to 12½ per cent. on the net rateable value, with a minimum annual payment of £1 15s., plus the existing charges for electricity used.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation the following Special Orders made by them:—The Urban District Council of Llantarnam for the supply of electricity in the district; the Derbyshire and Nottinghamshire Electric Power Co., for the supply of electricity in part of the rural district of Shardlow; the Bingley Urban District Council to supply in part of the township of East and West Morton.

The Scarborough Corporation has applied for a Special Order authorising it to supply electricity in the borough and rural district of Scarborough and in the urban districts of Scalby and Filey.

Sunderland.—Electricity Supply.—The Sunderland Corporation has agreed to supply electricity through pre-payment meters in certain instances to houses of three to six rooms, at a charge of 6d. per kWh, being 3½d. per kWh for electricity and 2½d. per kWh for the hire and maintenance of the installation. A 325-kVA static transformer with switchgear is to be installed at the Whickham Street sub-station, at an estimated cost of £753.

Swansea.—Electricity in Bulk.—The Electricity Committee has decided to provide a bulk supply of electricity to the Cwyllynfell and New Brock collieries, Amman Valley, at a cost of £16,000.

Mains Extensions.—The Committee is to carry out mains extensions at a cost of £2,000.

Syria.—Electrical Development.—A message from Beyrouth states that in accordance with a decree of the Governor of Great Lebanon, the Société des Forces de la Khadiehach has begun the construction of a hydro-electric power station which will have an initial capacity of 1,500 h.p., and which can be brought up to 3,000 h.p. by using another waterfall. The new station is to supply electricity to Tripoli, Charre, Masroum and Edho. The company intends shortly to erect a similar station for the town of Zahle.—*Reuter's Trade Service* (Paris).

Torquay.—Electricity in Bulk.—The electrical engineer has furnished a special report to the Town Council with regard to the proposal to provide a bulk supply of electricity to the Brixham Gas & Electricity Co., including the charges at which the supply could be given for distribution in Brixham and Churston Ferrers. The report has been submitted to the company for consideration.

United States.—St. Lawrence Development.—The New York correspondent of *The Times* reports that the New York State Power Commission is expected shortly to grant licences for a huge project for the development of the water power of the St. Lawrence to the Frontier Corporation, owned by the America Aluminium Company, Dupont De Nemours and Co., and the General Electric Company. The Frontier Corporation has proposed that the development should be undertaken by the United States alone or jointly with the Ontario Government. The Commission is understood to be in favour of the former plan which comprises two schemes, the first at Cat Island, where Lake Ontario enters the St. Lawrence, and the second at the foot of the big Saulte Rapids.

Weymouth.—New Plant.—The Electricity Committee has received consent to the extension of the generating station by the installation of one 1,500-kW, 3-phase, 50-cycle turbo-alternator, two 20,000-lb. boilers and auxiliary plant.

Loan.—The Committee has recommended that application be made for sanction to a loan of £3,000 for the purchase of electric cookers.

Workington.—Extension of Supply.—The Town Council has offered a supply of electricity to the Seaton district at 7d. per kWh for private lighting, 3d. per kWh for power, and for public lighting at £4 per lamp per annum. As an alternative the Council offers a bulk supply at the borough boundary at a charge of 2d. per kWh with a minimum of 20,000 kWh per annum.

Tramway and Railway Notes.

Japan.—Electric Railways.—An electric railway company is in course of formation with a capital of 5,000,000 yen. The company will be named the Fuji-sanroku Denki Tetsudo K.K., its object being to construct an electric railway to a national park to be laid out at the foot of Mount Fuji. The company will be granted 7 per cent. subsidiary interest by the Government under the Local Railway Subsidy Law.

The directors of the Tobu Railway Co. have recently decided to increase the capital of the company from 24,500,000 yen to 50,000,000 yen, in order to finance the extension and electrification of its lines.

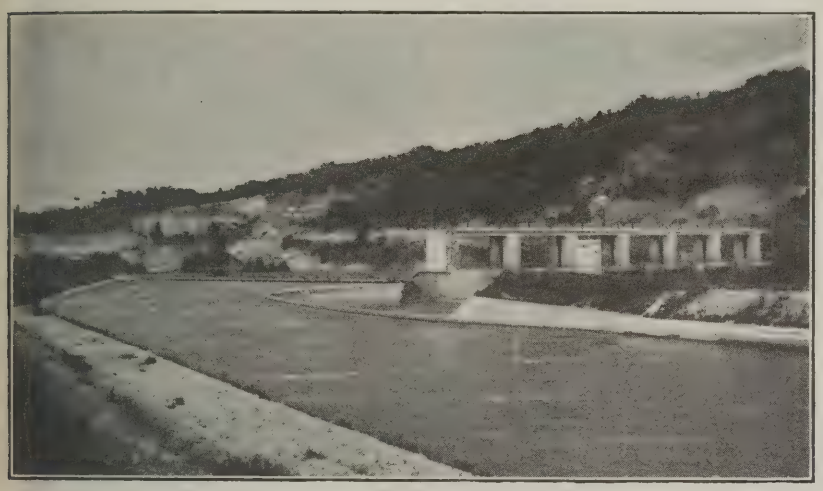
(*Continued on page 799*)

Hydroelectric Power on the Lower Isère.

The First Transmission in France at 120,000 Volts.

By T. RICH.

In the South-East of France near the headwaters of the Loire lies the industrial district of St. Etienne; although comparatively close to the Rhone Valley it is separated therefrom by a rugged ridge of hills. This district is not well known to English people as, in a way, it lies off the beaten track; but, owing to a large extent to the existence of collieries, it has been for a number of years an important centre of industry, especially for the manufacture of arms, cycles, tools, and special kinds of steel. The war, with the temporary destruction of the northern industrial area and the danger to Paris industries through bombing, led to a great development of manufacture in the south, and this has created a demand for power from various quarters, especially in this district.



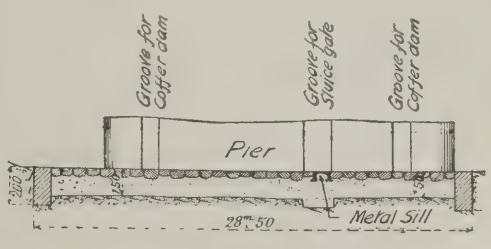


Fig. 1.—The Barrage on the Lower Isere.

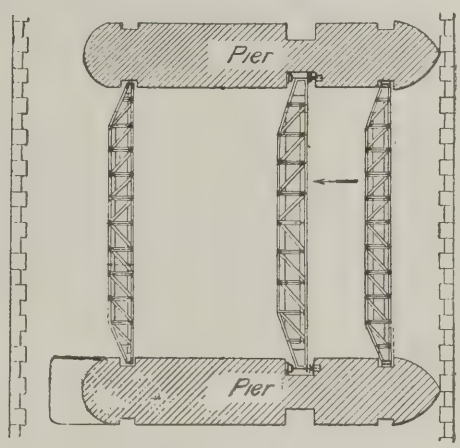

Fig. 2.—One Pass of Dam, showing Gate and Coffer-dams

The watershed of the Isère has been for the last forty years perhaps the most important centre of French water-power development; until recently practically all the power has been developed in the district, which stretches from the Alpine region, bordering on the Italian Frontier, to the watersheds of the tributaries the Drac and the Romanche, whose waters flow into the Isère near Grenoble, which town lies at an altitude of 700 ft.

The development of the water power and navigation of the lower section of the Rhone Valley has been studied for some time; of the former, the power station at Beaumont-Monteux, on the Lower Isère, 4½ miles from its junction with the Rhone, near Valence, is a good beginning; and of the latter the canal tunnel into Marseilles Harbour, which is over 70 ft. wide, to take 1,400-ton barges into a lagoon connected by canal with the Rhone, is an important step, besides being a very fine bit of engineering work.

The problem of the utilisation of a rapidly-running river, liable to very heavy floods after the melting of the upland snow and to a comparatively small flow of water at some seasons of the year, is not so easy as it looks. The site of the Lower Isère power station was chosen where good deep-river banks were available, so that the backing up of the water to the extent of 4.6 miles, due to the erection of a barrage across the main stream, would not give rise to the flooding of valuable lands. In view of the extraordinary floods to which this snow-fed river is subjected, instead of placing the power house on the barrage itself, as is often done, it is placed at the end of an artificial cut formed into a by-pass. The main river is closed at times of low water by means of adjustable sluices, which in time of flood can let pass along the main stream all the water not required for the purposes of power generation.

A barrage, fig. 1, 440 ft. long, is placed across the river; it has six openings, each 17.5 metres (57.4 ft.) wide, arranged to hold up 10 metres (33 ft.) of water.

C, cables to and from switch-gear; G, grill; H, by-pass for rubbish caught by grill; I, switch-gear; P, control board; V, sluice gates; R, motor for sluice gates.

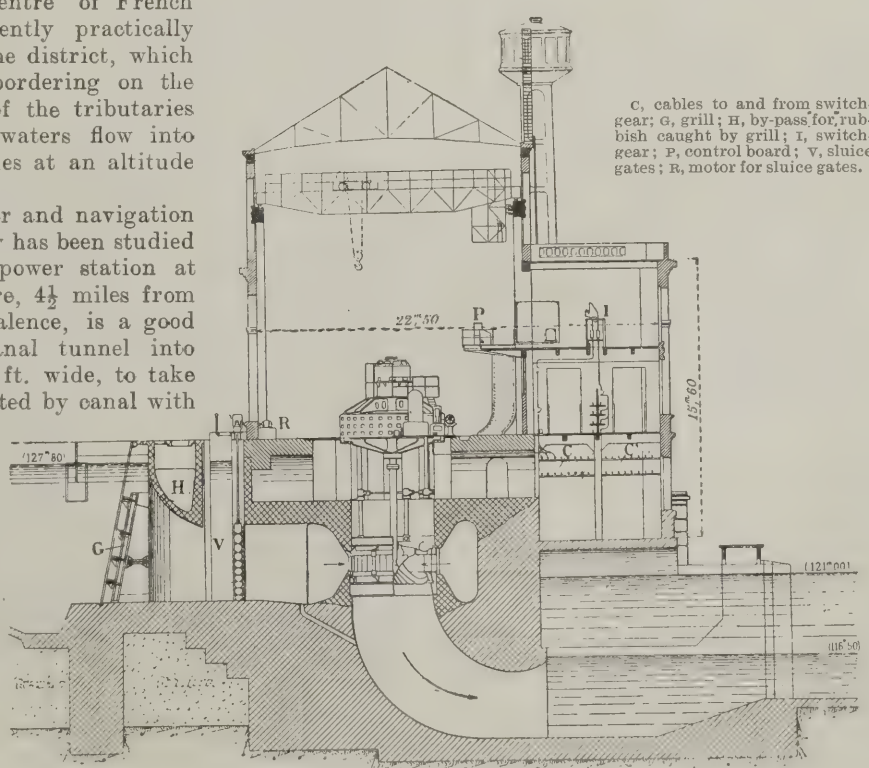

Fig. 3.—Section of Power Station.

The low-water flow is 90 cubic metres (117.7 cu. yd.) per second. At flood time in spring the flow reaches 1,500 cu. metres per sec. By lowering the water level to the extent of one metre a peak load covered by 11,000 kWh can be dealt with.

The foundations of the piers of the barrage are built on a raft made with "ciment fondu" armoured with rails covered with a stone pitching. The piers are 23 metres long and 4.2 m. thick; they are joined by three armoured-concrete ties, which form passage ways. The walls of the piers were built up of pre-cast concrete blocks made with a rich mixture, .50 × .28 × .22 metres, as headers and stretchers, filled in with ordinary concrete, and grouted afterwards under pressure to secure a perfect union: this method of procedure allowed the work to take place with great rapidity during the time when the river conditions were favourable.

Fig. 4.—Downstream Side of Power House.

The sluice gates, fig 2, are of the "Storey" type; their total height is 10 metres and width 18.77 m. overall; at the top of each sluice a section 1 metre deep is arranged on a pivot so that a certain quantity of water can be allowed to flow over the top. The sluice rests on a cast-iron sill embedded in the concrete; the gates are not balanced, and they are lifted by means of chains and winches operated by motor-driven shafts. They are fitted with emergency hand drive. The motor of each sluice is of the 3-phase type, 38 h.p., 570 revs., 220 volts; it is arranged with an automatic brake, and an automatic cut-off which cuts out when the gate reaches the top of the travel; the controller is of the tramway type. The movable flap at the top of each sluice gate is operated by means of wire ropes and drums through a horizontal shaft with reducing gear connected to a 5.5-h.p. motor, 930 revs., 220 V. Each sluice gate weighs about 150 tons; it can be raised at the rate of about 6 in. a minute. Each pier of the barrage is arranged with extra grooves on the upstream and downstream sides; in case of repair being necessary, temporary coffer dams made of steel plate reinforced by lattice work, divided up for convenience into horizontal sections, are placed in these grooves, six on the upstream side and two on the downstream. They are put in place by means of dismountable lifting gear placed on the piers. To resist the extra turning moment which exists when these coffer dams are in use, the piers are reinforced by H iron embedded vertically in the concrete. For the building of the barrage a cableway was used, of 190 metres span, with a 3-ton lift.

The inlet to the head canal is joined to the barrage pier on the right bank of the river; it is protected by a grid 145 metres long (158.5 yd.), which is made of flat bars 60 mm. × 8 mm. (2.3 × .3 in.), inclined at an angle of 1 in 5, and leaving spaces of $2\frac{3}{4}$ in. It is supported by an armoured-concrete bridge. The upper end of the grid is connected to the wall of the inlet canal by means of a lifting grid, which allows rafts to pass along the canal, and eventually barges. In accordance with the concession for the hydraulic development, when a chain of power houses has been placed up the River Isère in accordance with the programme of development, means have to be provided for navigation; space therefore has been left alongside the power house which will allow of the construction of a lock 12 metres wide and 46 metres long.

The inlet canal is 1,600 metres (practically a mile) long; its walls and bottom are of concrete, 30 cm. (11.8 in.) thick where made of cement concrete, and 50 cm. (19.7 in.) where lime concrete is used; expansion joints made with bitumen sheeting are placed every 7 metres. The walls are sloped 1 in 1, the rendering at the normal water line being strengthened by armouring.

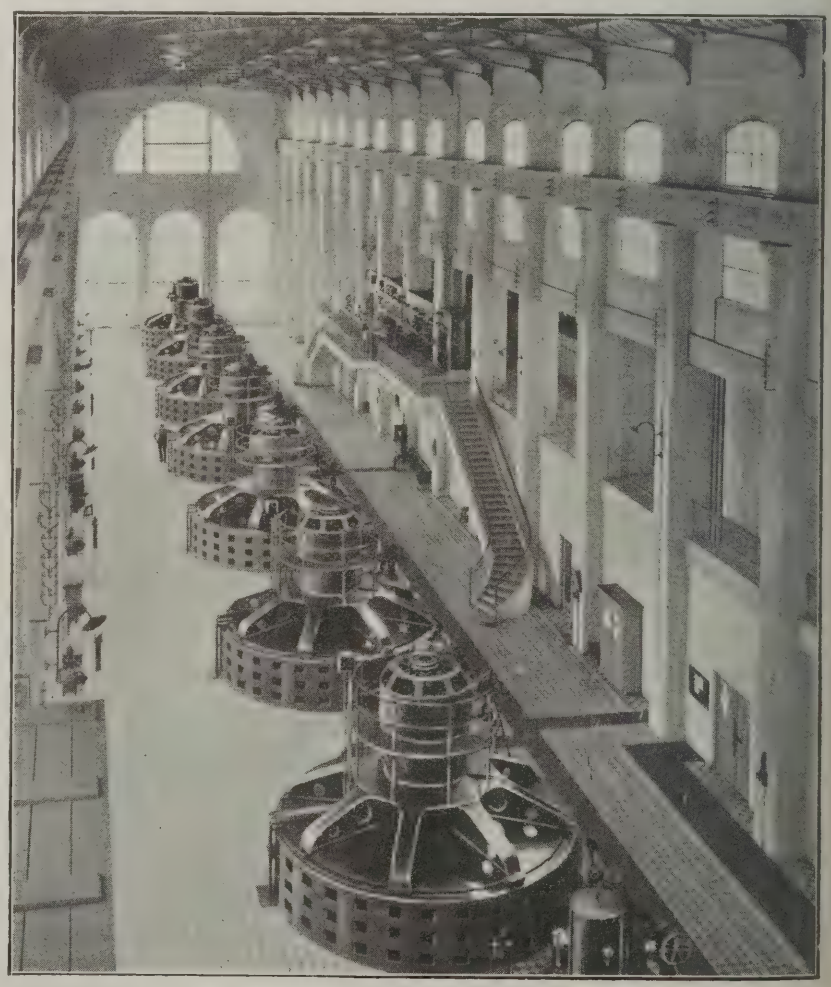

Fig. 5.—Interior of Power House.

The canal is 41.2 metres (135 ft.) wide and 4.6 metres (15 ft.) deep; the cross sectional area is 168.36 sq. metres, and the slope is 1 in 6,400, giving, according to the Bazin formula, a mean speed of 1.95 metres per second.

At the power station a grid is provided 73.5 metres wide, made up of bars 80 mm. × 10 mm. (3.15 × .39 in.) placed 2.75 in. apart; it rests against an armoured concrete trough, into which floating objects can be raked.

The Power Station.

The station is founded on a bed of compact clay, so that, although the foundations were sunk to 8 metres (26.2 ft.) below the mean level of the River Isère, it was not necessary to use compressed air. Fig. 3 shows a section, fig. 4 the downstream side of the building, and fig. 5 the interior of the station.

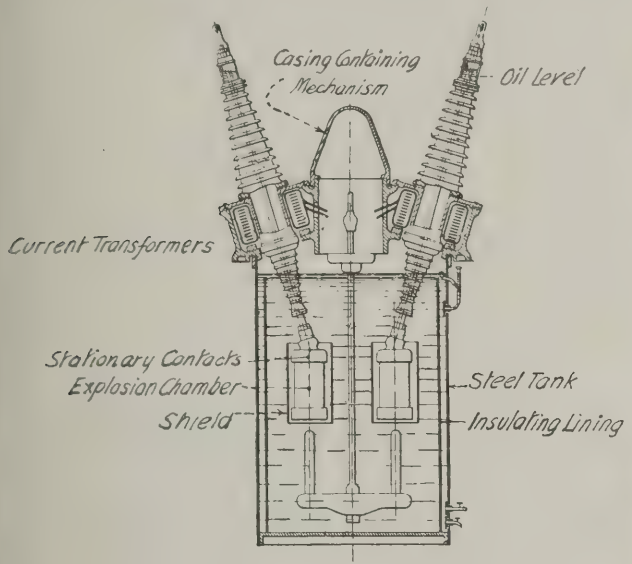

Fig. 6.—Section of 120,000-V Oil Switch.

There are seven turbine sets, of the vertical type, running at 107 revs. per minute, placed 10.5 m. (34.4 ft.) apart. The turbine house is 106 metres long and 15 metres wide; it is spanned by a 45-ton travelling crane. The turbine inlets are made of armoured concrete and they can be closed individually by steel sluices, which can be operated by hand or by electric motor; operation is facilitated by means of a by-pass valve by which the inlet chamber can be filled and equilibrium established. The draught tube is also formed in concrete. The outlet of each turbine is arranged in cells, which can be closed for examination by means of temporary coffer dams.

The turbines are of the Francis type, made by the firm of Neyret-Beylier and Piccard-Pictet, of Grenoble; they have an output capacity of 5,600 h.p. each, under a net head of 10.2 m. (33.45 ft.) and 6,400 h.p. with 11.3 metres (37.05 ft.) net head.

The turbine wheel is 4 metres in diameter, weighing 12 tons; it will pass 50 cubic metres of water a second. The wheel is bolted to a vertical shaft 400 mm. (15.75 in.) in diameter; the turbine shaft is supported by a water-cooled thrust bearing, which has to take the combined weight of the turbine wheel and alternator and the effect of the water flow, a total of 150 tons. Fig. 8 shows a wheel of cast iron made in one piece.

The turbine makers after considerable experiment developed and patented a thrust bearing to suit such conditions. A bell-shaped casting is fixed on the upper end of the shaft, the rubbing surface being a flat disk fastened to the casting by screw bolts. This disk revolves in an oil bath on a series of shoes separated by oil spaces, the shoes in turn being supported on a ring casting with a special seat. The revolving disk, when passing across the gaps between the shoes, draws the oil after it, and forms a film between the surfaces, and therefore without any oil pumping or pressure the bearing is kept cool and lubricated. A coil of copper pipes for circulating water is placed in the oil bath; from the point of view of bearing heating in the ordinary way, the use of this cooling coil has not been found necessary but it has been put in as a safeguard in view of the high temperature which sometimes occurs in the power station itself, due to atmospheric conditions. The turbine guide vanes are actuated by a governor and servo-motor, which can be controlled from the switchboard.

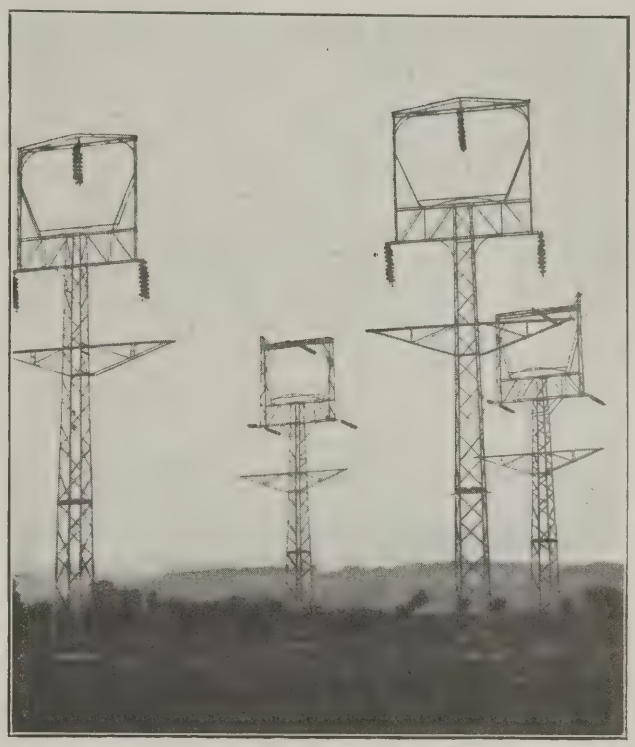

Fig. 7.—Transmission Line at Road Crossing.

The alternators each have an output of 5,720 kVA and are wound for 50 periods, 5,500 to 6,200 volts. They are of a type developed by the General Electric Co. of America; the first two were made in the United States, the others being constructed to the same design by the French Thomson-Houston Co., the contractors for the electrical equipment.

The rotor has a diameter of 4.88 metres (approximately 16 ft.), which at 107 revs. gives a peripheral speed of 90 ft. a second. The rotor wheel is of cast steel, the poles being built up of steel laminations; the rotor is designed to withstand a speed 2.1 times the normal. The windings are of the former type, placed in open slots, and have been tested at 13,000 volts. The neutral points of the star-stator windings are connected direct to earth. An 80-kW exciter, 250 volts, is placed above each alternator; regulation of the alternator is carried out by variation of the exciter voltage. A voltage relay operated from the potential transformer of the alternator, working a contactor, short-circuits part of the rheostat of the exciter fields and reduces the voltage of the alternator to a low value after each opening of the main circuit breaker.

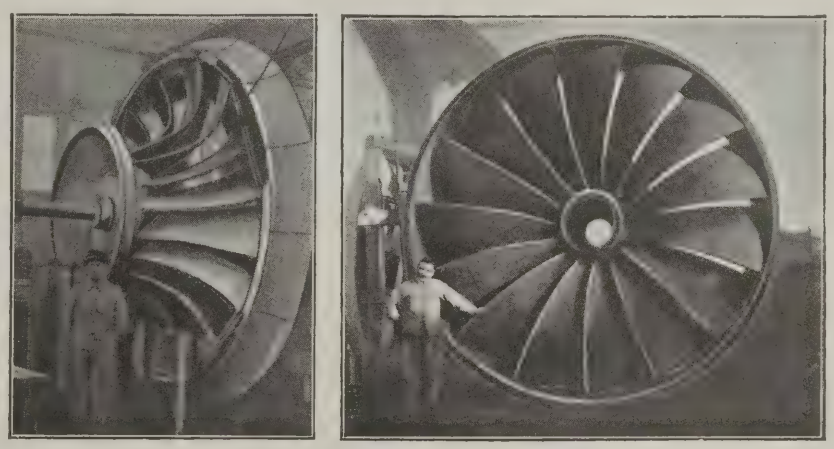

Fig. 8.—Two Views of the Turbine Wheel.

The main switchboard floor has the alternator operating desks for the 6,000-V oil switches. The connections to the alternators are of bar copper supported on insulators. There are two sets of bars; the oil switches can be released by maximum or differential relays. The low-pressure side of the step-up transformers can be connected to either set of bars. There are two 260-kVA, 3-phase transformers, 6,000/220 volts, for the operation of the traveller and other auxiliary motors. The 6,000-volt switches are of the G.E.C. (America) type, designed to break 90,000 kVA per pole. Each phase has two separate cylindrical oil containers placed in a separate cell made of insulating material.

Step-up Transformers.

The main transformers are placed out of doors under a skeleton steel structure, which carries the h.p. insulators (fig. 9). There are two sets of 120,000-V bars, and each of the two lines can be connected to either set by means of section links and a switch connected to each. The outdoor bus-bars are made up of aluminium-steel cable hung on to a double set, each of eight "Hewlett" insulators.

There are four groups of transformers, each made up of three single-phase, 3,333-kVA units. The primary pressure is 5,500 to 6,200 volts, and secondary 55,400 to 69,200 volts; the primaries are connected in delta and the secondaries in star with the neutral direct to earth, each group therefore giving the pressure required for the 120,000-V line. The transformer tanks are cylindrical, 2.15 metres (7 ft. 6 in.) in diameter, 4.70 metres (15.5 ft.) high, and 6.40 metres (about 21 ft.) to the top of the insulators.

The transformer oil is cooled by means of a water coil made of copper pipes. A dial thermometer, connected with the oil in the upper central part of the tank by means of a flexible pipe, is placed on the outer wall of the tank. Each transformer is fitted with a compensator and an air dryer connected with the space above the oil level. A safety device is arranged, consisting of a sloping pipe attached to the cover, which ends in a flexible diaphragm; should any excess pressure be developed inside the tank, the diaphragm bursts and allows the excess oil to escape.

Great care was taken in the installation of the transformers; the windings were dried by means of the circulation of hot air in a special chamber by a motor-driven fan, the air being filtered before entry and heated by a 25-kW heater. The oil itself was dried by a 65-kW, 3-phase resistance heater. Special oil-testing transformers, with disk electrodes and motor-driven portable filter presses, were supplied by the French Thomson-Houston Co. for use with these transformers. The terminals are of the condenser type. The oil switches, fig. 6, are of a type developed by the General Electric Co. of America. Each pole is in a separate tank, each tank having an insulated lining. The switches are designed to break 2,400 amperes at 135,000 volts. The operating and trip gear, which is controlled from the main switchboard, is worked by d.c. at 125 V.

For the protection of the transformers, differential relays are arranged which trip the switches simultaneously on the h.p. and l.p. sides. The transformers are connected to the h.p. bus-bars through the above-mentioned h.p. switches, and the two feeders are connected to the bars by means of oil switches with maximum relays. For the operation of the relays, and in the case of the feeder switches for the supply of current to ammeters as well, series transformer coils are placed round the oil-filled inlet and outlet porcelain insulators of the 120,000-V switches, as can be seen from fig. 6.

For the protection of the line against disturbances, aluminium electrolytic dischargers have been installed of the type developed by the General Electric Co. of America. There are four dischargers on each line, three connected by horns to the line and the fourth connected between the neutral point of the first three dischargers and the earth. Each set consists of two columns of aluminium cones in series in an electrolyte, the whole being contained in an oil-filled tank. The hydroxide film is reformed daily by passing current through carborundum resistances, the operation being made simultaneously for the three phases with the aid of interlinked connectors mounted on insulators.

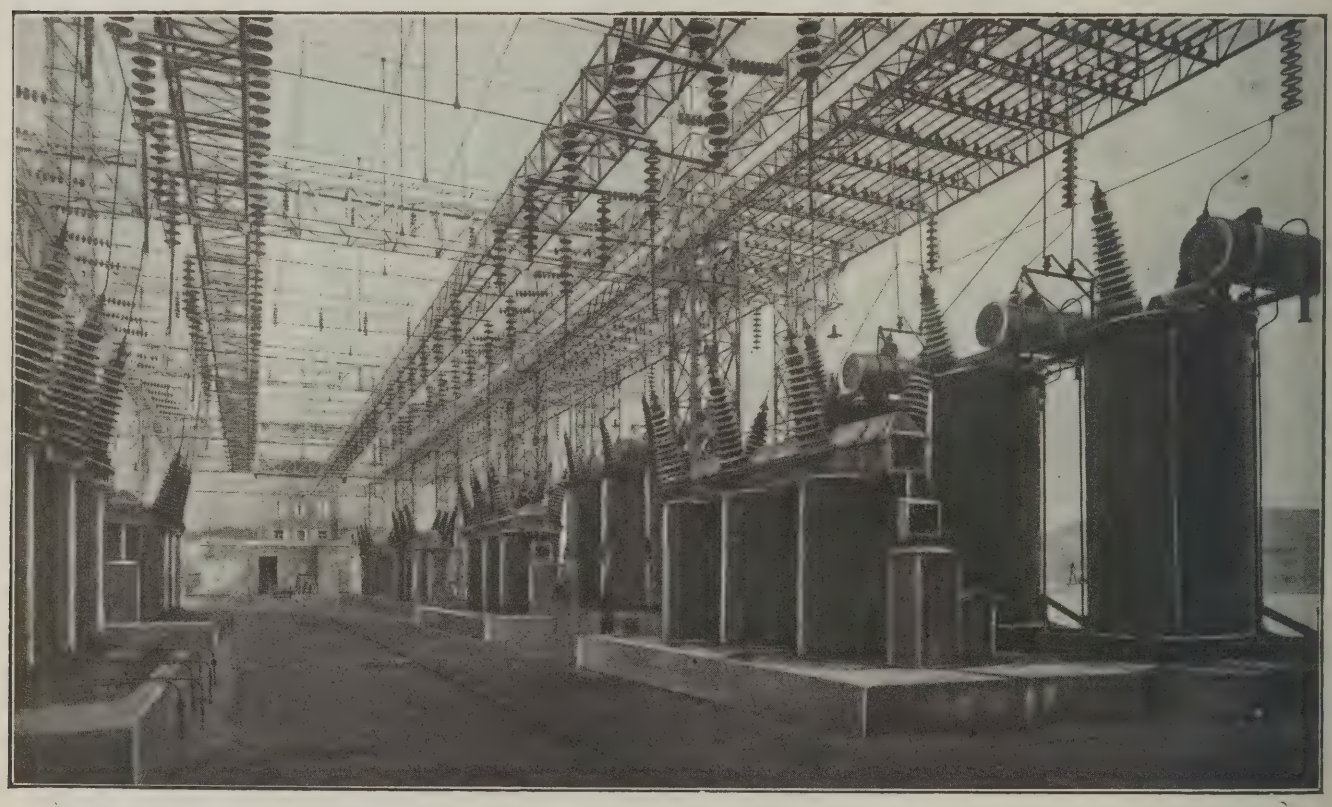

Fig. 9.—Outdoor Transformer and Switching Station.

Although subjected from time to time to heavy surges and discharges due to storms (in two cases breakages of line conductor and earth conductor respectively have been attributed to direct lightning strokes) the electrolytic dischargers have given perfect protection. Monsieur Limousin, the local director of the Basse-Isère Co., in the house journal of the French Thomson-Houston Co., of Paris, in the November-December number, has given interesting details regarding the operation of the transformers, oil switches and electrolytic dischargers adopted for this installation.

(To be concluded.)

Tramway and Railway Notes.

(*Continued from page 794*)

Burnley.—Mr. H. Mozley, Burnley tramway manager, has sent an appreciative letter to all the men who volunteered for service during the general strike. Suitable volunteers desiring to join the regular staff will take precedence of those candidates now on the waiting list when vacancies arise.

Liverpool.—NEW DEPOT.—The foundation stone of the Corporation tramway works, which will cost £385,000, was laid recently. The area of the site is 15½ acres; tramlines on premises will be 3¼ miles; and the constructional steelwork will weigh 3,000 tons. The design of the works was prepared by the tramway general manager, Mr. P. Priestly, who has laid out the whole scheme. The rolling stock of the Corporation consists of nearly 800 vehicles, comprising tramcars, motor 'buses, motor cars, tower wagons, &c. The works, when completed, will be capable of employing at full strength about 1,000 men.

New Zealand.—RAILWAY ELECTRIFICATION.—According to the *Australasian Electrical Times*, proposals for the electrification of the suburban lines running from Wellington, Auckland and Dunedin, are now being examined by the electrical and mechanical engineers of the Railways Department. It is intended for the present to electrify the Lyttelton Tunnel line at Christchurch. Arrangements are being made for the calling of tenders to carry out the work which will be put in hand without delay.

Southern Railway Electrification.—*The Times* reports that the Southern Railway intends to adhere to the programme for the opening of the electrified lines from Charing Cross and London Bridge to Dartford *via* Woolwich, Bexley Heath, and Sidcup, on June 6th, and to proceed with the reconstruction of the lines and platforms at Cannon Street Station, which will be closed, as announced, from June 5th until June 26th. It is more than probable, however, that the services will be restricted, owing to the coal stoppage.

United States.—PITTSBURGH.—According to the *Electric Railway Journal* another step toward providing Pittsburgh with a rapid transit system has been made by a report recently submitted to the City Council by the City Transit Commission. It approves the immediate construction of the first part of the rapid transit system recommended by Mr. D. L. Turner, consulting engineer, and Mr. W. Haydock, chief engineer, of the Department of City Transit. The sections approved are a subway from the vicinity of Federal and Ohio Streets on the north side, *via* Federal Street and Fifth Avenue to Neville Street, in the Shadyside district, to be used by rapid transit trains, and another subway, less than a mile in length, on Grand Street, in the downtown section, to be used temporarily by surface cars. Later, this would form part of a rapid transit line. The City Transit Commission recommends the construction of these lines by the city and their lease to the Pittsburgh Railways under contract. Under this contract the railway would supply the rolling stock, electrical equipment, &c. The city's contribution would be $36,000,000 and the railway's $4,860,000. The Commission recommends a referendum at the next election on the question of authorising the city to float an issue of bonds to the amount of $30,000,000.

Telegraph and Telephone Notes.

Australia.—TELEGRAPH SERVICE.—So soon as the route of the new road from Sydney to Newcastle is decided, the Post Office authorities are to lay a telegraph cable between those two towns, which will provide for at least 100 direct lines between the two cities. That scheme will cost £250,000. Meanwhile valve amplifiers on the line between Sydney and Melbourne are to be used to give some relief on the Sydney-Newcastle lines. By this system one line can be used for ten messages simultaneously.

AUTOMATIC TELEPHONY.—There has been a large increase in the use of the telephone service in New South Wales. The subscribers now number 114,182, as compared with 92,329 two years ago, and the problem so far as Sydney is concerned is the building and equipment of exchanges. Each costs about £200,000, being of the automatic type, and new exchanges in the suburban areas are also automatic.

Egypt.—WIRELESS CONCESSION.—It is understood that General Manifold, acting on behalf of Marconi's Wireless Telegraph Co., Ltd., has secured a 30 years' concession from the Egyptian Government to conduct a radio-telegraph service in Egypt.

Hungary.—TELEPHONE IMPROVEMENTS.—The Hungarian Post Office is to spend a large sum on improvements, including the reorganisation of the Budapest telephone system. It has been decided to introduce an entirely new automatic system. The Budapest system, with three exchanges, is now sufficient for 37,000 subscribers, which figure is to be increased by two stages to 65,000, and the service will be improved by laying subterranean cables. The sums required by the Post Office for the realisation of the plan will be loaned by the State.—*Reuter's Trade Service* (Budapest).

Spain.—TELEPHONE CONSTRUCTION.—The Compañía Telefónica Nacional de España, to which the practical control of the telephone systems of Spain has been granted, has decided to enter upon a wide programme of new construction. In addition to a further line between Barcelona and Madrid, new circuits will be laid to Castellón, Valencia, and Tarragona, and a completely new circuit will be installed between Barcelona, Granollera, and Nataro. When the improvements and extensions are completed, Barcelona will have six new circuits to Madrid, two to Bilbao, three to Zaragoza, and one to San Sebastian.—*Reuter's Trade Service* (Madrid).

The Telegraph Service.—PRESS TELEGRAMS.—Lord Wolmer recently stated in the House of Commons that the revenue from Press telegrams last year was £84,000, and the expenditure amounted to £330,000.

Radio Notes.

Canada.—AMALGAMATION.—All the broadcasting stations in Canada have recently amalgamated under the name of the Canadian Association of Broadcasters. By means of general co-operation and relaying it is hoped to improve the general standard of the programmes.

Germany.—REVISED REGULATIONS.—Recent changes in the radio regulations cancel the requirements that apparatus be tested and marked by the Federal post office, and manufacturers are no longer required to submit a sample of every series of receivers built; listeners are no longer required to be members of an approved radio club. According to *Commerce Reports* a reduction in the amount of manufacturers' licence fees has also been made.

Irish Free State.—IMPORTED APPARATUS TAX.—In Dail Eireann, when the consideration of the Budget resolutions was on, Major Bryan Cooper tried to have the tax on wireless apparatus reduced from 33⅓ to 5 per cent., because the high duty was calculated to check the progress of a new industry. Mr. J. J. Walsh, Minister for Posts and Telegraphs, defended the imposition of the 33⅓ per cent. tax as being one means of bringing crystal sets within the reach of everyone. It was calculated that the revenue from licences would amount to £20,000, and, with the revenue from the tax on imported sets, he believed that he would later on be justified in asking for the necessary funds to equip three extra wireless stations in the Free State with a power equivalent to that of the Dublin station. The proposed new stations would in due time bring everyone in the country within crystal radius.

Japan.—AMALGAMATION.—Now that the novelty of wireless is said to be wearing off, there seems little to broadcast, and, the gramophone being more popular, the Government is reported to be attempting to amalgamate the Tokio, Nagaya, and Osaka stations.

Licences in France.—DELAYED ISSUE.—Mr. Harry Day, M.P., has received from the Foreign Office a reply to a question he raised about delay in granting licences for receiving sets to British subjects resident in France. The British Ambassador at Paris has been informed by the French Government that it is only in very exceptional cases that licences have been refused. Although the French reply does not give any reasons for the delay in the grant of licences, says the *Financial News*, Lord Crewe has since heard that several British subjects, resident at Le Havre, who had hitherto been unable to obtain their licences, have now all received them.

United States.—LABOUR AND WIRELESS.—The weekly bulletin of the International Federation of Trade Unions contains the following:—The Chicago Federation of Labour has obtained permission from the City Council to erect a broadcasting station and aerial at the municipal pier, which was formerly used as a wireless station by the American Navy. The Labour movement will finance and control the station, which is intended to counteract the anti-Labour propaganda of the local newspapers and also to transmit messages to Labour centres in the United States of America and abroad. The local Typographical Union has voted 10,000 dollars for the station, and the Chicago Federation of Labour suggests that local unions raise a levy of two dollars per member; one-half of the sum so collected to be used to purchase and erect the station and the other half to endow its permanent maintenance.

In Holland the Workers' Wireless Association, which hires the national wireless station one evening each week in order to conduct its own propaganda, seized the opportunity last week of broadcasting in English, French, and German reports received from the International Transport Workers, the International Federation of Trade Unions, &c., on the situation in Great Britain.—*Reuter* (The Hague).

DRASTIC INTERFERENCE LAW.—A recent occurrence in Nebraska indicates the drastic extreme to which some city councils are likely to go in attempting to prevent radio interference, when complaint is made by even a few irritated listeners. Just three such persons, alleging that their trouble was due to the Central Power Company's transmission lines, were able to convince the Mayor of Grand Island and the City Council that an ordinance should be passed compelling the Company to remove all of its 33,000-volt lines from the city within 90 days. Because of enlightenment of the City Council by a broadcast listeners' league, the *Electrical World* expects that the ordinance will be repealed.

CONTROL OF RADIO.—The Senate Interstate Commerce Committee has approved the Dill Radio Bill providing for a commission to have control of air communication. The Commission would have supreme power in its field, the Committee having eliminated a provision for appeals to the courts to compel the issuing of broadcasting licences, or prevent the rescinding of them. The Bill's supporters hope to get it passed this session, holding that recent court decisions have made immediate legislation imperative.—*Reuter's Trade Service* (Washington).

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—June 28th. Electricity Commission of Victoria. 22,000-V transformers and spares (B.X. 2528).*

June 16th. Victorian Government Railways. One heavy-current motor generator set. (B.X. 2527).*

June 16th. City Council. Turbo-alternator, exciter and condensing plant.*

August 11th. H. and l.p., 3-phase sub-station switchgear.*

August 3rd. Postmaster-General's Department. Telephones and dials.*

BRISBANE.—August 26th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator.*

Canada.—June 2nd. Department of Public Works. One 25-ton electrically-operated portal crane for Esquimalt Dry Dock.*

Belfast. — June 12th. Electricity Committee. D.c. switchgear for sub-stations and transformer kiosks. (See this issue.)

Bristol.—June 14th. Electricity Department. Additions to the premises at Feeder Road generating station. (See this issue.)

Dublin.—June 3rd. Great Northern Railway (Ireland). Six months' supplies of stores, including electrical fittings, lamps, cable, wire, &c. (May 14th and 21st.)

Eccles.—May 31st. Electricity Department. Twelve months' supply of single-phase a.c. house-service integrating watt-hour meters. (May 14th and 21st.)

Egypt.—CAIRO.—June 30th. Ministry of the Interior. One Diesel engine, direct coupled to an 80-kW generator, complete with switchboard. (B.X. 2537).*

June 19th. Minister of Education. Dynamo and motors.*

Egyptian State Railways, Telegraphs and Telephones. Underground cables. Chief Inspecting Engineer, Queen Anne's Chambers, Broadway, Westminster, S.W.1.

Erith.—June 7th. Electricity Department. L.p. cables. (See this issue.)

Epsom.—June 14th. Electricity Department. Removal of boilers and setting them up as fuel tanks, overhead travelling crane, two 300-kW Diesel engine-driven generators and accessories, oil-purifying plant and cooling tower. (See this issue.)

Glasgow.—June 2nd. Corporation. Electric lighting installations at Wellmeadow and Cathcart Road housing schemes. Particulars from Mr. R. B. Mitchell, Corporation electrical engineer.

Harrogate.—May 31st. Electricity Department. Electricity meters (British make) for six months. (May 14th and 21st.)

Hull.—Telephone Committee. Copper jointing sleeves. (May 7th.)

India.—June 15th. India Store Department. 70,000 (approx.) copper bonds for track rails. (May 14th and 21st.)

June 11th. Wireless transmitting sets. Particulars from Department, 11, Belvedere Road, S.E.

Kettering.—June 9th. Electricity Department. Water-softening plant. (May 14th and 21st.)

London.—BETHNAL GREEN.—June 4th. Borough Council. Electric lighting and power installation at Bethnal Green Hospital. (May 14th and 21st.)

June 16th. Metropolitan Asylums Board. Installation of electric cable for arc light treatment apparatus at St. Luke's Hospital, Lowestoft. (See this issue.)

Manchester.—June 1st. Board of Guardians. Two electric hospital bed lifts, Withington Hospital; one ditto, Crumpsall Infirmary; and one electric passenger lift, Union Offices, All Saints. Particulars from Mr. E. Hargreaves, superintendent of works, Union Offices, All Saints, Manchester.

June 4th. Electricity Committee. Two portable air compressors for High Street Depôt. Specification from Mr. H. C. Lamb, manager, Electricity Department, Town Hall.

June 5th. Renewals and additions in connection with X-ray plant at Booth Hall Infirmary, Charlestown Road, Blackley. Specifications from Mr. F. W. Greenhalgh, clerk to Board of Guardians, Union Offices, All Saints', Manchester.

Middlesbrough.—Electricity Department. Extension of electricity supply distributors, total length approx. 1,000 yd. (April 30th.)

New Zealand.—AUCKLAND.—June 21st. Electric Power Board. L.p. insulators, &c.*

Public Works Department. July 20th. Phase transformer for Mangahao electric power scheme.*

New Zealand Railway Department. June 16th. Electric motors.*

August 30th. 400-V, 3-phase, slip-ring induction motors and starters.*

Normanton.—June 1st. Urban District Council. Feeder and distribution cables, feeder pillars, and one 200-kVA transformer. (May 14th and 21st.)

Nottingham.—May 31st. Board of Guardians. One 60-kW d.c. turbo-generator, &c., and alterations to main switchboard, &c. (April 16th.)

Otley (Yorkshire).—June 2nd. Electric lighting at new public slaughterhouses at Station Road. Particulars from Mr. C. J. F. Atkinson, Clerk to the U.D.C.

Rhyl.—June 16th. Electricity Department. 1,000 yd. l.p. armoured cable, 1,915 yd. 11,000-V feeder cable, and switchgear equipment. (See this issue.)

Roumania.—BUCHAREST.—June 8th. Bucharest Tramway Co. 10 000 kg. electrodes, 1,000 kg. electrolytic copper, 3,000 electrolytic copper contact pieces, 1,200 kg. copper plates, 200 kg. brass sheets, 2,500 kg. black insulating varnish.*

South Africa.—June 21st. South African Railways and Harbours. Track bonds for the Cape Town Suburban Railway electrification scheme. (See this issue.)

June 3rd. South African Railways and Harbours. One motor-starting panel.*

June 10th. D.c. electric generating plant (suction gas).*

JOHANNESBURG.—Municipal Council. 8 miles h.p. cable, 41 miles l.p. cable.*

Southern Rhodesia.—June 21st. Department of Posts and Telegraphs. Automatic telegraphs. Automatic telephone exchange for Salisbury. (April 23rd.)

Stoke-on-Trent.—June 9th. Electricity Department. Two 60,000-lb. per hour water-tube boilers. (May 14th and 21st.)

Uruguay. — MONTEVIDEO. — July 6th. State Electricity Works. 1,000,000 metres of insulated conductors. (B.X. 2523).*

July 9th. 137,500 metres rubber-insulated wires and cables. (B.X. 2548).*

40,000 metres of coloured twin conductor cords. (B.X. 2549).*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—MELBOURNE.—Electricity Supply Committee. Accepted:—

Armour-clad switchgear (£19,985).—A. Reyrolle & Co., Ltd.
Spare turbine parts (£650).—Metropolitan-Vickers Electrical Co., Ltd.

SYDNEY.—Electricity Supply Committee. Recommended:—

Maximum demand indicators (£1,635).—Edison Swan Electric Co., Ltd.
Armour-clad switchgear for sub-station (£104,693), six sets of current transformers (£227), six Fawssett-Parry relays (£192), two 10,000-V feeder panels (£926).—Metropolitan-Vickers Electrical Co., Ltd.
Double-braided weather-proof cables (£4,792).—Enfield Cable Works (Aust.), Ltd. *Tenders.*

Barton-upon-Irwell.—Board of Guardians.—At the meeting of the Guardians last week, protests were made, says the *Daily Dispatch*, against the acceptance of the tender of Bell Bros., of London, at £8,430, for electrical work at the new hospital at Davyhulme. The Ministry of Health had sanctioned the borrowing of £8,430 for the purpose, and it was pointed out by the clerk that the accepted tender was the lowest. Offers from Manchester firms were as high as £10,000. Several members of the Board thought the contract should have been given to a local firm. After considerable discussion, the tender from Messrs. Bell Brothers, recommended by the Ministry, was accepted, with the proviso that local labour should be employed as far as possible.

Belgium. — German, Belgian, Dutch and British (Callender's Cable & Construction Co., Ltd.) firms recently submitted tenders to the Belgian State Railway authorities in Brussels, for the supply of 101 kilometres of insulated cable in two lots of respectively 11 and 90 kilometres. For both lots, the lowest offers were those of Belgian concerns.

Bury St. Edmunds.—Town Council. Accepted:—

Boiler (3,850 sq. ft. heating surface), with superheater.—Babcock and Wilcox, Ltd.

Corsham.—Parish Council. Accepted:—

Installing electric light at the Town Hall.—Edwards & Armstrong.

Croydon.—Electricity Committee. Recommended:—

Switchgear (£507).—Metropolitan-Vickers Electrical Co., Ltd.
Water-softening plant (£1,150).—Becco Engineering and Chemical Co., Ltd.

Edinburgh.—Corporation. Accepted:—

12 months' supply of single-phase meters.—Edison Swan Electric Co., Ltd.

Hazel Grove and Bramhall.—Urban Council. Accepted:

Mains extensions in the Woodford Fringe area (£1,209).—W. T. Glover and Co., Ltd.

Irish Free State.—DUBLIN.—Ministry of Local Government and Public Health (Trade Section).

Contracts for supplies to local authorities for 6 months :—

Vacuum draw wire, M.F. electric lamps, one-watt type, 10 to 100 watts.—Briscoe Importing Co.

Spiral vacuum lamps, half-watt type, 30 to 100 watts, 50 to 260 V.—Sphinx Electric Co.

—*Irish Builder and Engineer.*

CITY COMMISSIONERS. Accepted :—

Switchgear for Pigeon House and Fleet Street stations (£4,705 and £6,369).—Ferguson, Pailin, Ltd.

London.—STEPNEY.—Electricity Supply Committee. Recommended :—

Meters and combined meters and demand indicators for 12 months :—2½ to 25 amp. meters (£7,238).—Reason Mfg. Co., Ltd.

Prepayment meters (£672) and 50 and 100 amp. meters (£229).—Ferranti, Ltd.

Combined meters (£363).—Aron Electricity Meter, Ltd.

Time switches for 12 months (£1,200).—Venner Time Switches, Ltd.

Conduits and troughs and covers for 12 months (£3,111).—Albion Clay Co., Ltd.

Wiring L.C.C. tenements, Willoughby House, Dundee Street, Wapping (£394).—L. G. Tate & Co., Ltd.

7,570 fuse boxes (£1,084).—W. T. Henley's Telegraph Works Co., Ltd.

Rotherham.—Corporation. Accepted:—

Paper-insulated taped and armoured cables.—Edison Swan Electric Co., Ltd.

Shipston-on-Stour.—Board of Guardians. Accepted:—

Installing electric lighting at the casual wards.—Shipston New Electric Lighting Co.

Southend-on-Sea.—Town Council. Accepted:—

1,450 current limiters (£1,160).—Chamberlain & Hookham, Ltd.

Forthcoming Events.

Illuminating Engineering Society.—Tuesday, June 1st. At the Royal Society of Arts, John Street, Adelphi, W.C. At 7 p.m. Discussion on "Research in Illumination," to be opened by Mr. J. W. T. Walsh.

Roentgen Society.—Tuesday, June 1st. At 32, Welbeck Street, W. At 8.15 p.m. Ordinary meeting.

Institution of Electrical Engineers (Wireless Section).—Wednesday, June 2nd. At Savoy Place, Victoria Embankment, W.C. At 6 p.m. Paper on "Low-frequency Intervalve Transformers," by Mr. P. W. Willans.

Notes.

Northern Ireland Power Resources.—The Development Commission appointed by the Government of Northern Ireland to investigate the natural and industrial resources of Ulster has submitted a report to the Government, recommending the increased use of electrical power and the electrification of railways. The Commission's recommendations include the granting of additional powers to the Electricity Commissioners, financial assistance to new schemes, the expansion of the power stations of the Belfast and Londonderry undertakings, and the utilisation of the River Bann and the tides of Strangford Lough. The report will be dealt with more fully in a later issue.

The Yallourn Scheme, Australia.—The report of Mr. Willetts Sawyer, the American expert, upon the Yallourn (Victoria) electricity scheme has been published; according to the *Financial News*, it declares that the scheme is fundamentally sound, but recommends the postponement of the expenditure of half a million sterling authorised by Parliament until modern methods have been investigated. The report also recommends the appointment of Mr. Clements, managing director of the Melbourne Electric Supply Co., as an additional Commissioner, which post the Government has asked Mr. Clements to accept. Mr. Sawyer reports against the extension of the briquetting plant.

Tramways and Light Railways Association.—ANNUAL CONGRESS.—The programme of the annual congress of the Association, to be held at Torquay from June 23rd to 26th, commences with an informal reception by the directors of the Torquay Tramways Company on Wednesday evening, June 23rd. On Thursday the Mayor and members of the Corporation will formally receive the visitors at the Town Hall, and afterwards Mr. L. M. Myers will read a paper on "Competition of Motor Omnibuses with Tramways." The Mayor and Corporation will entertain the members at luncheon, and in the afternoon there will be an excursion to Widdecombe. On Friday the annual meeting of the Association will be held, and a report on "Tramway Rolling Stock" (by a Joint Committee of the two Tramway Associations) will be introduced by Mr. C. J. Spencer, O.B.E., and discussed. In the afternoon there will be an excursion to and on the River Dart, and in the evening the Association will be entertained at dinner by the directors of the Torquay Tramways Co.

Depreciation of Railless Trolley Cars.—The Principal Inspector of Taxes, after a conference with representatives of the Tramway Associations, has made an offer that the annual allowance for depreciation should be 15 per cent. on the written-down value of railless cars, in addition to obsolescence, the arrangement to continue for a period of five years. The Council of the Tramways and Light Railways Association recommended the acceptance of this offer to its members.

A Large Diesel Engine.—What is claimed to be the largest Diesel engine so far constructed, is at present being installed in the Neuhof power station at Hamburg of the Hamburg Electricity Supply Co. The engine, which has been built by the Blohm and Voss Co., of Hamburg, to the designs of the Augsburg-Nuremburg Maschinenfabrik, is of the two-stroke type and comprises nine cylinders with a bore and stroke of 860 by 1,500 mm. The engine, which is expected to develop 15,000 h.p. at 54 r.p.m., is 76 ft. long, 14 ft. wide, and 38 ft. in height.

Fatalities.—While on a bird-nesting expedition, an 11-year old Barnsley boy, Arthur Wilfred Lane, climbed a pole carrying a transmission line from the Yorkshire Electric Power Company's works at Barugh, and came in contact with the line. He received severe burns and died in hospital later. At the inquest recently, John Willison, operation superintendent in the employ of the Power Company, suggested that the boy made contact with the earth wire on which he was standing and the box terminal. This short circuit would cause a huge flame, but no current would pass through the boy's body. The voltage was 11,000.

On May 22nd, an inquest at the St. Pancras Coroner's Court was held on Arthur Henry Jeffreys (52), who died as the result of a fall from a staging in the St. Pancas electricity works. The deceased was employed by International Combustion, Ltd., and was engaged on the erection of a new bunker. A verdict of accidental death was recorded.

Illuminating Engineering in Italy.—Under the auspices of a number of leading Italian electrical engineers, an Italian National Association for the Development of Illumination has recently been organised in Milan. The object of the new body, which it is hoped will receive the financial support of electric lighting undertakings throughout Italy, as well as electrical engineering firms, is to promote the study of improved means of public and private lighting with the purpose of developing the further use of electricity for illuminating purposes. The Hon. Signor Motta has been elected president of the new association, whose offices are temporarily at those of the Edison Co., in Milan, while Signor Carlo Clerici has been appointed director.

Technical Education.—In his presidential address to the Association of Teachers in Technical Institutions at its annual conference, on May 24th, Mr. A. E. Evans, B.Sc., outlined the objects of the Association and defended technical education and training centres. All forms of education, he said, are not separate entities, but merely aspects of one indivisible whole, education. The recent Coal Commission deplored the lack of adequate facilities for research into the methods of winning and utilising coal. Electricity Commissioners might formulate comprehensive schemes for the supply of power; the skilled engineer educated at our technical colleges and schools would interpret these schemes in the light of engineering practice.

Appointments Vacant.—Charge engineer, for the South Lancashire Tramways Co.; junior assistant engineer for the Borough of Newport (Mon.) Electricity Department; general fitter (electrical) (90s.) for the Southwark Hospital, East Dulwich Grove, S.E. Assistant secretary (£551 approx.), for the City of Birmingham Electric Supply Department. (See our advertisement pages to-day.)

Electrical Refrigeration in America. — According to statistics collected by the McGraw-Hill Publishing Co., the number of manufacturers of electrical refrigerators in the United States has increased from five to fifty within a few years and twelve fresh firms have just taken up this branch of production in anticipation of the coming summer demand. The number of electrical refrigerators in use in American homes has increased from 3,000 to over 142,000 within the last six years, and approximately 75,000 were sold during 1925. About 200 homes substituted the electrical appliance for the ice box in 1925, and it is confidently anticipated that the number will reach 500 in 1926. Pointing out that at the present rate of development the next few years will see several million homes solving their refrigeration problems by electricity, Mr. Arthur Williams, of the New York Edison Company, recently said: "Six years ago household refrigerators occupied a position analogous to that occupied by the automobile in the early days of the automotive vehicle industry. It was only in 1923 that electric refrigerators began to be considered a household convenience within the reach of almost any American family and in that year alone more than four times as many homes were equipped with electric refrigerators as during the previous ten years." The great strides taken in the last few years towards transforming the household refrigerator into another electrical appliance for the home, reducing refrigeration costs and increasing its efficiency, are largely due to the efforts of power station companies throughout the country. To-day the smallest of the three leading companies in the electric refrigerator business has a paid-up capital of $5,000,000.

High-Pressure Rectifier Plant.—From an illustrated leaflet issued by Messrs. Brown, Boveri & Co., we obtain the following particulars of a 4,000-V (d.c.) power-rectifier plant which is claimed to be the only equipment of that description in existence designed for such a high d.c. pressure. The normal output is 800 kW with an overload rating of 25 per cent. for 30 min. and 200 per cent. momentarily. It is claimed to have an overall efficiency of 97.5 per cent. The plant is installed in Italy at the Ciriè sub-station of the Turin-Lanzo-Ceres Electric Railway and is used to convert 3-phase energy at 36,000 V to d.c. at 4,000 V.

The International Tramway Congress.—The 20th annual congress of the International Union of Tramways, Local Railways and Public Motor Transport Services is to be held in Barcelona in October next. Among the subjects to be discussed in the electrical section are the standardisation of traction motors, electric transformer stations, mercury rectifiers, and remote control.

Stepney and the Strike.—At a meeting of power users in the borough of Stepney last week, a committee was formed to inquire into the circumstances of the stoppage of the electricity supply from the Council's station during the strike and to report with a view to the institution of legal proceedings against the Council.

A Link with the Atlantic Cable.—Replying to an inquiry in the *Overseas Daily Mail* for news of survivors of the voyage of the s.s. *Great Eastern* when she was engaged in laying the Atlantic Cable, in 1866, Mr. William Cuming, of St. Albans, New Zealand, wrote to the *Daily Mail* of May 19th, stating that he was employed as an extra engineer, attached to the staff of the screw department. "The engineering staff of the ship, both for paddle and screw, were under the supervision of Mr. Beckwith as chief. The scientific staff included Captain James Anderson, Professor Thomson (afterwards Lord Kelvin), Daniel Gooch, Cyrus Field, Glass, and others, afterwards knighted for eminent services. I regret that I at 86 am very nearly the last survivor of an expedition which aroused the deepest interest in the mechanical world."

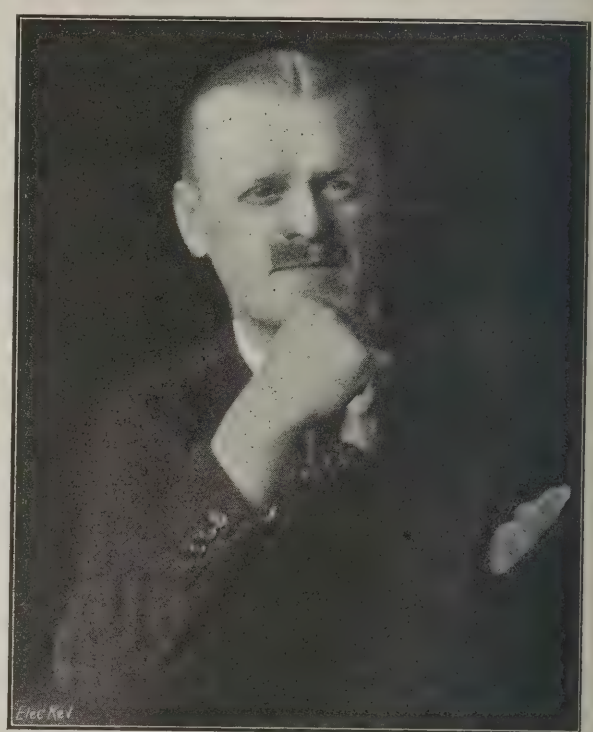
An American Electrical Leader Dissatisfied.—In an article upon Mr. James E. Davidson, the president of the (American) National Electric Light Association, appearing in *Electrical Merchandising*, it is stated that Mr. Davidson considers that "the electric light and power industry should stop preening itself over its size and think of the absurdly small amount of its sales to the average home. He believes that a capital investment turnover of once in five years, compared with the five turnovers a year of the successful merchant, is a reproach to electrical men. He believes that load factors of 30 and 40 per cent. are something not to be put up with but to be overcome by ingenious selling, just as the telephone and telegraph companies have largely solved their problems with night message offers." It is further stated that "what the household wants is not raw kilowatt-hours, but help in washing, ironing, refrigerating, cooking, heating, cooling, lighting and so on, human service that can only be rendered when appliances are installed." Accordingly, Mr. Davidson calls upon the central station industry to improve its business-getting and appliance-selling organisation.

Electrical Association for Women. — The luncheon arranged in connection with the first annual general meeting of this Association will take place at the Hotel Cecil, London, on Friday, June 4th, at 1 p.m. (not at the Criterion Restaurant as previously arranged). Lieut.-Col. Wilfrid Ashley, M.P., Minister of Transport, and Sir Hugo Hirst, Bart., have again promised to speak on this occasion.

A Strike Sequel.—According to the *Daily Dispatch*, Mr. A. R. Fearnley, general manager of the Sheffield Corporation Tramway Department, has issued writs for alleged libel against representatives of the Sheffield Trades and Labour Council and the printer of a strike bulletin issued by that body. The action arises out of a statement complaining of the way in which it was alleged Mr. Fearnley conducted, during the strike, a ballot of the Sheffield tramwaymen on whether they would return to work. The writs have been issued against Councillor E. G. Rowlinson, A. Barton, H. Gascoigne, and T. Garnett, officials of the Trades and Labour Council, and P. Williams, the printer of the bulletin. A further writ for alleged libel and slander has been issued by Mr. Fearnley against C. J. Mitchell, B.Sc., of Woodhouse, Sheffield.

Institution Notes.

Institution of Electrical Engineers.—Summer Meeting Postponed.—It has been decided, on account of the recent general strike and in view of the situation in the coal-mining industry, to postpone the summer meeting which was to have taken place next month at the North-Eastern Centre until next year. It is hoped that the meeting will be held from June 14th to 17th, 1927.



Wireless Section Committee.—The under-mentioned gentlemen have been nominated by the Wireless Section Committee to serve on the Committee from October 1st, 1926:—*Chairman*: Prof. C. L. Fortescue. *Ordinary Members*: Major B. Binyon and Messrs. R. V. Hansford, S. R. Mullard, and G. Shearing. Not later than 14 days after the publication of the Committee's list of nominations, any five members of the Wireless Section may nominate any other duly qualified person to fill any vacancy. The following will continue to serve as members of the Committee: The President, I.E.E.; chairman of the Papers Committee, I.E.E.; a nominee of the Council, I.E.E.; a nominee of the General Purposes Committee, I.E.E.; Mr. P. R. Coursey; Prof. C. L. Fortescue; Capt. N. Lea; Mr. F. C. Phillips; Capt. H. J. Round; Mr. E. H. Shaughnessy; Commander J. A. Slee; and Mr. L. B. Turner, together with one representative each to be nominated by the Admiralty, Air Ministry, General Post Office, and War Office.

Iron and Steel Institute.—The postponed annual meeting of the above Institute is to take place on June 3rd and 4th at the Institution of Civil Engineers, Great George Street, London, S.W.1, when the programme already published will be adhered to as nearly as possible. The annual dinner, which may now necessarily be of an informal character, will take place at the Connaught Rooms, on June 3rd.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Mr. Harry P. Lawson, until lately a director of Messrs. Cole, Marchent & Morley, Ltd., has now accepted the position of sales manager to Messrs. Hick, Hargreaves & Co., Ltd., Soho Iron Works, Bolton. Mr. Lawson's long association with Messrs. Cole, Marchent & Morley, for whom he has acted as outside representative during the last fifteen years, has brought him into touch with municipal, company and indus-

Madame Yevonde] [*London.*

Mr. Harry P. Lawson.

trial engineers throughout the country and we feel sure that his many friends will join with us in wishing him every success in his new position.

Bedford Town Council is increasing the salary of the deputy electrical engineer, Mr. H. B. Jenkins, from £605 per annum to £625, from July 1st next.

In April, Mr. A. Maling, Australian manager of Metropolitan-Vickers Electrical Co., and Mrs. Maling, left Melbourne for Europe.

Obituary.—Mr. H. W. Bowden.—As briefly announced in our last issue, Mr Henry White Bowden passed away on May 9th. Mr. Bowden began his electrical career at Wolverhampton, where he was articled as a pupil with Messrs. Elwell Parker. Two years as electrical engineer with the Eastbourne Electric Light Co. followed and in 1891 he took up the position of assistant manager to the House-to-House Electric Light Co. at Kensington (now the Brompton and Kensington Electricity Supply Co.). He was prominently connected with that company's affairs for very many years, during a period of continuous extension. He became a director of the old Blackheath and Greenwich Electric Light Co. (now the South Metropolitan Electric Light & Power Co., Ltd), in 1898, and supervised the erection of much of the plant of the South Metropolitan Co., of which he was managing director and engineer-in-chief. In 1906 he also joined the board of the Woking Electric Supply Co. Mr. Bowden was one of the pioneers of electricity supply in London and in these days, when so much is being done to bring electrical service within the compass of the general populace, it is interesting to recall that he was very early in the field with free-wiring installation arrangements which gave the consumer up to six points free of charge. Mr. Bowden resigned his position as engineer-in-chief of the South Metropolitan Company in 1919, also his seat on the board, but he continued as consulting engineer to the company. He was a member of the Institution of Civil Engineers and of the Institution of Electrical Engineers.

Mr. F. S. Spiers.—We regret to announce that Mr. Frederick S. Spiers, O.B.E., B.Sc., A.C.G.I., A.M.I.E.E., died suddenly on May 21st, at the early age of 50. Mr. Spiers was a consulting electro-metallurgist in private practice, but was very widely known as one of the founders of the Faraday Society, of which he was secretary and editor up to the time of his death; in those capacities he rendered invaluable service to the electro-chemical industry. He organised the exhibitions of British scientific products which were promoted by the

British Science Guild in 1918 and 1919, and took part in the formation of the Electroplaters' and Depositors' Technical Society last year. The electro-deposition of metals was perhaps his most engrossing study, but he was keenly interested in all branches of physical science, and for many years was a regular contributor to our columns, besides being a personal friend of long standing, whose loss we deplore.

DR. J. T. BOTTOMLEY.—We regret to record that Dr. James Thomson Bottomley, D.Sc., LL.D., F.R.S., F.R.S.E., F.C.S., of Netherhall, Largs, Ayrshire, nephew of the late Lord Kelvin, passed away on May 18th, at 13, University Gardens, Glasgow, in his 82nd year. He was a native of Ireland, and after graduating with distinction in 1866, Mr. Bottomley successively occupied teaching posts at Queen's College, Belfast, King's College, London, and Glasgow University, where from 1869 to 1907 he was lecturer in Natural Philosophy and assistant to Lord Kelvin, with whom he was closely associated for many years. In 1900 he became a partner in the well-known firm of Kelvin, Bottomley & Baird, and on the death of Lord Kelvin in 1907 he became chairman of the company, occupying that position until his death. Mr. Bottomley's bent was towards physical research; he was a member of the Institution of Electrical Engineers and of the Physical Society, and was the author of various works on physics and mathematics. His gentle disposition endeared him to the students of Glasgow University during his long period of service as deputy to Lord Kelvin.

MR. A. J. COLLIER.—The death took place on May 18th, at Horton Chapel, Chartham, near Canterbury, of Mr. Alfred John Collier, of the Eastern Extension Telegraph Co. He was 76 years of age.

Mr. ALLAN DE LUCE, charge electrical engineer at the Colne electricity station, passed away last week at the age of 27 years. He had been in the service of the department 10 years.

MR. F. MACKENZIE.—The funeral took place, on May 20th, at Preston Cemetery, of Mr. Francis Mackenzie, for many years representative of the English Electric Co., Ltd., on the Royal Infirmary Mills and Workshops Committee and for 11 years a Workpeople's member on the board of management. Among the wreaths was one from the employés of the English Electric Co.

Wills.—MR. J. S. AGAR, of Agar, Cross & Co., Ltd., left £152,868.

The late Mr. H. OPPENHEIMER left £12,415.

The late Mr. W. R. COOPER left £15,451 gross and £13,883 net personalty.

The late Mr. THOMAS W. WARD, of Sheffield, left £485,627 gross and £467,853 net personalty.

Mr. G. C. KENT, chairman of Messrs. Taylor, Tunnicliff and Co., Ltd., left £39,443 gross and £32,679 net.

New Companies Registered.

Upfields Wireless, Ltd. (213,849).—Private company. Registered May 19th. Capital, £300 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in all kinds of wireless apparatus, receiving and transmitting sets, accumulators, component parts and wireless accessories, &c. The permanent directors are:—W. B. Alexander, The Kites Nest, St. Helen's Park Road, Hastings; R. Butler, 26, Baldslow Road, Hastings; B. H. Blackman, 23, St. Helen's Crescent, Hastings. Qualification, 20 shares. Secretary: B. H. Blackman. Solicitor: W. E. F. Cheesman, 23, Havelock Road, Hastings.

Shemelds, Ltd (N.I. 330).—Private company. Registered in Belfast May 7th. Capital, £3,000 in £1 shares. Objects:—To carry on the business of general electrical and telephonic engineers, motor engineers, plumbers, gasfitters, &c. The first directors are:—W. I. Smith, 33, Cherryvalley Gardens, Knock, Belfast, electrician; and J. H. Tyler, 33, Linden Gardens, Belfast, electrician. Registered office: Raleigh House, Queen Street, Belfast.

Northern Electric Supply Co., Ltd. (N.I. 331).—Private company. Registered in Belfast May 10th. Capital, £12,000 in 7,000 ordinary and 5,000 preference shares of £1 each. To produce, store and supply electric energy and power in any part of the United Kingdom, Colonies, Dependencies, &c. The subscribers (each with one share are):—J. H. Graham, 111, Beersbridge Road, Belfast, audit clerk; and H. McCorry, Aughacommon, Lurgan, solicitor's clerk. The first directors are not named. Qualification, 100 shares. Secretary: A. Heggarty. Registered office: 1, Wellington Place, Belfast.

Bergmann Electric Co. (Ireland), Ltd. (7,490).—Private company. Registered in Dublin on May 12th. Capital, £5,000 in £1 shares. Objects:—To carry on the business of electrical engineers and contractors, suppliers of electricity, &c. The directors are:—J. D. Doyle, Mountain Villa, Ballybrack, consulting engineer; H. N. Roberts, 26, Sandford Road, Dublin, consulting engineer; and J. W. Hissink, 63, Seestrasse, Berlin, Germany, engineer. Secretary: J. K. Reilly. Registered office: 4, Saint Andrew Street, Dublin.

Official Returns of Electrical Companies.

London Factors and Agents, Ltd.—A. Leonard, of 82, Victoria Street, S.W.1, was appointed receiver and manager on April 27th, 1926, under powers contained in charge dated February 28th, 1922.

Peter Curtis, Ltd. — S. W. Rowland, of 296-302, High Holborn, W.C.1, C.A., ceased to act as receiver or manager on May 11th, 1926. Satisfaction in full on May 11th, 1926, of debenture dated February 18th, 1925, securing all moneys due or to become due not exceeding £5,000.

Debenture charged on the company's undertaking and property, present and future, including uncalled capital, dated May 11th, 1926, to secure all moneys due or to become due from the company to Barclay's Bank, Ltd.

Paignton Electric Light and Power Co., Ltd. (98,437).—Capital, £40,000 in £1 shares. Return dated April 7th, 1926. All shares taken up. £40,000 paid. Mortgages and charges, nil.

Eddystone Components, Ltd.—Debenture dated April 23rd, 1926, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: A. Bird, 191, Preston New Road, Blackburn.

Neutron, Ltd.—Particulars filed of £3,300 debentures (including £1,300 already registered) authorised by resolutions of April 12th and May 4th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £1,900.

Breeden & Co., Ltd.—Debenture dated April 26th, 1926, to secure £15,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: British Brass Fittings, Ltd., 100, Moorsom Street, Birmingham.

Spensers (London), Ltd.—Particulars filed of £2,000 debentures authorised by resolutions of October 5th, 1925, and February 8th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £1,000.

Perfect Burglar Alarm Co., Ltd. (112,522).—Capital, £4,000 in 1,000 preference and 3,000 ordinary shares of £1 each. Return dated February 9th, 1926. 230 preference and 1,710 ordinary shares taken up. £1,382 10s. paid, being £1 on 1,210 and 15s. on 230. £500 considered as paid on 500 shares. Mortgages and charges, nil.

Sussex Electricity Supply Co., Ltd. (175,686).—Capital, £20,000 in £1 shares. Return dated December 18th, 1925 (filed May 15th 1926). 18,049 shares taken up. £18,049 paid. Mortgages and charges, £10,000.

Townlea Electrical Co., Ltd. (189,297).—Capital, £1,000 in 300 preference and 700 ordinary shares of £1 each. Return dated December 24th, 1925. 500 shares taken up. £500 paid. Mortgages and charges, nil.

Isle of Thanet Electric Supply Co., Ltd. (49,978).—Capital, £360,000 in 150,000 ordinary and 210,000 preference shares of £1 each. Annual return dated December 31st, 1925. All shares taken up. £150,000 paid on 150,000 preference. £210,000 considered as paid on 60,000 preference and 150,000 ordinary. Mortgages and charges, £298,616. Return of allotments, dated May 17th, 1926, shows a further 72,000 preference shares allotted, payable in cash.

City of Buenos Ayres Tramways Co. (1924), Ltd. (82,214).—Capital, £1,240,000 in £5 shares. Return dated March 1st, 1926. All shares taken up. £1,240,000 considered as paid. Mortgages and charges, £172,167.

Finston Manufacturing Co., Ltd.—Particulars filed of £1,500 debentures authorised May 14th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £1,000.

Northampton Electric Light and Power Co., Ltd. (28,640).—Capital, £350,000 in 10 "A" and 349,990 "B" shares of £1 each. Return dated March 4th, 1926. 10 "A," 304,723 "B" ordinary and 45,000 "B" preference shares taken up. £349,733 paid. Mortgages and charges, £200,000. In April, 1926, the capital was increased to £500,000 by the creation of 150,000 new shares of £1 each.

Telegraph Construction and Maintenance Co., Ltd. (1,147C).—Capital, £896,400 in £12 shares. Return dated March 11th, 1926. All shares taken up. £448,200 paid on 37,350. £448,200 considered as paid on 37,350. Mortgages and charges, nil.

Leamington and Warwick Electrical Co., Ltd. (13,780).—Capital, £100,000 in 2,500 preference and 7,500 ordinary shares of £10 each. Return dated February 26th, 1926. 1,100 preference and 6,800 ordinary shares taken up. £79,000 paid. Mortgages and charges, £35,000.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Callender's Cable and Construction Co., Ltd.

The report for the year ended December 31st last shows a balance to the credit of profit and loss of £368,644. After providing for debenture interest, preference dividends, depreciation and income tax, there remains a balance of £233,643, to which is added £462,695 brought forward, making £696,338. A dividend of 2s. per share is to be paid on the ordinary shares, making in the case of the old ordinary shares 3s., or 15 per cent., for the year, and £611,338 is to be carried forward. The company's business continued to expand and excellent results were obtained in its various departments. Keen competition was experienced and the profits on individual transactions were small. The substantial credit balance was due to economies in production, to the use of modern machinery, and to the great extent of the company's operations. The report says that there is every probability that large quantities of underground cable will be required in the near future, not only in Great Britain but also in countries in which a strong position has been secured; arrangements already made will enable the company to participate to the fullest extent in any such new business. The use of e.h.p. mains continues on an increasing scale, and the heavy expenditure incurred in providing plant and appliances for manufacturing these cables has been fully justified. The business in rubber wires and cables, which is a speciality of the Anchor Company, has made excellent progress during the year. Important contracts have been secured from abroad. A large order was placed for the Shanghai Tramways and the installation of the cables was carried out successfully by the company's engineers in spite of the disturbed state of the city. Notwithstanding the serious internal troubles in China, the company's business there still continues. The Okonite-Callender Cable Co., established in the United States, is now in successful operation and has secured many contracts for cables of the same type as those manufactured in England. The directors anticipate continued extension of this business in the United States. The directors of the company are of the opinion that the nominal capital should correspond more closely with the actual capital employed in the business. They therefore propose to increase the ordinary capital to £1,000,000 by the creation of 300,000 new shares. It is intended that 200,000 fully-paid ordinary shares should be distributed as a bonus from the reserves, each existing holder receiving one

new share for each three held. This will absorb the 100,000 shares already authorised but not yet issued and 100,000 of the new shares. There will then remain 200,000 shares to be issued as may be necessary in future. After this capitalisation the balance remaining to the credit of the reserve account will be £70,978. It is proposed to raise this to £400,000 by an allocation from the unappropriated balance at December 31st last, reducing the balance to be carried forward to £282,317. The necessary resolutions for these capital arrangements will be submitted at the annual meeting on June 3rd.

Siemens Bros. and Co., Ltd.

The report for 1925 records further improvement in all departments of the company's business and a substantially larger profit. The value of the unfulfilled orders at the close of the year was also greater. Steady progress was made during the year with the extensions of the Woolwich buildings and plant, and these are being brought into use as completed. The company has not yet reached a settlement with the Inland Revenue authorities in respect of its liability to excess profits duty. The profit for the year was £356,881, an increase of £90,583. After providing for debenture interest, &c., preference and interim ordinary dividends and income tax, there remains £176,112, from which is deducted a final dividend of 5 per cent. on the ordinary shares, making 7½ per cent. for the year (as in 1924), leaving £101,113. To this is added £195,027 brought forward, making £296,140, which it is proposed to carry forward. The report mentions the death of Mr. Francis Hird and the appointment of Dr. H. R. Wright as managing director; it also records the resignation of Mr. G. Chauvin and the appointment of Sir John Mann, K.B.E., to the vacancy on the board. The meeting is to be held on May 31st.

Shanghai Electric Construction Co., Ltd.

The profit for the year ended December 31st last was £72,159. To this is added £26,263 brought forward, less £20,000 transferred to renewals account, making £78,422. A further £20,000 is appropriated for renewals, £703 is transferred to reserve, £1,000 is provided for taxation, and £1,550 is contributed to staff provident fund, leaving £55,169. Interim dividends absorbed £30,000, and it is proposed to pay a final dividend of 4 per cent. (making 10 per cent. for the year), leaving £5,169 to be carried forward. The operating profit fell from £109,119 to £71,893, due to the disturbances in Shanghai, during which it was only possible to maintain a skeleton service. The trouble also delayed the putting into service of the new trolley omnibuses. Thirty-seven of these are now in operation, and the number is being gradually increased. The depreciation of the subsidiary coinage necessitated three fare increases during the year. For the current year the receipts compare very favourably with those for the first part of last year, and profits have been more than maintained. The special allocations for renewals have been necessitated by the heavy expenditure upon the general renewal of the permanent way, which is approaching completion. The newly-formed Singapore Traction Co., Ltd., is progressing with its conversion of the tramways to railless traction, and it is hoped to institute a service next month. The tramway earnings show a satisfactory tendency, but the lighting revenue, as was expected, has diminished. Meeting, June 2nd.

Anglo-Portuguese Telephone Co., Ltd.

The gross profit for the past year was £38,907. After providing for debenture interest, &c., and adding £5,804 brought forward, there remained £27,591. In view of the large sums required for development, the directors recommended that that amount should be carried forward, and they did not propose to pay a dividend.

The annual meeting of the company was held on May 17th. Viscount St. Davids, who presided, stated that although the company was not yet in the position which they hoped to attain, the situation was much better than it was a few years ago. They had earned a profit of £21,700 for the past year, but it was considered advisable to put the whole amount into the company's ordinary business rather than pay a dividend. Their telephone business was improving, and it was necessary to go forward or go under. They had been unable to raise new capital, but they hoped to improve the credit of the company to make that possible at no very distant date. The company's relations with the Portuguese Government remained good. The capital expenditure during the year amounted to £79,300, and they had opened new exchanges in Lisbon and Oporto; much, however, remained to be done, and unless new capital could be raised expenditure would have to be met out of revenue. The prospect for the current year was good, and the profit should, at least, be maintained.

Pernambuco Tramways and Power Co., Ltd.

The annual meeting was held on May 7th. Mr. W. Higgins, O.B.E., who presided, said that the expansion of the company's business continued. That was particularly marked in the tramway section in which traffic had compelled the company to undertake a comprehensive scheme of car building and conversion. The progress of Pernambuco also continued and among the recently-inaugurated improvements was the Boa Vigem line which the company was operating, sharing the profits with the State Government until the latter had recouped the cost incurred by it. It was hoped that the district served by this line would develop to important dimensions in the course of a few years. With regard to the lighting and power business, peak loads had risen to a point which demanded additional plant and the board had accordingly decided to order a new 6,000-kW set and the necessary accessories. The new unit would take the place of one of the old 1,000-kW sets and the plant would then have a capacity of 14,000 kW. The gas department also showed improvement and the business of the Telephone Co. of Pernambuco, Ltd., in which the company was interested held out good prospects. A new 50-year concession had been obtained and it was hoped to have the new automatic system in operation next year.

Swedish Ericsson Co.

The directors of the Allmänna Telefon Aktiebolaget L.M. Ericsson, report that the stock of orders almost doubled last year. At the beginning of 1925 they amounted to 6,550,000 kr. at the telephone factories and 1,040,000 kr. at the cable factory, and at the close of the year they were 14,010,000 kr. and 900,000 kr. respectively. The value of the deliveries from both departments reached 15,720,000 kr., as compared with 13,140,000 kr. in 1924. Out of this total the exports increased from 8,920,000 kr. in 1924 to 9,400,000 kr. last year, but the percentage to the total declined from 83.7 to 76.8 per cent. As the arrival of orders in 1926 has further expanded and represented a stock of 23,968,000 kr. on April 1st, the whole capacity of the works has been brought into use. Moreover, the company's subsidiary companies abroad have specialised in certain manufactures so as to complement the deliveries from Stockholm to foreign customers. The great development of the company and the possibilities of expansion abroad, the directors say, render it necessary to have recourse to the international money market to a greater extent than hitherto for the provision of capital, but a fundamental condition for this is that the balance sheet should be prepared in accordance with the principles practised abroad. In order to achieve this object it is considered that a further consolidation should take place and the directors therefore recommend that out of the profits of 2,042,000 kr., for 1925, the sum of 1,951,000 kr. should be devoted to this purpose and the balance carried forward. The net profits earned in 1924 amounted to 2,037,000 kr. The report further states that the activity of the foreign subsidiary companies proceeded on about the same level as in 1924, the economic results in general having been satisfactory.

Lancashire Electric Light and Power Co., Ltd.

Mr. G. Balfour, M.P. (chairman) presided at the annual meeting on May 14th, and in the course of his speech said that the business of the Lancashire Power Co. could be considered satisfactory. The Radcliffe station had been brought up to date, and the work at the Padiham station had proceeded, and it was hoped to commence supplying from the station in August this year. The cost per kWh delivered to the mains had been reduced from 0.275d. to 0.25d., while the total cost per kWh sold fell from 0.489d. to 0.483d. During the year considerable additions were made to the transmission and distribution systems. Notwithstanding the adverse trade conditions there had been a general expansion in business—except with regard to collieries. Further considerable capital expenditure was in prospect. Referring, in conclusion, to the Electricity (Supply) Bill, Mr. Balfour said that as it stood it was a thoroughly bad measure, and it could only be made to serve the interests of the public by drastic amendment.

Shropshire, Worcestershire and Staffordshire Electric Power Co.

Speaking at the annual meeting, which was held on May 18th, Mr. E. Garcke (chairman) said that distinct progress had been made, resulting in an increase of £38,000 in the profit. A further 15,000-kW set was being installed at the Stourport station, and the Treasury had agreed to provide a further £70,000 on similar terms to the original loan, but with a reduction in interest charges. After a long delay the Stourport station was now in a position to generate energy. The improvement had continued during the first part of the current year, but it had been somewhat retarded by the general strike. In this connection, Mr. Garcke said that not one of the employés had left the company during the emergency. Business was not growing very rapidly in the rural areas, but it was quite satisfactory, and the company had been successful in introducing electricity into many backward districts. Some of those areas were as much as 30 miles from the industrial centre of supply.

Lanarkshire Tramways Co.

The annual meeting was held on April 30th, Mr. A. R. Monks (chairman) presiding. In the course of his speech the chairman said that it was a matter of regret to the board that after presenting for 22 years annual accounts which had disclosed, after making adequate reserves, profits which had enabled the company to pay dividends averaging 6¼ per cent., they now had to submit accounts showing a heavy loss. Motor omnibus competition had shown a continuous increase. They had interviewed the Ministry of Transport and they understood that a Bill would shortly be promoted in Parliament which would enable local authorities to regulate and control motor services; until such steps were taken they proposed to restrict their activities and by exercising all practicable economies they hoped to ameliorate the position. They had recently negotiated a further loan to enable them to carry on until they were in a position to make a capital issue on satisfactory terms.

Calcutta Electric Supply Corporation, Ltd. In presenting the report and accounts (*vide* our last issue, p. 774) at the annual meeting on May 19th, the chairman, Lord Meston, said that the first mortgage debenture loan had been reduced by £430,000 owing to its conversion into ordinary shares. The value of fixed assets had risen by £320,000, due partly to the commencement of the construction of the new power station at the Calcutta Docks. The balance of the necessary funds for that station had been successfully raised by a share issue in the early part of the current year. A part of the proceeds of that issue was to be devoted to the reduction of the outstanding first debentures. The company's output in 1925 had risen by about 15 million kWh in spite of bad trade in Calcutta. The costs had remained practically stationary owing to the lower price of coal. The company's charges for electricity for industrial purposes had been reduced and it was anticipated that the rates for domestic supply would be lowered when the new station was in operation.

French Companies. The report of the *Compagnie des Forges et Ateliers de Constructions Electriques*, Jeumont, for 1925, shows a net profit of 8,834,000 fr., as compared with 5,993,000 fr. in 1924. It is proposed to pay a dividend at the rate 20 fr. per share as against 15 fr.

The *Société Gramme* reports net profits of 590,000 fr. for 1925 as compared with 568,000 fr. in the previous year; the rate of dividend is maintained at 60 fr. per share.

The *Compagnie du Chemin de Fer Metropolitain*, Paris, reports net profits and interest receipts amounting to 15,214,000 fr. for 1925, permitting of the payment of a dividend of 35 fr. gross per ordinary share.

The *Compagnie Electro-Mécanique* reports a net surplus of 1,530,000 fr., of which the sum of 1,210,000 fr. has been written off for depreciation and the balance carried forward.

The *Société des Magnetos R.B.* proposes to pay a dividend at the rate of 26 fr. per share for 1925, as compared with 42.30 fr. in the preceding year, on a larger share capital.

The *Société Parisienne pour l'Industrie des Chemins de Fer et des Tramways Electriques* records an increase in the net profits from 4,803,000 fr. to 5,168,000 fr., the dividend remaining at 16 fr. per share.

The *Compagnie Radio-Maritime* reports net profits of 2,093,000 fr. for 1925. A dividend of 22 fr. per share is again being paid.

The Société des Produits Chimiques et Electro-Métallurgiques Alais, Froges et Camargue (Pechiney), reports net profits of 24,853,000 fr., as against 17,473,000 fr. The dividend is raised from 8 to 10 per cent.

The *Société Indo-Chinoise d'Electricité*, of Paris, is increasing its capital from 11,900,000 fr. to 20 million fr.

German Companies. The *Mix and Genest Telephone and Telegraph Works Company*, Berlin, states that business in automatic telephone stations materially increased in 1925. Besides a number of private installations, exchanges for 17 towns were in hand and two already set in operation. On the other hand the Post Office orders for apparatus declined. The net profit was 605,000 marks, and the dividend is at the rate of 8 per cent.

The *Kortings Electricity Works Company*, Berlin, reports net profits of 187,000 marks in 1925, and proposes to pay a dividend of 8 per cent.

The *Voigt and Haeffner Company*, Frankfort-on-Main, again recommends a dividend at the rate of 8 per cent.

The *Duisburg Cable Works Company* is paying a dividend of 8 per cent. out of net profits of 653,000 marks, as compared with 6 per cent. in 1924.

The *Continental Company for Electrical Undertakings*, Nuremberg, records net profits of 488,000 marks for 1925, permitting of the payment of certain arrears on the preference capital and a dividend of 4 per cent. on the ordinary shares.

The report of the *Hartmann and Braun Company*, Frankfort-on-Main, states that the value of the turnover in 1925 increased, but satisfactory profits were not realised owing to higher production costs. The accounts show a net profit of 122,000 marks and the dividend on the ordinary shares remains at 5 per cent.

Chinese Company.—The *Société des Tramways et Eclairage Electrique de Shanghai* reports a profit of 22,540,151 fr. for the last financial year, as compared with 17,720,235 fr. in 1924. It is proposed to increase the capital of the concern from 30 to 40 million fr.

Marconi's Wireless Telegraph Co., Ltd.—The terms of the agreement with the Postmaster-General for a licence for the conduct of telegraph services between Great Britain and foreign countries provide that the company shall continue under British control, and in order that the articles of association can be altered to meet this requirement extraordinary general meetings are to be held on May 31st. Not more than 25 per cent. of the issued share capital of the company may at any one time be in foreign hands, and under the agreement the words "United Kingdom or India or any British Dominion, Colony or Dependency" cover the Irish Free State. It will be necessary in future for special forms of transfer to be used in order that a proper allocation of shareholdings can be made.

Cuba Submarine Telegraph Co., Ltd.—The report for 1925 records receipts of £63,404 and expenses amounting to £25,970. After providing for taxation and cable repairs there remains £25,350, to which are added £6,196 brought forward and £1,140 difference in exchange, making £32,686. The directors, after charging interim dividends and placing £10,795 to general reserve, recommend final dividends at the rate of 10 per cent. on the preference shares and at the rate of 5 per cent., free of tax, on the ordinary shares, leaving £7,892 to be carried forward. In spite of new competition the traffic derived from the West India and Panama Company's system was well maintained. Meeting: To-day (Friday).

Birmingham District Power and Traction Co., Ltd.—The annual meeting was held on May 19th under the chairmanship of Mr. C. Shirreff Hilton, who said that the accounts showed that the position of the company had again been strengthened. The dividend, the amount carried to reserve, and the balance brought forward had all increased. The difficulties engendered by motor-omnibus competition continued, and their subsidiary companies had had to adopt the policy of abandoning unremunerative tramway lines. The Birmingham and Midland Motor Omnibus Co., Ltd., continued to provide efficient services in an area of 2,000 sq. miles, and the Shropshire, Worcestershire and Staffordshire Electric Power Co. had again increased its ordinary dividend.

Great Northern Telegraph Co., Ltd., of Denmark.—The directors' report for 1925 shows that the net revenue decreased from £367,704 to £253,267. The addition of the balance brought forward makes £566,938 available for distribution. The total distribution for the year is 20 per cent., as compared with 22 per cent. in 1924. The reserve and renewal fund receives £19,444, bringing it up to £3,656,759, and £244,438 is carried forward. The lower revenue is attributed to the general commercial depression in Europe as well as to competition; Government-owned radio stations are particularly mentioned in the latter aspect.

Scottish General Transport Co., Ltd.—The revenue for 1925 was £28,718. From this are deducted administrative expenses, and allocation to renewals, and £11,302 is added from the previous accounts, leaving a disposable balance of £11,345, which the directors recommend should be carried forward. A dividend of 5 per cent. was paid for 1924. The report states that the lower profit is due to the failure of the Greenock and Port Glasgow Tramways Co. to pay a dividend. The capital expenditure during the year was £81,315, largely in connection with the company's omnibus services.

Aron Electricity Meter, Ltd.—The net profit for the year ended March 31st last, after providing for depreciation, taxation, &c., was £11,424 and the balance available, adding the amount brought forward, £14,548. As we have already reported, a dividend of 6 per cent. is to be paid on the ordinary shares. £3,000 is transferred to reserve and £2,942 carried forward. The meeting was to be held yesterday (Thursday).

West Kootenay Power and Light Co.—The profit for the past year amounted to $135,219, and to this is added $11,374 brought forward. $95,854 is transferred to sinking fund, the preferred dividends absorbed $35,000, and $16,609 is carried forward.

Submarine Cables Trust.—The report for the year ended April 15th last records a revenue of £30,264 and a balance (including £11 brought forward) of £28,529. The payment of coupons absorbs £3,258, £25,198 is transferred to the redemption fund, and £84 is carried forward.

Adelaide Electric Supply Co., Ltd.—The directors have authorised the payment of the dividend on the 8 per cent. preferred ordinary shares for the past half-year and an interim dividend of 6 per cent., free of tax, on the ordinary shares.

American Telephone and Telegraph Co.—Last week an issue was made of $154,000,000 of capital stock, bringing the company's capital up to $1,073,000,000, the highest ever reached by an American company.

Dorman, Long & Co., Ltd.—The directors have declared the interim dividend on the 6 per cent. cumulative preference shares, but do not propose to make any interim distribution on the 8 per cent. preferred ordinary or ordinary shares.

Commonwealth Edison Co.—The company reports a gross income for the past year of $16,805,144, and a net income of $10,766,786. Dividends absorb $7,202,942 and a balance of $3,563,844 is carried to surplus account.

Brush Electrical Engineering Co., Ltd.—The directors state that the issue of the report and accounts has been delayed. They recommended the payment of a dividend of 10 per cent. for the past year, as in 1924.

Stock Exchange Notice.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

American Telephone and Telegraph Co.—18,805 shares of $100 each.

British Columbia Electric Railway Co., Ltd.—Dividends of 4⅜ per cent., free of tax, have been declared on both the preferred and deferred ordinary stocks.

Northampton Electric Light and Power Co., Ltd.—The directors state that the issue of 70,000 ordinary "B" shares to existing shareholders at 27s. each has been fully subscribed.

West African Telegraph Co., Ltd.—The directors have declared a dividend at the rate of 4 per cent. free of tax, on the ordinary shares.

Dubilier Condenser Co. (1925), Ltd.—The directors recommend a dividend of 5 per cent. on the ordinary shares.

Stocks and Shares.

TUESDAY EVENING.

STOCK EXCHANGE markets recovered easily, in accordance with their reputation for elasticity, from the effects of the general strike. The deadlock in the coal trade exercised but a slight influence over prices except those in the coal, iron and steel group. In the latter, the continuance of the miners' deadlock is held likely to hasten the day when some of the iron and steel concerns will have to take in hand the reorganisation of their finances. Several of the companies are in a sound and a secure position, but others must reconstruct before they can hope to return to financial stability. The coal dispute has no effect upon electricity supply shares, several of whose prices stand higher on the week.

Home Railway stocks are, of course, moving very cautiously. Even in these, however, the tone is fairly firm, all things considered. Undergrounds are better. The lovely weather at Whitsun combined with restricted steam railway services to keep holiday-makers within a narrow radius from their homes, and drove people to 'buses and tubes as a means of escape into the fresh air. Therefore, on returning to business after the holiday, the Stock Exchange sang, with Empire Day fervour, the National Anthem and then proceeded to put up the prices of the various Underground issues.

British Columbia Electric Railway deferred and preferred are several points higher on the increased interim dividends of 4⅜ per cent. declared on both stocks. That the advances of 10s. per cent. had been anticipated, the readers of these notes will need no reminder. British Electric Traction is up 5, on the recent increase of 1 per cent., to 7 per cent., in the dividend. No changes have occurred in the London traction descriptions.

Brazilian Tractions rest within a couple of points of par; the level 100 is likely to be reached before long, if only by reason of the incessant demand for the shares on account of Canadian buyers. Mexican stocks are irregular.

The Shanghai Electric Construction Company has halved its previous dividend of 20 per cent. Profits at £72,100 were down by £32,500 owing to the disturbances, which began a year ago, at Shanghai. Normal traffic conditions were restored at the end of the year. The report states that the traffic returns in the current year are the largest hitherto recorded.

Cable and electrical construction shares are a very lively market. Siemens have been fluctuating sharply. The eagerly-awaited dividend is 5 per cent., making 7½ per cent. for the year, and showing no change. The directors speak well of the progress made in the company's business, with the exception of the foreign branch, which, they say, is not yet satisfactory. Questions relating to E.P.D. are still unsettled with the Inland Revenue; agreement is expected very shortly. The price of the shares touched 32s., to revert to 30s. 6d. upon slight disappointment with the dividend.

Callender's are a good market at 4. The profits shown by the report are £12,000 up at £289,644; the dividend goes on as before at 15 per cent., and £200,000 is to be capitalised from the reserve fund for distribution as a bonus amongst the shareholders. Henley's are 3½, anticipation going for a "banner" report. Most of the other members of this group are better on the week. Rises have taken place in British Aluminium, British Insulated, Edison 5 per cent. debenture, Brush, Electric Constructions, General Electrics, Enfield ordinary, and Johnson & Phillips. A further jump in Babcocks lifted the price 3s. to 52s. Considerable business is being done in this department.

Electricity Supply shares are steady, County ordinary providing the main feature, with a rise to 59s. Charing Cross ordinary gained 1/16 at 45s. 9d. The other fluctuations are smaller. Dealers in this market are large buyers of the best-class debenture stocks. London Power 5 per cent. debenture has strengthened to 97, which is 1 premium above the issue price. A full six months' interest becomes payable in October.

In spite of the ever-growing inquiry for good industrials—capital must seek employment in Stock Exchange securities if trade is too stagnant to absorb it—cable issues are somewhat neglected. Prices in the Eastern quartette remain steady, but are practically unchanged, nor have they moved to any quotable extent during the excitements of this month. The Cuba Submarine Telegraph has declared its regular dividend of 5 per cent. tax free, and the shares are about 6¾ middle. Great Northerns weakened on the reduction of 2 per cent., to 20 per cent., in the dividend, and Indo-Europeans are ex 37s. 6d. dividend, at 45½. An extraordinary meeting of the Marconi's Wireless Telegraph Company will be held next Monday in order to alter the articles of association. Negotiations with the Postmaster-General for a licence for the conduct of telegraph service between Great Britain and foreign countries have been brought to a satisfactory conclusion. Not more than 25 per cent. of the company's capital may be held in foreign hands, and special forms of transfer-deeds will be required to ensure this end. The Egyptian Government has granted the company a thirty-year concession.

The Ruths Steam Accumulator.

An Interesting Development with Important Possibilities.

By ALFRED J. T. TAYLOR.

(Abstract of Paper read before the INSTITUTION OF ENGINEERS AND SHIPBUILDERS IN SCOTLAND.)

AT the Wembley World Power Conference, Dr. Johannes Ruths presented a paper on his steam accumulator, the importance of which was referred to in six other World Power Conference papers by European engineers. The system designed by Dr. Ruths had, up to that time, been the subject of over 200 technical articles in foreign languages, and been applied beneficially in 17 distinct lines of manufacture. The accumulator had been definitely out of the experimental stage for over four years, yet in July, 1924, there was only one Ruths accumulator in the British Empire and only two others in the rest of the English-speaking world. Not a single technical paper in the English language had dealt comprehensively with Dr. Ruths' inventions, which I believe to be the most far-reaching in the field of industrial steam engineering during the past 15 years.

English-speaking engineers, familiar with the limitations of prior developments of steam storage, have felt until recently that the work being done in Scandinavia and on the Continent along these lines was but a variant of work previously done here, and, therefore, suffered from similar limitations. It is partly as a result of this attitude that the entire English-speaking world has been about three years late in grasping the significance of the Ruths system, which has already been applied in more than 200 industrial plants.

The effect that variations in the consumption of steam, or power, exercise on the working methods and overall efficiency of our industrial plants, often much greater than is generally known, has been accepted as unavoidable; and attempts have been made to counteract their effects by providing greater flexibility in the firing apparatus.

All firing equipment has a certain time lag in responding to changes in load conditions, and during this period the operating efficiency falls off. There is one definite point in the output of steam for each boiler when the overall efficiency of the unit is at the maximum.

The Ruths accumulator is based on the principle of storing in a large quantity of water under pressure and at saturation temperature the heat energy of steam, and releasing this energy in the form of steam under decreasing pressure. It will accommodate wide fluctuations in steam demand over periods of hours if necessary, and is, in fact, the flywheel of the boiler plant. For example, if a pressure of 400 lb. in a boiler is lowered to, say, 350 lb., 0.8 lb. of steam will be obtained from each cubic foot of water. The accumulator can be arranged to work at much lower pressures, say, between 60 and 10 lb.; for this pressure range the storage capacity is 4.2 lb. of steam per cubic foot of water. Thus, for the same pressure drop of 50 lb. the storage capacity of the accumulator may be five times larger than in the modern boiler for the same quantity of water. In addition, the boiler in this example has to be built to withstand 400 lb. pressure, but the accumulator only 60 lb. Steam storage capacity in an accumulator can, therefore, be obtained much more cheaply than in a boiler, which should be built only for the purpose of generating steam at a constant rate, and all superfluous water space should be arranged for in a separate receptacle, built for a lower pressure, in which much wider pressure fluctuations may be allowed than in the boiler. It is significant that Dr. Frederick Münzinger in his paper before the World Power Conference on "High-Pressure Boilers" writes:—"One can see, according to our present knowledge, that in many cases the economical use of high-pressure steam in stations with high peaks could probably only be made possible by the installation of such accumulators."

The accumulator is built in the form of a cylindrical steel tank with hemispherical ends. Its volume is so large in comparison with its exterior surface that insulation 3 to 4 inches in thickness is sufficient to reduce the heat loss to a negligible amount. It is usually installed in the open air and consists of two parts: the accumulator proper and the automatic valves which control the co-operation of the boilers and the accumulator, and also govern the steam distribution throughout the whole works (fig. 1). The tank A is filled about 90 per cent. full of water. Over this is a covering B of non-conducting material, with insulation blocks C covering the riveted seams of the shell, easily removable for the inspection of the seams; this lagging is protected by a light sheet-iron cover D. The non-return valve E admits charging steam to the internal steam-distribution pipe F and the charging nozzles G, which are equipped with circulation pipes H to ensure uniform and noiseless heating of the water. Through a non-return valve I the discharge of steam takes place; a de Laval nozzle K limits (in case of emergency, such as a rupture in the steam piping) the maximum discharge of steam from the accumulator to an amount which will not allow priming. A water column L and feed valves M are provided for reading and adjusting the water level in the accumulator.

Condensation of steam in the accumulator, due to radiation losses, tends to increase the average water level, but the fact that the accumulator is charged with steam of higher pressure and higher heat content and discharges steam at lower pressure, *i.e.*, that it is consequently discharging more steam than it is taking in, counterbalances the condensation so well that a readjustment of the water level is seldom required.

The capacity of an accumulator for a given plant is determined by the magnitude of the fluctuations of the steam consumption only, and not by the capacity of the boiler plant. Suppose the accumulator is connected between two pipe lines carrying pressures of 150 and 50 lb. per square inch respectively; one cubic foot of water can store 4.2 lb. of steam; therefore, if a storage capacity of 25,000 lb. of steam is desired, and 90 per cent. of the accumulator volume is occupied by water, the volume of the accumulator will be $25{,}000/4.2 \times 0.9 = 6{,}613$ cu. ft. Steam accumulators have been built in sizes of from 200 to 13,000 cu. ft. volume, and one mill installation has a total volume of 37,000 cu. ft. with a capacity of 150,000 lb. of steam; it is sub-divided into three separate tanks. The total volume of all Ruths accumulators now in operation, or under erection, is 960,000 cu. ft., with a total capacity of about 3,700,000 lb. of steam and a water weight of about 56 000,000 lb.

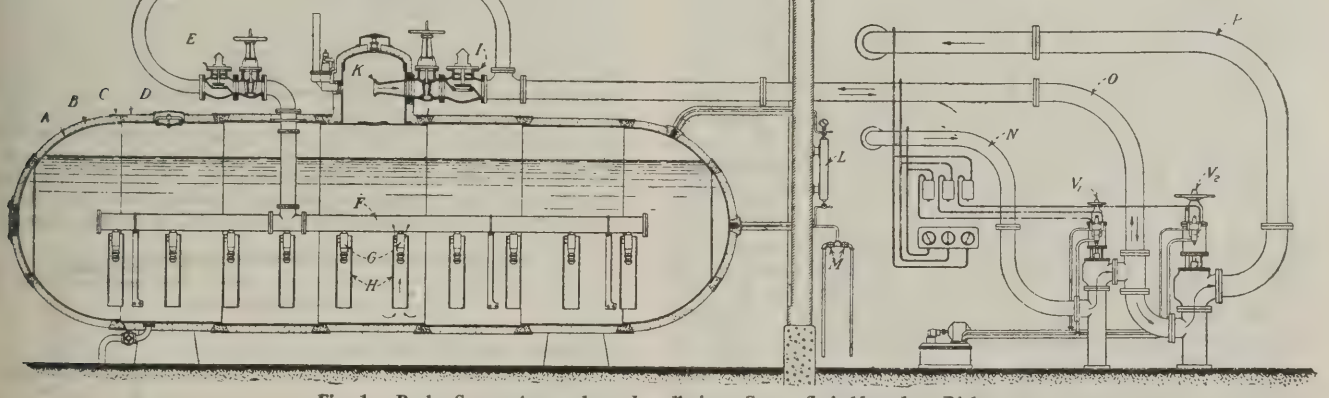

Fig. 1.—Ruths Steam Accumulator Installation; Steam Switchboard on Right.

Of the greatest importance for the proper functioning of the system is the regulating equipment (the steam switchboard). The accumulator must be connected between high- and low-pressure steam lines, and the pressure in the steam header is always kept constant; the accumulator pressure only is allowed to vary. Steam is generated in the boiler house at, for instance, 150 lb. per sq. in. pressure, and reduced by valve RV to 25 lb., fig. 2. Due to a fluctuating steam demand, the boiler pressure cannot be kept constant; Ruths' theory was to insert an overflow valve OV, which only passes enough steam to maintain a constant pressure in the boiler. In most cases, however, the steam supply through OV and the steam demand through RV are not always equal, and there is a difference in time between them; therefore, an accumulator has to be inserted between OV and RV capable of storing enough steam to maintain the balance. If the pressure in the accumulator drops to 25 lb. and there is still demand for

steam in excess of the supply from the boilers, the low pressure will drop below 25 lb. To prevent this, a reducing valve RV is connected in parallel with OV, to by-pass sufficient steam to maintain the low pressure regardless of the condition of OV. Often the accumulator is built for a lower pressure than that of the boiler (for instance, for 125 lb.), in which case a valve MV is required to protect the accumulator from being overcharged, and by using these four valves an absolute balance and constant pressure are maintained, except under extreme conditions beyond the range for which the particular plant has been designed.

In practice the arrangement has been improved by combining in a single valve all the functions of valves OV, RV, and MV. In fig. 1, valve V_1 is connected to the boiler main N, and is controlled by the boiler pressure in such a way as to maintain it constant; that is, the valve acts as an overflow for the boiler, being set for a pressure slightly lower than the safety valves. The popping of the safety valves on the boilers will always be prevented, and when steam is generated in excess of the pressure for which the valve is adjusted it will automatically pass through this valve into the accumulator

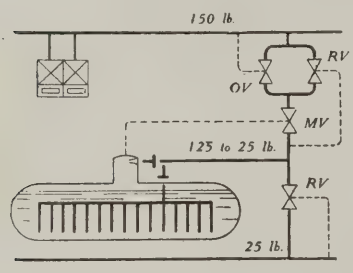

Fig. 2.—System of Automatic Valve Control.

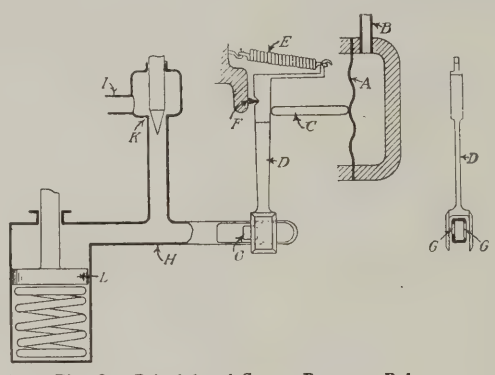

Fig. 3.—Principle of Steam Pressure Relay.

line O. A reducing valve V_2 maintains a constant pressure in line P leading to the steam consumers. According to whether at a given moment more or less steam is passed through valve V_1 than through valve V_2, the accumulator will be charged or discharged. If the accumulator should happen to be charged up to its maximum pressure, V_1 will shut off further steam supply to the accumulator; if the accumulator should happen to be completely discharged, V_1 will secure a sufficient supply of steam to the secondary steam line P, despite the fact that the accumulator is discharged.

Correct co-operation of the different functions of these control valves depends on extremely sensitive pressure regulation, and the principle of the relay developed is shown in fig. 3. The motion of the steel diaphragm A, which is exposed to the steam pressure admitted through pipe B, is transmitted by rod C to the lever D, which is held by spring E against edge F. The lower fork-shaped end of lever D covers, more or less, two opposite orifices G in the oil pipe H. Oil is supplied by a small motor-driven pump under constant pressure through pipe I, and is throttled at K. A small movement of A is magnified about 50 times by D; this changes the size of the two orifices G, and hence the pressure in H, resulting in a certain movement of the spring-loaded piston L which is used to control, by means of a pilot valve, the supply of pressure oil to a servo-motor actuating the regulating valve, which is equipped also with the return motion required for stability of regulation. These valves can be adjusted to regulate any steam pressure, and to keep it constant within a range of less than one pound. The time required for opening and closing may be regulated between one-fifth of a second and 60 seconds. Further, these valves may be closed instantaneously by relieving the oil pressure and then operating the hand wheel on the top of the valve. All moving parts work in a closed oil system, so that wear and need for attendance are practically negligible.

The most important advantage, and the one most difficult to appraise, is the beneficial effect of the system upon the quantity and quality of production. Just as constant voltage is an indispensable requirement in an electrical system, so constant steam-pressure and temperature are indispensable for uninterrupted production and uniform quality in the goods produced. The fact that boiler efficiency during actual operation never equals test results has been confirmed by an increased efficiency in plant equipped with accumulators; the boilers may operate continuously under the most favourable test conditions, and savings in fuel of from 10 to 30 per cent. have been made. Forcing the boilers will be avoided, brickwork and boiler will be kept at an even temperature and relieved of the constant expansion and contraction which acompany a fluctuating load, which will reduce the upkeep cost.

Since the operation of the accumulator installation is entirely automatic, and the operation of the boiler house and power plant is greatly simplified, a saving in labour operation costs will result. Both the capital and operating costs of a new steam-power plant will be considerably reduced, and if an accumulator is installed in an existing plant other savings will pay for the installation in a short time.

Typical installations may be mentioned to indicate some of the advantages of installing a steam accumulator: In the case of a textile mill, the shortening of the time necessary to heat the dyeing kettles resulted in an increased output of not less than 10 per cent.; also the quality of the product was improved, and it was possible to increase the output of the steam engines from 650 to 800 kW, which meant a reduction in purchased power of 150 kW.

The influence of an accumulator on the size and capacity of the boiler plant and on the generation of power from process steam is shown in the case of a cane-sugar refinery: The provision of a 700-h.p. boiler to cope with the peak loads was obviated, and the cost thus saved will pay for the entire accumulator system; the insufficiency of process steam at times and an excess at other times are obviated, thus giving the turbines a constant supply. The saving, as compared with hydro-electric power previously used, amounts to £16,000 per year, and the cost of generating power by process steam amounts to only 6 per cent. of the total fuel cost, plus depreciation and upkeep of the necessary equipment.

In the case of industries which chiefly consume steam, using little or none for process work, such as iron and steel works, the accumulator has to store steam and deliver it to the turbines at peak times, but it is dry saturated steam, whereas it is desirable that it should be superheated. Therefore, another accumulator is added for storing superheat, working on the same principle as the well-known Siemens regenerative heater.

The following example shows how an accumulator system can be designed to suit the most diverse requirements:—The municipal electric power plant at Malmö, Sweden, purchases hydro-electric power which is delivered over a long transmission line. Due to frequent disturbances, a stand-by was required capable of carrying at least the electric load for lighting and street railways. For this purpose a large lead storage battery was installed originally, and some of the boilers in the steam plant were always kept under pressure. So as to save the cost of keeping the boilers under pressure, a Ruths steam accumulator was installed, as shown diagrammatically in fig. 4.

Two accumulators of 8,000 cubic feet volume each, with a capacity (together) of 80,000 lb. of steam, on a pressure drop of from 114 to 28 lb. per sq. in., are kept under pressure, the cooling losses being taken care of by a small electric boiler. Further, a specially designed condensing steam turbo-generator of 3,750 kW has been installed. The generator end of this set normally runs as a synchronous condenser, but as soon as a break occurs in the supply of hydro-electric power, the speed governor on the turbine opens valve V_2, admitting steam from the accumulator to the turbine. The load will thus be instantly carried by the turbine, and no disturbances will be felt in the supply of electrical energy for lighting and street cars. In order to maintain the highest efficiency on the turbine, the steam from the accumulator is passed through the first stage until the pressure drops to 67 lb. per sq. in., at which pressure

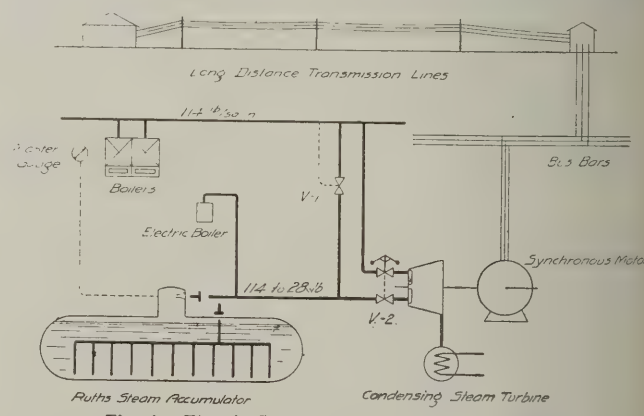

Fig. 4.—Electric Stand-by Plant at Malmö, Sweden.

the steam is by-passed the first stage, and enters the second stage direct until the pressure drops to 42 lb., when it enters the low-pressure stage direct. The accumulator installation is big enough to furnish steam to the turbine for one hour, developing about 3,000 kW, which is sufficient time for the boilers to be started; as soon as the pressure has been raised, the boilers will supply the turbine until the hydro-electric supply is restored, when the boilers recharge the accumulator through valve V_1 and are then shut down again. The installation has been so successful that another municipal power station in Sweden has built a plant of the same type, and other authorities contemplate similar stand-by arrangements.

We know how to produce cheap steam; coal is being burned in powdered form with a monthly efficiency of 92 per cent. The next step will be the carbonisation of coal before it is burned, but it is not sufficient merely to produce cheap steam, for it is in economy in the use of steam after it is produced that the greatest savings in industry will be effected. This is the largest field for the accumulator, and its development is intimately bound up with the study of exhaust steam engineering.

The paper concludes with a bibliography of the subject and a detailed list of the 217 accumulator installations that have been ordered since 1916. The largest has a steam capacity of 100,600 lb. and the smallest 77 lb., most of which are, or will be, used in Europe. There are four installations in Canada, three in Scotland, and one each in Newfoundland, the U.S.A., and Brazil. Practically all industries are using accumulators, in addition to such establishments as a hospital, a university, printing offices, &c., and the ten installations ordered for use in electric power stations will have a total steam capacity of 628,500 lb.

Empire Wireless Communication.

An Outline of the Progress Achieved Since the War.

By W. H. ECCLES, D.Sc., F.R.S., M.R.I., M.I.E.E.

(*Abstract of discourse before the* ROYAL INSTITUTION OF GREAT BRITAIN.)

THE British Empire is a medley of fragments spread as if by blind chance over the habitable portions of the globe. For so dispersed a family the problem of telegraphic communication is important and difficult. Quite early in the development of wireless telegraphy the principal nations began to regulate its employment. Indeed, control was compelled, in the armed camp that Europe then was, by the consideration that, when war came, wireless would be useful to fleets and armies and dangerous in the hands of spies. In peace time even some degree of control was called for to reduce interference, especially between powerful long-range stations. Each such station ought, in fact, to transmit on a different wavelength from other stations; and once a wavelength is assigned to a particular long-range station, it should not be given to any other. In other words, the grant of a wavelength to a powerful station is equivalent to giving a right-of-way to that station. For all these reasons the Imperial Conference of 1911 declared that wireless communication within the Empire should always be regulated with especial care, and that, in the main, the necessary stations should be State-owned and State-operated.

In contrast with our inaction, the United States pressed on with the construction of several large Government stations, and France and Germany made great progress with their respective Colonial plans.

Germany had made great strides with her Colonial communications between 1912 and 1914. She had established thoroughly modern stations in Togoland, in German East Africa, in German South-West Africa, and in the Pacific. The three African stations could intercommunicate with one another, and, to a limited extent, with the great station at Nauen, near Berlin; the Pacific station was at Yap in the Caroline Islands. It was a noteworthy coincidence that all these stations were completed just before the war began. I remember hearing the early trial signals from Yap while I was sailing across the Pacific in July, 1914, and it may be of interest to recall the fate of the station, which I remember because I was called from Sydney to Melbourne by the Australian Government to help in an advisory way with an interesting application of wireless. At that time the German fleet was cruising to the north of Australia and was in nightly touch with Yap. As soon as this was observed each of the small shore stations along the Australian coast was instructed to listen for the signals of the German fleet, to record the strength with which the signals were received, and to report daily to Melbourne. From the reports, by a process resembling triangulation, an estimate was made in Melbourne of the changes of position of the German fleet. Meanwhile an Australian naval force left Sydney with the object of destroying the wireless station at Yap, which was duly accomplished, and for days afterwards the German fleet, unaware of the disaster, continued to call the dead station, in vain. The continued calls, by helping us to keep track of the fleet, eased the anxiety of those who knew that the New Zealand expedition was then well on its way to capture Samoa.

The war closed without any progress in Imperial wireless; the Governments of the British Empire, at the close of the war, possessed only one large station among them—that at Windhuk in German South-West Africa—captured by the forces of the Union of South Africa under General Smuts. Thus at the end of 1918 the Empire was far behind most other great Powers as regards Government-owned stations, and, by the way, equally far behind as regards powerful commercial stations.

Within a year of the conclusion of the war, Lord Milner appointed a Committee, under the chairmanship of Sir Henry Norman, to investigate afresh the problem of establishing a comprehensive wireless network. The Committee's report was, clearly, somewhat ahead of its time, but not, I think, too far ahead, for only five years later the Post Office station at Rugby* has been built with thermionic valves yielding double the output recommended by the Committee. The Rugby station, besides, has shown what the Norman Committee's stations could have done. The station is full of novel features, and includes apparatus for transatlantic telephony.

* See ELEC. REV., April 23rd, 1926.

The ultimate aim of this experiment is to connect any telephone subscriber in this country to any subscriber in the United States and Canada. By aid of the telephone circuits already constructed between England and the Continent it may be found possible later to connect anyone in Western Europe to anyone in North America through Rugby. The Rugby station when in full swing will probably be able to transmit simultaneously three long-distance telegrams and a telephone message.

When one realises that this multiple service station has cost only about half what the single service station near Bordeaux (France) cost in 1919, one appreciates the great strides that wireless design has made during the past few years. Rugby, in fact, has cost about £400,000, much less than even the new stations at St. Assise, near Paris, and on Long Island, near New York. Further, as the Leafield station began to earn within a year of its opening more than covered its working expenses, so we may reasonably look forward to the Rugby station soon becoming a profit-earning concern.

The telegraphic traffic to and from the centre of the Empire will be greater than that to and from any of the Dominions, for the spokes all meet at the hub of the wheel. Therefore Britain must make much greater provision than even the largest Dominion, perhaps tenfold. The English "beam" stations for communicating with four Dominions will cost altogether about half as much as Rugby. For this expenditure good communication is guaranteed for a daily average of 18 hours with Canada, 7 hours with Australia, 11 hours with South Africa, and 12 hours with India. We only know enough so say that both systems will be useful, and that each can do something the other cannot.

Before the end of this year the long-range wireless transmitting equipment of the Empire will include—

(1) The multiple station at Rugby, comprising:—
  (*a*) Long-wave plant of world-wide range.
  (*b*) Long-wave plant of medium range.
  (*c*) Short-wave plant of world-wide range.
  (*d*) An experimental telephony plant of range 4,000 miles.
(2) Medium-power stations for long and short waves at Leafield (Oxfordshire) and at Abu Zabal (Egypt).
(3) Four "beam" circuits for communication between England and the four largest Dominions.

Thus the Empire will shortly possess the most up-to-date wireless equipment in the world, and preparations ought to be made to utilise fully the new facilities. For instance, twice a day Rugby transmits a summary of news prepared by the Foreign Office, and conceivably other news services may be arranged. If I were a settler in Uganda, or the owner of a remote sheep station in Australia, I should install a simple receiving set and so keep in touch with the world, but this implies learning the Morse code, and therefore in small communities where there is a local news sheet it would be more practical to organise a receiving service by paying an operator to listen regularly and decode the messages for the printer. In the Empire there are innumerable remote settlements to which the cabled news messages leak very slowly, and there are many which depend entirely for their news on the occasional visit of a ship. All such outposts can now, by aid of a simple receiving set, be made to feel that they are within five minutes of Fleet Street. Moreover, if these stations were registered messages could be specially addressed to them from England just as telegrams are going from Rugby to-day to ships on distant oceans.

Another method of distributing the Morse messages from home when received, say, in New Zealand, is to announce them, after decoding, through the local broadcasting stations. I refrain from prophecy, and am now speaking of what can certainly be accomplished to-day by mere organisation of existing facilities.

A Hydro-Electric Governor.—Some particulars are given in the *Imperial Industrial Review* of the Cox-Walker hydro-electric governor produced by Messrs. Cox-Walker & Partners. The operating element of this apparatus consists of a special balanced beam (used with the Taylor Scotson pressure regulator) maintained in a horizontal position by means of pilot solenoids, adjusted to the desired voltage. The slightest movement of the beam due to voltage variation closes special non-sparking contacts (provided on each side of the solenoids), which also close in turn one of two relays and the circuit of a small motor. The motor starts up in a direction depending on which relay is operated, and brings into action a series of contacts which cut in or out a number of resistance units, thus adding or deducting artificial load as the actual load varies. The beam is claimed to be sufficiently sensitive to maintain a pressure accuracy of 1 per cent., although in order to limit the number of contacts required, 2½ per cent. is the figure usually adopted. The artificial load may, of course, be put to some useful purpose. A suggestion is that the load be used for central heating, a suitable heater being designed with a number of elements which may be cut in or out. The system also includes a device which, in the event of a sudden drop of load, for instance, a break in a loaded transmission line, trips the breakers and short-circuits the generators' fields. An equipment of this description controls the hydro-electric supply of the Coniston Electric Light Co., Lake District, no mechanical governor being provided on the 40-h.p. Pelton-wheel turbine.

The Electricity (Supply) Bill.

The Proceedings in Committee.

(*Continued from page* 760.)

On May 18th Standing Committee C of the House of Commons resumed consideration of the Electricity (Supply) Bill. Sir Robert Sanders presided.

Discussion was continued on Clause 1, which proposes the constitution of a Central Electricity Board, consisting of a chairman and seven other members appointed by the Minister of Transport.

Mr. G. Balfour (Hampstead, U.) moved an amendment to provide for the appointment of the Board by "the Lord Chancellor, after consultation with the Association of British Chambers of Commerce, the Association of Municipal Corporations, the Incorporated Association of Electric Power Companies, and the Provincial Electric Supply Committee," instead of by the Minister of Transport. Mr. Balfour said that this form of words would ensure the appointment of an absolutely impartial body, free from any taint of being influenced by the companies, corporations, or any particular manufacturing or trade interest.

Sir D. Hogg, the Attorney-General, in resisting the amendment, said that the Government could not agree to the appointment of the Board by the Lord Chancellor instead of the Minister of Transport. Under the 1919 Act electricity was specifically assigned to the Minister of Transport as his particular subject. The appointment of such a Board had nothing whatever to do with the Lord Chancellor. The list of bodies mentioned with regard to consultation was not the most exhaustive that might be chosen. He imagined that Labour would want to be consulted in the matter. There was an amendment, standing in the name of Sir Philip Dawson and Mr. Hannon, to provide that the Board should be appointed by the Minister of Transport after consultation with representatives of local government, electricity, commerce, industry, transport and labour. When that amendment was reached he proposed to ask the Committee to accept it. The Government agreed that it would be helpful that there should be some sort of consultation before the appointment of the Board.

Mr. Hardie (Glasgow, Springburn, Lab.), in opposing the amendment, alleged that its proposals showed that Mr. Balfour and his friends were not caring so much for the national interests as that certain private interests should be represented on the Board. He feared that the technical side of the Board would be subordinated to the commercial side.

Sir Philip Dawson (Lewisham, W., U.) said that under the amendment, somebody who knew nothing at all about electricity would be the person to appoint the members of this most important Board. If this Board were purely a judicial body, if it were a court of arbitration which he understood the Attorney-General had said would be appointed with regard to appeals, then he could understand the suggestion that the Lord Chancellor should make these appointments. But the Bill was intended to improve the very bad conditions of electricity supply in this country, and if those conditions were to be improved then those who knew most about the supply of electricity and who had devoted a great deal of time and trouble to it, that was to say, the Minister of Transport should have the appointment of the gentlemen who would form the administrative body. For that reason, he thought the suggestion that the Lord Chancellor should appoint the Board was not satisfactory. It was quite untrue to say that the Electricity Commissioners had been the creatures of the Minister of Transport.

Major Glyn (Abingdon, U.), who also opposed the amendment, caused much laughter by declaring that Mr. Balfour did not appear to trouble whether the Archbishop of Canterbury or the Chief Rabbi appointed the Board, so long as the Minister of Transport did not make the appointment.

Eventually Mr. Balfour's amendment was withdrawn.

Sir Philip Dawson's amendment, providing that the Minister of Transport should appoint the Board "after consultation with such representatives or bodies representative of the following interests as the Minister thinks fit, that is to say, local government, electricity, commerce, industry, transport and labour," was then considered.

Mr. A. Hopkinson (Mossley, Ind.) appealed to the Committee to do away with "eye-wash about Labour," who were the least capable of running such a Board, and who knew nothing about the matter. This view, however, was not shared by the other members of the Committee.

Sir D. Newton (Cambridge, U.) was anxious as to whether the adoption of the amendment would ensure adequate representation for the municipal corporations. He pointed out that the evidence given before the Weir Committee showed that 248 generating stations were owned by local authorities, as were 278 authorised undertakings to supply power. Local authorities had no less capital than £103,000,000 invested in the electricity business.

Mr. Looker (Essex, S.E., U.) asked whether the Minister of Transport would consult representatives of the gas companies in the appointment of members of the Board? Representations had been made to him from gas interests in his constituency. There could be no doubt that the gas companies had rendered inestimable services to the community in the past, and they were apprehensive that those services might be affected by the provisions of the Bill. The gas interests were capable of giving extremely valuable co-operation and assistance; they were not opposed to the Bill, but were only too anxious to co-operate and assist.

Col. Ashley, the Minister of Transport, said that he had already on several occasions had interviews with and communications from the representatives of the gas industry, and he had found them very reasonable and not disinclined to help. In the amendment the words "commerce and industry" were included, and that would enable him to consult with the representatives of the gas industry. He certainly would consult with those representatives.

Mr. Lamb (Stone, U.) hoped that the interests of agriculture would not be neglected. Agriculture was vitally interested in the Bill. Agriculturists would become large consumers of electricity, and the main transmission lines would have to be laid largely over agricultural property.

Col. Ashley said that he could consult with anybody; the amendment did not exclude that; it simply said that he should consult with certain interests.

Mr. Clayton (Widnes, U.) feared that the amendment would lead to the appointment of delegates from the various interests consulted. It would be much better to leave the Minister free to consult whom he liked.

Mr. E. Harmsworth (Thanet, U.) also feared that the Board might become a debating society, incapable of executive action.

The amendment was, however, carried.

Mr. A. Alexander (Sheffield, Hillsborough, Lab.) moved:—"A person shall be disqualified from being appointed or being chairman or a member of the Board, if he has, directly or indirectly, any share or interest in any undertaking for the supply of electricity, or any undertaking for the manufacture or sale of machinery, or plant, or materials for the generation or transmission of electricity, other than as a ratepayer in the case of an undertaking of a local authority." He explained that his object was to obtain absolutely impartial treatment by the Board.

Col. Ashley said that the Government could not accept the amendment, which would introduce a very new and very undesirable feature in our public life. If one could not trust gentlemen of distinction, members of the Board, to carry on the commercial activities of that Board without partiality simply because they might have a few hundred pounds invested in some electricity undertaking, then one had better put up the shutters on the old country.

In the discussion which followed, Sir G. Hume (Greenwich, U.) said that the men to be appointed on the Board would be those who were in close contact, either commercial or industrial, with electricity. If the amendment were drawn on the lines that, a member having been appointed, should dissociate himself from anything that would affect his judgment in the work he had to carry out, then that would be another matter, and might well be supported. But to expect an individual to dissociate himself from every one of his activities in life before he was appointed to the Board was quite unreasonable.

Some other Unionist members took this view, and Mr. R. Hudson (Whitehaven, U.) suggested that the amendment might be withdrawn, and a new clause, embodying the principle of the amendment, might be moved on the report stage of the Bill.

Mr. R. G. Ellis (Wakefield, U.) while not opposed to the principle of the amendment, pointed out that it would make a very drastic cut of all those interested technically in electricity, and its passage would make it exceedingly difficult to appoint a Board. He thought that, if the amendment were withdrawn, it would be possible to devise some form of words to prevent any suspicion of corruption.

Sir D. Hogg, however, said that he could not give any undertaking in the matter on behalf of the Government.

The amendment was rejected by 33 votes to 14, and the Committee adjourned.

On the proceedings being continued on May 20th, Mr. Attlee (Limehouse, Lab.) moved that "a person shall be disqualified from being appointed chairman or a member of the Board so long as he is a member of either House of Parliament." He maintained that this disqualification was necessary in order that members should be absolutely independent. Otherwise, there might be a return to the evil days of the 18th century in which the Government could command an obedient body of henchmen in Parliament.

Sir D. Hogg said he could not possibly accept the amendment. He could conceive no valid reason why, because a man happened to be a Peer and therefore, whether he liked it or not, a member of the House of Lords, he should be disqualified from taking any part in the management of the Board. With regard to members of the House of Commons, a different question was involved. He had himself put down for consideration later a proposal to add words which would allow members of the Board to be members of the House of Commons. He had done so advisedly, because he felt that, although the question of profit under the Crown was not an easy one to decide on, it was probable that the existing qualifications would be wide enough to prevent a member of the House of Commons who held an office of profit under the Crown from accepting office on the Board unless words were inserted permitting him to do so. The important question of principle

whether members of the House of Commons should be eligible could properly be decided by the Committee without any pressure from the Government.

Mr. ATTLEE thereupon amended his amendment so as to disqualify only members of the House of Commons.

Sir D. HOGG then urged that it was undesirable to fetter the choice of the Ministry of Transport in setting up the Board by excluding members of the House of Commons. It was a mistake to think that when the scheme was started, the Board was going to have such a tremendous amount of work put upon it as some members of the Committee seemed to think. Once the Board began to function, the work of its members—the chairman might be in a different position—would not be very arduous. It would be work of supervision, analogous to that of a board of directors. He did not think anyone could hold that there was any substantial danger of members of Parliament being seduced from their independence by appointment to the Board.

Mr. HANNON (Moseley, U.) agreed that it would be a great mistake to impose a condition that might exclude from the Board men of high business ability and experience.

Sir F. HALL (Dulwich, U.), however, supported the amendment, pointing out that members of the Board could be drawn from the whole financial, commercial, and industrial world.

Mr. G. BALFOUR (Hampstead, U.) also thought it undesirable that M.P.'s should be members of the Board.

Lord ELVEDEN (Southend-on-Sea, U.), on the other hand, thought that, in the interests of fair play and good management, some members of the Board should be members of the House of Commons.

After further debate, the amendment to exclude M.P.'s from membership of the Board was carried by forty votes to eight.

Mr. A. ALEXANDER (Sheffield, Hillsborough, Lab.) moved the following amendment, which was accepted by the Attorney-General, and agreed to:—"The chairman of the Board and any member of the Board who is, by the terms of his appointment, required to devote the whole of his time to the performance of his duties under this Act, shall within three months after his appointment sell any securities which he may hold for his own benefit in any company carrying on the business of supplying electricity or the manufacture or sale of machinery or plant for the generation and transmission of electricity. It shall not be lawful for the chairman or any such member of the Board whilst he holds office to purchase for his own benefit any securities in any such company, and if the chairman or any such member of the Board, under any will or succession, becomes entitled for his own benefit to any securities in any such company, he shall sell them within three months after he has so become entitled thereto. Any member of the Board who, by the terms of his appointment, is not required to devote the whole of his time to the performance of his duties under this Act shall, if he is interested in any company with which the Board has or proposes to make any contract, disclose to the Board the fact and nature of his interest, and shall take no part in the deliberations or decisions of the Board relating to such contract, and such disclosure shall be forthwith recorded in the minutes of the Board."

Mr. BALFOUR withdrew an amendment to delete from the clause the provision that the Board should be a body corporate with power to hold land without licence in mortmain.

Sir D. HOGG explained that the Board could not build transmission lines without this sanction.

Mr. LANSBURY (Bow and Bromley, Lab.) moved an amendment to provide that the chairman of the Board, instead of holding office for not less than five years, should hold office "during his Majesty's pleasure."

Sir D. HOGG, in resisting the amendment, said that it would mean that the chairman and the members would be liable to dismissal without notice in the event of a change of Government.

Mr. LANSBURY said his object was to ensure that if a chairman proved unsuitable he could be replaced without waiting for five years.

Sir D. HOGG replied that in the event of misconduct a chairman would be in much the same position as a managing director.

The amendment was negatived.

On an amendment to make the period of office of a member of the Board not less than seven years instead of not less than five years, Sir D. HOGG said that, in order to remove any fears that might exist as to the possibility that at the end of five years, if there was a general election, they would have to have a new Board, he would introduce into the Bill a provision for a maximum period of office of ten years. The effect of this would be that there eventually would be a graduated period of office and they would thus constantly be having fresh blood on the Board.

Sir D. Hogg's amendment to make the period of office not less than five and not more than ten years was then agreed to.

Mr. GRANT (Derby, S., U.) moved an amendment to ensure that the salaries, &c., of the chairman and members of the Board should be under the control of the Treasury instead of being determined by the Ministry of Transport, but Col. ASHLEY pointed out that the Treasury did not desire control, as that would mean that the Board would be a State service, which they did not want. It was to be an independent Board, carrying on its own affairs, and Government control was provided by the fact that the Ministry of Transport was responsible to and subject to the criticisms of the House of Commons.

The amendment was negatived, and Clause 1, as amended, was added to the Bill.

The Committee then adjourned until Thursday, June 3rd.

(To be continued.)

The Electric Propulsion of Ships.

The Equipment of a 17,000-h.p. Twin-screw Passenger-cargo Liner.

(Abstract of a discussion before the NORTH-EAST COAST INSTITUTION OF ENGINEERS AND SHIPBUILDERS.)

THE following is an abstract of the discussion on Mr. Eskil Berg's paper on the above subject, which was abstracted in our issue of February 26th, 1926.

MR. STANLEY S. COOK thought there must be some special reasons to account for the fact that electric propulsion had made more headway in the United States than in this country; no doubt it was due to its adoption by the U.S. Navy, but it certainly did not appear to be entirely on the score of economy, as far better results had been obtained with geared-turbine warships, even in the United States. The author based his case on a statement of disadvantages of the geared turbine installation, which was misleading and incorrect. What was the complication of a few fixed steam pipes when compared with the control system and elaborate switchgear which were necessary in an electrical installation? For the new liner of 17,000 s.h.p. which was being built for the International Mercantile Marine, the steam consumption expected was to be 0.85 lb. of oil per s.h.p., but in some recent Orient liners of about the same power fitted with mechanically-geared turbines better results than this had already been obtained; for example, the *Orama*, which was built two years ago, consumed 0.785 lb. of oil per s.h.p., or nearly 10 per cent. less than the author's figure, and this result had been well maintained in subsequent service. In another of these liners, the oil consumption was 0.82 lb. per s.h.p. without the use of superheat. These installations had three turbines driving each propeller shaft through single-reduction gearing.

MR. E. A. EBORALL said that it was stated that double excitation was applied to the generator at starting, when the propelling motor started up as a pure squirrel-cage induction motor. From this one inferred that the motor had two windings, one squirrel cage for running asynchronously, and the other for excitation. At the moment of starting, the slip of the motor would be 100 per cent., and very heavy wattless rotor currents with reduced starting torque would result. In ordinary practice it was usual in the case of large squirrel-cage motors to start them with reduced terminal voltage obtained from a starting transformer, whereas in the present case, according to Mr. Berg, the stator voltage was increased. At reduced speed would the motors operate synchronously or asynchronously? If the former, then the frequency at which the current was generated must be decreased in the same proportion as the propeller revolutions, *i.e.*, at 13½ knots the turbine speed would be reduced by about 26 per cent., and it was rather surprising that in these circumstances the steam consumption should increase by so small an amount as 0.4 lb. per h.p. hour. Apart from reducing the frequency, speed reduction could be obtained by reducing the terminal voltage and increasing the rotor slip of the motors, keeping the frequency, and hence the turbine speed, constant; however, very heavy rotor currents and bad power factor would result, since the slip at a propeller speed of 90 r.p.m. would be approximately 25 per cent. The conclusion was that the reduction of voltage from 4,000 to 3,000 V to which Mr. Berg referred was merely for reducing the iron losses in the machines, and that it was therefore necessary to decrease the turbine speed for reduced ship speeds, which put electric propulsion on precisely the same basis as the geared-turbine drive in the matter of economy at reduced speeds. In the U.S. battleships the difficulty was got over by arranging the main motors to operate with a 24-pole or 36-pole connection, and speed reduction was obtained without loss of turbine efficiency. Another difficulty was that, when a ship was under helm, the largely-increased load on the inner screw might amount to 50 per cent. at full helm. Presumably, when this condition arose, the motor on the inner shaft pulled out of step and ran asynchronously. The alternator load increased and the turbine governor opened to maintain constant speed. What was there to prevent a severe overload on the alternator? If the machine had to be dimensioned to carry this overload, its weight was increased and efficiency at normal load reduced.

Mr. W. D. Horsley said that care must be taken with the insulation to withstand the atmospheric conditions at sea, by the adoption of a closed ventilating system. A disadvantage of electrical transmission was that a large number of links were introduced between the prime mover and propeller. A simple fault, such as a break in the exciter shunt-field circuit, would shut down the installation. It was not made clear in the paper whether the field rheostat and exciter losses were included in the excitation losses. When operating at the lower speed not only were the iron losses reduced, but also the windage losses; the latter formed a large percentage of the losses. Has the author considered leading the hot air from the generator to the f.d. fan inlet? A certain proportion of the alternator losses would be recovered, but the advantages of the closed-air circuit would be lost. Would one turbo-alternator be of sufficient capacity to start and reverse two motors?

Written Contributions to Discussion.

Mr. P. L. Jones stated that the author's statement that "mechanical gears for large power require a multitude of turbines and pinions" was an exaggeration. In H.M.S. *Hood*, for instance, 150,000 h.p. was arranged on four shafts, there being eight turbine casings altogether, and there were numerous examples of ships developing over 20,000 h.p. on each shaft. The figure given by the author of 300 tons of fuel per day for a 50,000-h.p. installation, including everything on board, might appear very optimistic, but it was possible of attainment in the near future. The author's weights of the main machinery for his 17,000-h.p. turbo-electric scheme were low, but not as low as could be obtained with geared turbines. With single-reduction turbines the weight could easily be brought below 30 lb. per h.p., and with double-reduction considerably lower still. It was difficult to understand how the turbo-electric scheme could be cheaper than geared turbines. The foundations for the turbines and the generator might be less costly than for the geared turbine, but the motors would require a good deal of extra expenditure in structural additions to the after portion of the ship which were not necessary in the geared-turbine scheme. The steam consumption appeared to be rather high.

Mr. C. S. Darling said it was certainly unsafe to neglect the possibilities of such a scheme as that made available by electrification. "Experiments were carried out at the outbreak of the Great War; in fact, we may claim to have made some of the earliest experiments in this line on this river with the *Tynemouth* in 1914," he wrote, and was surprised that Mr. Berg's company proposed to vary the propeller speed by varying the turbine speed, presumably to use commercial windings; but was that economical? The robustness and mechanical construction of the squirrel-cage induction motor caused designers to favour the a.c. system almost solely on this account. In this connection the following scheme did away with the bogey of the a.c. system, *i.e.*, constant speed, and permitted of a greater speed range than was otherwise possible. Assuming one synchronous generator with 10 poles; output 590 kVA (one-hour rating) at 350 r.p.m., 500 volts, 29.2 cycles per second, the efficiency at unity power factor at cos $\phi = 0.80$ would be output 590 kVA, 94 per cent. = 92.5 per cent.; output 360 kVA, 93 per cent. = 92 per cent. Combined with an asynchronous generator mounted on the same shaft with 6 poles, fed on the primary side by the above synchronous generator, and producing on the secondary side in accordance with the sense of rotation a three-phase current of 46.6 or 11.6 cycles per second:—Speed of rotor = 350 r.p.m.; output at 46.6 cycles = 500 kW (one-hour rate); output at 11.6 cycles = 240 kW (one-hour rate). Efficiency at 590 kVA and power factor = 0.92 = 91 per cent. This could be connected to one or more three-phase squirrel-cage motors absorbing the above power at the one-hour rate at 500 volts and at 29.2 cycles per second developing 150 r.p.m. approximately. Corresponding to this and the periodicities available, six speeds could be obtained with the following efficiencies (motors of two-speed pole change-over type with 12 and 24 poles and a single-stator winding) —

Periodicity.	No. Poles.	r.p.m.	Output Per cent.	Efficiency Per cent.	Power Factor.
11.6	24	58	40	87	0.6
11.6	12	117	40	87	0.68
29.2	24	150	100	90	0.84
46.6	24	233	100	90	0.84
29.2	12	292	100	90	0.90
46.6	12	466	100	90	0.90

These motors would be of the totally-enclosed pipe-ventilated type requiring each a cooling air quantity of about 0.2 metre^3 per minute per horse-power, at a pressure of about 50 mm. water column. For the synchronous generator it was necessary to provide an exciter that could have its terminal pressure adjustable from 120 to 270 volts. The exciter would be separately excited at from 30 to 50 volts. A d.c. generator of 30 to 50 volts and 700 amperes would be fitted for generating, exciting, controlling, and lighting current and for a storage battery used for emergency starting of the main engin ; and for normal starting of the d.c. generator.

The control would be effected as follows:—Speed control of motors and reversing by means of pilot control with blow-out drum electrically connected to main controller with remote control gear and interlocked with reverser. Economical speeds with constant prime-mover speed would be not less than six. For every change from a lower to a higher speed, the three-phase voltage would be first reduced by means of a small shunt controller which would directly govern the excitation of the synchronous generator. The master controller would then, by pilot control, be put on next speed notch and voltage again normalised. By this means it was possible to reduce the current rush to a minimum not exceeding normal working current and also to get gradual acceleration, which could be increased by not lowering the voltage of the synchronous generator too far, or by rapidly raising the voltage again.

Author's Reply to Discussion.

The only battleship in the United States Navy with geared turbines was the small *North Dakota*, which was equipped with Parsons turbines and gears made from designs furnished by Parsons in England. While this ship was of only 20,000 tons displacement, as compared with 32,000 tons of the *New Mexico*, it consumed more fuel at all speeds, from the lowest to the highest. This fact might have had something to do with the U.S. Navy's adoption of electric drive for this type of ship. He took exception to Mr. Cook's statement that turbine development showed that the best results were obtained by putting two or more turbines in series. Very large turbines of 50,000 kW and over must be split, but what kind of economy would be obtained from a 5,000-h.p., 1,800-r.p.m. machine built in two or more casings? With regard to the International Mercantile Marine liner, 0.85 lb. of oil included a load of over 1,000 kW on the d.c. generating sets. This ship had a very large refrigerating plant—over 500 h.p. Without refrigeration and the elaborate ventilating system required for the passengers in tropical climates, there would be no difficulty in obtaining as low as 0.788 lb. of oil per shaft-horse-power. On account of the weight, he did not as yet advocate electric drive for destroyers or light cruisers, but if higher frequency than was now used on generators were adopted, the weight might come within reach. The United States Navy was most anxious for electric drive, even for the light cruisers; the great economy at cruising speed was what the Navy desired. The new International Mercantile Marine liner had synchronous motor drive. All manœuvring would be done with the motor acting as a squirrel-cage induction motor, but, as soon as the motor reached synchronous speed, it became a pure synchronous motor. The success of this type of motor was so great, and it had so many advantages, that the General Electric Co. proposed only this type, except where economical cruising speeds were required, as on battleships, where induction motors might work better, although with slightly poorer efficiency. Speed variation by varying the turbine speed was by far the simplest and most efficient method known. There had never been the slightest damage to any of the *New Mexico's* electrical machinery; in fact, all ships built by the General Electric Co. for the Navy had so far given 100 per cent. operation. The mishap to the battleship *Tennessee*, the first electric ship built by the Westinghouse Manufacturing Co., was caused by a bolt or piece of steel getting into a motor and wrecking the winding. The accident had absolutely nothing to do with the salt air. Some of the largest power houses in the world, and a great majority of them, were located near salt water, where the ocean water was used for condensing and the air for ventilation. High-voltage machines had been run for years in such places, so no fear need be felt on that account. There was no difficulty in handling 4,000 volts on shipboard, and on ships running now no trouble had been experienced. In excitation losses the field rheostat was included, and in the fuel consumption the efficiency of the exciter was included. One turbo-generator would reverse and operate both motors up to a speed of almost 15 knots. 73.2 per cent. turbine efficiency was low and conservative, but was the guaranteed value. A better result was, of course, expected. Mr. Darling's scheme for obtaining speed variation was not necessary for a passenger ship.

A Spanish National Power Scheme.—The Madrid correspondent of *The Times Trade and Engineering Supplement* states that a recent Government decree created five principal hydraulic basins, corresponding to the great rivers, the first of which—that of the Ebro—is now in course of organisation. All the hydraulic works whether for power, irrigation, or navigation, will be co-ordinated by the Basin Commission. Then will come the linking of one basin system to its neighbours with the object of forming a national unified system. Unification of transmission voltage, standardisation of machinery and facilities for distribution, are some of the advantages hoped for from this system. The distribution lines planned total about 1,400 miles, and their estimated cost is about £4,000,000. Barcelona, where electrification is well advanced, will be the starting point of a line along the foothills of the Pyrenees, *via* Tremp and Jaca to Bilbao, the second great centre of consumption. Thence the line would run to the Duero, where it forms the frontier with Portugal, Alcantara on the Tagus, Rio Tinto, Seville, Granada, Valencia, and back to Barcelona. Branch lines would link this circle with Madrid. On the lines from Granada to Madrid and Madrid to Tortosa, exist fields of poor coal near Almodovar del Campo in the Province of Ciudad Real and near Montalban in the Province of Teruel, where thermal stations would be established. Three-phase transmission at 50 periods and 120,000 V is proposed. It is calculated that Spain has available about two million h.p. of utilisable water power. There is not at present in Spain a market for anything like this amount of power, and unless general electrification of the railways is undertaken, which would require a capital outlay far beyond the present financial capacity of the companies, it is not likely that there can be for many years to come, even with intensive irrigation.

The National Physical Laboratory.

Annual Report for the Year 1925.—*Abstract.*

THE annual report on the work of the National Physical Laboratory for the year 1925 * indicates that development continued in a satisfactory manner. In addition to a good record of research accomplished, the additional provision made for the maintenance of standards of measurements as well as of the quality of performance enabled some arrears to be overtaken; the demands on the Laboratory made by the various Research Boards and Committees of the Department of Scientific and Industrial Research continue to grow, while the volume of tests and investigations carried out for firms and other outside bodies has been well maintained, and the work done for other Government Departments showed a slight increase. The total number of tests carried out was 654,288 (as compared with 683,545 in 1924), the electricity department, including photometry, accounting for 3,674 (against 2,981).

General Research.—The report of the Executive Committee indicates that the investigations in progress in the Physics Department, under this heading, relate mainly to problems of atomic physics and to acoustical measurements. In the Radiology Division work has been continued on the structure of intermetallic compounds, and the properties of single crystals have been studied in collaboration with the Metallurgy and Engineering Departments. The researches on the scattering of gamma rays and on X-ray absorption are also proceeding. Considerable advance has been made with methods of sound measurement: Satisfactory results have been obtained in the measurement of the sound-absorbing and reflecting power of materials; the values obtained for different materials have been shown to be practically independent of the position in the transmitted or reflected beam at which the observations are made. Improved methods of carrying out reverberation tests have been devised, using a loud speaker as the source of sound; telephonic apparatus for measurements of sound intensity have been improved, and microphones based upon electromagnetic, electrodynamic, and electrostatic principles have been tried.

The research programme in the Electricity Divisions has been somewhat restricted owing to the large amount of other work in hand, much of which falls under the heading of "Maintenance of Standards." In the Electrical Standards Division interesting observations have been made in relation to certain properties of dielectrics: when a metal face slides over the surface of an imperfect dielectric, there is a sudden change in the frictional force opposing the motion when a current passes across the faces of contact; the bearing of such phenomena on the power losses and absorption effects in dielectrics has been investigated, and a paper on the subject has been presented to the Physical Society. Investigation has been made into the properties of insulating materials as employed in standard instruments: the fused quartz used in high-class condensers has been found to deteriorate rapidly under certain conditions and a method of treating it has been discovered which enables condensers to be constructed having very small power losses. Experiments will be continued with a method of measuring the amplification ratio, and the relative phase displacement of the output, with respect to the input, of an amplifying system. The construction of the horizontal force magnetometer for use at the Abinger magnetic station of the Royal Observatory will shortly be completed; preliminary trial of the instrument was made at Abinger with very satisfactory results. Progress has been made with the preliminary work on the vertical force magnetometer. In the Electrotechnics Division the research into the methods of earthing electrical circuits has been continued. Research in the Photometry section has related mainly to the use of the photo-electric cell in place of the eye in the comparison of the light intensity of different sources; as a method of colour matching, the cell has been found, under suitable conditions, to give an accuracy ten times as great as the eye, but difficulty has so far been encountered in securing, with the use of the cell, the necessary sensitivity in the comparison of the relative candle-powers of colour-matched lamps.

In the Engineering Department the research on hardness testing has been continued by the use of diamond cones for producing the indentation in the harder materials, with the aid of the machine presented by Messrs. Vickers, Ltd. In the Metallurgy Department a commencement has been made with the study of the magnetic behaviour of iron, nickel, and cobalt from the point of view of the lattice theory; the line of attack adopted is to compare the effects of dimensional changes produced by magnetisation with those caused by elastic deformation and apparatus for producing, and for accurately measuring, the required magnetic field has been designed in collaboration with the Electrical Standards Division. The study of the crystal structure of metals and alloys, in conjunction with the Radiology Division of the Physics Department, has been continued, and apparatus for X-ray analysis, including a Müller X-ray spectrograph by Messrs. Hilger (the gift of Sir Robert Hadfield) has been installed. Experiments on fatigue have been continued and the experimental work done on the behaviour of metals under plastic deformation at varying rates (ranging from slow compression in a testing machine to compression by means of detonating explosives) has been extended to copper and aluminium.

Maintenance of Standards.—The term is necessarily very wide; the additional provision allowed has permitted increased attention to be given to this work during the past year, though, unavoidably, the continuous increase in the demands made on the Laboratory by outside bodies tends to limit the time available for such work. Work on the primary electrical standards has been mainly concerned with the redetermination of the international ohm as defined by the resistance of a column of mercury; the new values of the resistances differed from the previous values by about 1 part in one hundred thousand. Mr. F. E. Smith recently suggested that the time is opportune for the adoption of the absolute electrical units, as defined in terms of the C.G.S. units of mass, length and time, in place of the international units at present employed, and the Executive Committee has appointed a Sub-Committee to give this suggestion careful consideration. The Board of Trade standard one-ohm coil, ampere balance, and voltmeter have been compared with the Laboratory standards and the results indicate that the standards remain in a satisfactory condition.

Much time has been devoted to work on radio-frequency standards and to the use of quartz piezo-electric resonators and oscillators; these possess the particularly valuable properties of simplicity and portability, and at the same time enable selected frequencies to be reproduced with the precision of a primary standard. The Electrotechnics Division has studied methods of measurement and the characteristics of instruments for use in large power installations; new standard alternating-current apparatus has been brought into operation. The general adoption, in lamp specifications, of values of mean spherical candle-power has made it necessary to provide additional sub-standards for such measurements. A comparison of standards has been made with the Bureau of Standards and the Laboratoire Central d'Electricité, Paris, showing good agreement at the temperature of the ordinary carbon lamp; with sources of light of higher efficiency the precision of measurement is reduced, owing to the colour difference between these and the primary vacuum standards, which operate at a much lower temperature.

Government Research.—The Department of Scientific and Industrial Research has taken the valuable step of stabilising some researches by sanctioning expenditure over a term of years. The programme arranged by the Illumination Research Committee relates largely to the illumination of rooms, by daylight or artificial light, and the effect of different kinds of illumination on the accuracy, speed and comfort of working. Tests have been made of the efficiency of certain types of diffusing glass fittings for artificial illumination and an investigation into glare in street lighting has been arranged.

Work for Outside Bodies.—The total volume of work undertaken, on payment, for outside bodies and firms was, approximately, equal to that of the preceding year. Researches in progress include the study of the effect of impurities in copper. An investigation regarding the presence of oxygen in aluminium has led to the conclusion that oxygen is not soluble in aluminium and that oxide is found only on the surface of the metal. The work on buried cables in the Electricity Department has been continued for the British Electrical and Allied Industries Research Association, and other investigations for this Association are in progress.

Other Services Rendered by the Laboratory.—Frequent visits are paid to the Laboratory by the representatives of firms who wish to obtain particulars concerning the methods of test employed by the Laboratory or to gain information which may help them to improve the accuracy of their instruments or the quality of their products. Such intercommunication is not only of value in aiding private firms to bring promptly and effectively into practical use the developments arising from scientific progress, but serves also to keep the staff in close touch with industrial needs. In view of the direct claims on the time of the staff it is difficult to provide adequately for this side of its activities, but the Laboratory strives in this manner, so far as circumstances permit, to place the knowledge it has acquired at the disposal of those to whom it may be of service. Notes on points of interest in relation to the performance of electrical instruments are being collected with a view to publication. Help has recently be given to a firm in the setting up of equipment for carrying out magnetic tests. A large number of visitors is received at the Laboratory from dominion, colonial and foreign institutions, and opportunity is afforded Government technical officers in the Colonies or Dominions to work for a period at the Laboratory in order to acquire familiarity with the methods employed in particular branches of work and with special processes.

New Buildings.—The building for high-voltage work was completed in the course of the year and the necessary equipment and connections for the lighting, heating and power supplies are now being installed. Sir Richard Glazebrook visited the United States to see the high-voltage plant which has been

* H.M. Stationery Office. Price 8s. 6d. net.

erected at the research laboratories of the General Electric Co. and elsewhere, in order to advise the Committee. He was accompanied by Dr. Rayner, head of the Electrotechnics Division of the Laboratory, and by Mr. G. Smith of the Engineering Division of H.M. Office of Works, and also visited subsequently the works of the Compagnie Générale d'Electro-Céramique at Ivry, to inspect the million-volt air transformers which have been installed there for insulation testing. Sir Richard's report recommended the adoption of the air transformer as most suitable for research purposes, and H.M. Office of Works is arranging for the supply of the necessary plant. Plans for the proposed new Physics Building have been prepared and congestion in other buildings of the Laboratory continues to increase. The provision of a new building for photometry, to relieve the present congestion in the Electrotechnics Building, is a very urgent requirement.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

An Oil Fuse for Rural Use.

One of the hindrances to the development of the rural use of electricity is the difficulty of tapping main transmission lines at small enough cost to render the supply justifiable. Under such conditions an oil fuse produced by MESSRS. FERGUSON, PAILIN, LTD., Higher Openshaw, Manchester, should be of considerable utility. The apparatus, shown in fig. 1, with the fuse element withdrawn from, and lying across, the oil tank, is suitable for service on systems up to 11,000 volts between phases for either indoor or outdoor use. The fuses are of the single-pole type, and each is completely self-contained; the main frame casting is fitted with flanges for the fixing bolts and carries the cable-sealing arrangements and the fixed fuse contacts. Its dome shape ensures strength under fusing conditions and allows an air space above the oil level. The fuse plug is inserted through a hole in the top of this casting, and the oil tank is clamped to the main frame by four down rods. The fuse plug is made of impregnated teak with a galvanised metal holder at the upper end and the fuse contacts at the lower; the fusible element, which passes round the base of the plug, is held in tension between two spring contacts which ensure a rapid break in oil. As there is no operating mechanism, the time interval between the occurrence of a fault and the interruption of the circuit is small, the break taking place before the short-circuit current has attained its maximum value, which fact reduces the duty on the fuse. To insert the fuse

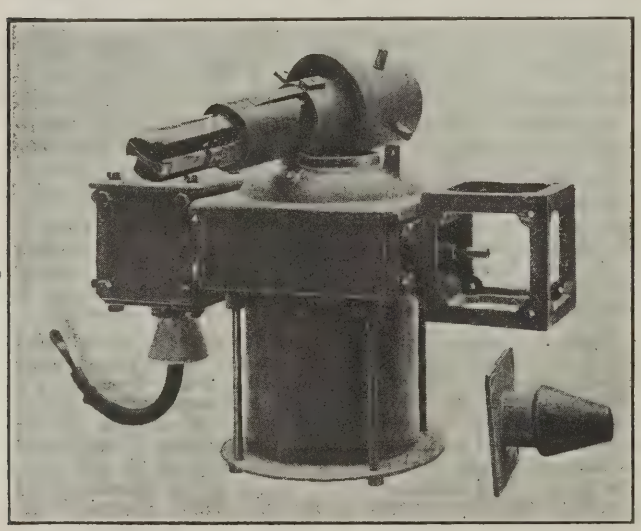

Fig. 1.—An Oil Fuse.

in circuit it is necessary to push the plug fully home, and then turn it, thus locking it in position. Contact is not made until the plug, which is earthed, is turned and locked so that it is impossible for it to be blown out if inserted under fault conditions; v.i.r. cable can be brought right in to the fixed contacts through bell-type porcelain insulators, or cable sealing ends may be fitted.

Another Vacuum Cleaner.

We have received from the BRITISH ELECTRICAL AND MANUFACTURING CO., 7-13, Clavering Place, Newcastle-on-Tyne, some particulars of the "Orion" vacuum cleaner which it has recently put on the market. The machine is equipped with a suitable suction nozzle, 12 in. long, for use under very low furniture. A specially-designed device is embodied for raising or lowering the nozzle to suit the thickness of the carpet which is being cleaned. A continuous-action rotary pedal switch of robust design is fitted. The bag is conveniently emptied, it is claimed, by virtue of a broad rim which can be held between the edges of the soles of the shoes during the emptying operations. The motor is of the universal type for use on a.c. or d.c. circuits.

A Portable Lifting Equipment.

The accompanying illustration, fig. 2, is one of a range of lifting appliances, "Diard Lifters," which is being introduced in this country by MESSRS. TRACTOR TRADERS, LTD., 36-37, Queen Street, London, E.C.4. The apparatus is of a portable nature, and its design and construction suggest its suitability for use in lifting transformers and motors from pits. It consists primarily of a cross beam carrying a travel-

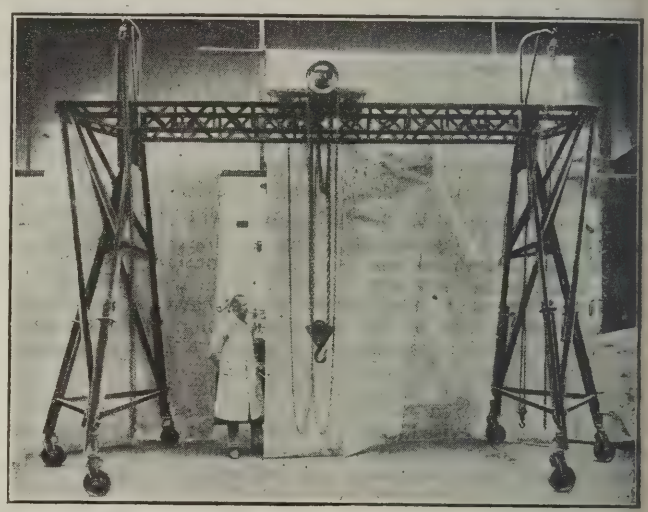

Fig. 2.—Portable Lifting Apparatus.

ling Weston-type block and mounted on suitable tripods. It is made in varying styles of fixed or adjustable height, the latter type being provided with telescopic legs, and with the legs mounted on rollers or not. Plates are supplied for the feet to rest on to prevent sinking on soft ground. It is made in two sizes, with capacities of 1.5 and 3 tons. The travel limits of the whole range varies from 7 ft. 3 in. to 9 ft. 8 in., the minimum and maximum load-hook heights being 6 ft. 5 in. and 11 ft. 4 in. respectively.

An Improved Ultra-Violet Lamp.

The "Percy Hall Clinic," illustrated in fig. 3, is a lamp which has been recently designed for ultra-violet radiation by the COX-CAVENDISH ELECTRICAL CO. (1924), LTD., 105, Great Portland Street, London, W.1. The apparatus is designed for use with one pair of swaged tungsten electrodes, which provide, it is claimed, the richest output of ultra-violet

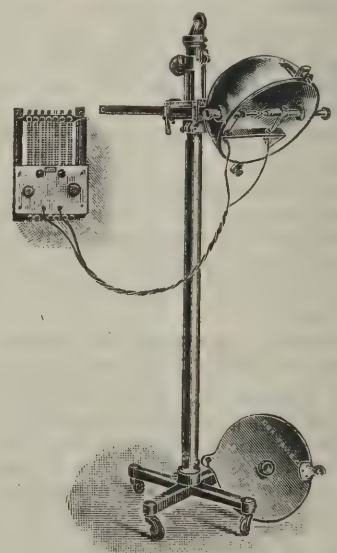

Fig. 3.—Ultra-Violet Lamp.

radiation of any known arc. The desired gap is set in the usual way, but by means of a spring mechanism the arc is struck and set at the required distance. The 14-in. nickel-plated reflector is held in a metal hood, which is

carried on a roller-bearing cross arm. At a distance of 4 ft., it is claimed, the whole body of a normal person may be radiated. The loading of the lamp for the best results is 3½ to 4½ A at 240 V d.c. The adjustable resistance enables the lamp to operate on any pressure from 60 to 250 V.

A Copper Tungsten Electrode.

The GENERAL ELECTRIC Co., of America, has evolved a new welding electrode of copper-tungsten, which is expected to prove of great value in the fabrication of metals, and for which the following claims are made. The alloy has a hardness of 225 (Brinell) as compared with 82 for hard copper and 30 for soft copper, and the compressive strength of the copper tungsten is 208,000 lb. per sq. in., as against 58,000 lb. for hard copper. The tensile strength is 56,350 lb., compared with 30,000 lb. for soft copper and 50,000 to 70,000 lb. for hard drawn copper.

The new material does not anneal at red heat. In view of the higher first cost of copper-tungsten, its chief value is expected to be in special applications. It is particularly adapted for use under severe conditions which copper will not withstand, such as hot-upsetting rivets electrically, and in facings for clamps for rod welding. The durability of the new alloy is shown by a recent test, where the number of welds made with one dressing of a copper die averaged ten, while the first test using copper-tungsten inserts gave more than 1,000 welds with the die still in good condition at the end of the test.

The material, Elkonite, is to be manufactured and sold exclusively by the Elkon Works, Inc., Weehawken, N.J., of P. R. Mallory & Company.

An Electric Singeing Machine.

A machine, the object of which is to burn off the down or short protruding fibres from yarn, is referred to in the *Textile Recorder*. The yarn appears to be passed through a tube, the wall of which is an incandescent electric conductor, the internal heat being just sufficient to perform the object of its design. It is claimed that only a little heat and no injurious gases are generated and that the heat radiated by the tube can be regulated by almost imperceptible degrees to suit any size or count or yarn. The machine is a product of the HUSSA MACHINE WORKS, 50, Church Street, N.Y.

The Economic Situation in Belgium.

Rapid Electrical Progress.

A REPORT bearing the above title has been forwarded to the Department of Overseas Trade by Mr. J. Picton Bagge, Commercial Secretary at the British Embassy, Brussels.*

In his introductory remarks Mr. Bagge says that the year 1925 was on the whole satisfactory, notwithstanding a general tone of pessimism. While imports fell as compared with 1924, exports were higher, in spite of increasing costs of production and dearer money. The work of reconstruction which was commenced seven years ago has now been practically completed. Factories have been re-built and re-equipped; railways, canals, telegraphs and telephones have been repaired: world markets have been regained to a great degree; and finances have been considerably straightened out. The reconstruction has been particularly marked in the great metallurgical industry, in which the capacity of production has been largely increased by the modernisation of plant and by extensions. Economy of production has been attained to a great extent by the utilisation of waste products and by co-operation between several important factories in the matter of electrical energy. The use of electrical power has been a most important feature in industrial development. Power stations have sprung up everywhere and a network of h.p. cables now covers the whole country. The network grows rapidly year by year, and is reaching the most isolated hamlets and farmsteads. One effect of this has been the re-birth of a number of cottage industries.

Electric Light and Power.

As stated above, the development of the use of electricity for light and power purposes is astonishing in its rapidity. In 1924 the extensions undertaken by the various companies called for increases of capital amounting to over 100 million francs, and issues for a similar, if not a slightly larger, amount had to be made during 1925. These capital issues were quite independent of the sums expended by certain provincial and communal authorities. In the province of Antwerp excellent progress has been made in the northern districts with the installation of the system, which, in certain places, has been completed. In the province of Luxemburg a loan has been authorised for the electrification scheme. In the south of the province of Hainault an inter-communal co-operative society has been formed for the establishment of an electrical system. In the province of Namur work on a system is in progress, and the same is the case in the province of Limburg and in the Flanders provinces. The scheme in the cantons of Eupen and Malmédy involves the construction of a barrage in the valley of the Warche. A company with a capital of 40 million francs is carrying out the operations. In addition to the stations of private electrical companies and public authorities, a great deal of energy is produced and sold through distributing companies by the central power stations of important coal mines and industrial concerns. In this connection, the results of the co-operation in the Liége district are of interest. The system of this amalgamation, the Union des Centrales Electriques, now comprises 126 km. of cable, and 24 important sub-stations connect 29 central stations belonging to 22 metallurgical, coal, tramway, and electrical companies. The load-dispatching organisation governs the exchange of energy between the various central stations which have a total power of 125,000 kW. The exchange of energy now annually exceeds 50 million kWh or 27 per cent. of the total consumption of the affiliated works. The substitution of gas from blast furnaces and by-products for fuel which would have been consumed by the independent functioning of the machines, the stoppage or non-installation of which has been rendered possible by this co-operation, represents an annual economy of more than 70,000 tons of coal. Similar co-operation is also to be found in the Borinage, where five collieries have amalgamated for power purposes, and in the Charleroi district, where certain important metallurgical concerns have also done so.

At December 31st, 1924, there were 20 stations with a capacity of over 15,000 kW, the total being 550,000 kW. There were five stations with a capacity of between 10,000 and 15,000 kW, with an aggregate power of 55,450 kW. The total capacity of the stations affiliated to the Union Centrale Electrique de Belgique, which groups the principal distributors, is 690,000 kW. In 1924 these stations furnished 630 million kWh.

Telegraphs and Telephones.

During 1925 a new line, 40 km. in length, was set up between Keppen and Asch, while additional wires totalling 112 km. were placed on 13 existing lines. At October 31st, 1925, the total length of the lines forming the telegraph system was 42,370 km. The contract for the equipment and laying of the La Panne-Ostend-Brussels-Herbesthal international cable was given in December last, and credits for 14 million francs have been assigned for this work in 1926. The total cost is estimated at 70 million francs.

With regard to telephones, three automatic exchanges are now in operation in Brussels and the conversion of two other exchanges is to be undertaken this year, and the remainder will be converted within the next two or three years. In the 1926 budget 124.5 million francs has been set aside for the improvement and extension of the telephone system. During the current year it is proposed to replace many overhead wires by underground cables in several districts. The total length of line at October 31st last, was 870,370 km., as compared with 786,249 km. in 1924. In the international service a number of new lines were put into commission in 1925. The lines under construction are Antwerp-Strasbourg (one line), Brussels-Nancy (two lines), Brussels-Paris (three lines), and Brussels-Rotterdam (one line).

Work on the inter-Continental radio station at Ruysleede has made good progress; the necessary buildings have been completed and are being equipped. Three high-frequency groups and three continuous current groups have been installed, and work on them is almost completed. The station is expected to be opened for service in the autumn of this year.

General.

The Bill introduced by the Government in 1923 with a view to remedying defects in the existing regulations governing concessions for production and distribution of power, and wayleaves over roads and private property, became law in March, 1925. A Royal Decree of April further provided for the formation of a permanent consultative committee composed of between 20 and 30 members appointed for a term of four years. The object of the Committee and of any sub-committees that it may appoint, is to report to the Ministry of Industry and Labour on any question put to them by that department.

While there does not seem to be any general desire to abolish the principle of the 8-hour day, which was instituted by law in 1921, there is an outcry against its rigid application in the present abnormal economic circumstances. It is stated that more flexibility is desired in seasonal industries and in times of urgent orders, and that contracts have been lost owing to the impossibility of giving quick delivery. Several labour conflicts occurred during the past year, the most important being those in the iron, steel and constructional industries. The Charleroi iron and steel works strike had not been settled at the time of the preparation of the report (February).

Legal.

A Long Firm Fraud.

Sentence of three years' penal servitude was passed recently at the Central Criminal Court on Hyam Reuben Spinney, wireless engineer, who was found guilty of conspiracy to defraud and obtaining goods by false pretences. Robert Banks, electrician, was sentenced to 12 months' hard labour for a similar offence, and Robert Spinney, electrician, was bound over in the sum of £5 to come up for judgment if called upon.

Mr. Percival Clarke, for the prosecution, said that the defendants were charged with conspiracy with E. J. Benson, not in custody, and other persons unknown, to defraud such persons who might be induced to part with their goods to the Hotel and Restaurant Staff Supply Co. and the Southwark Electrical and Wireless Supply Co. Banks was charged in connection with four companies—G. A. Kirby & Co., Ltd., F. Garren & Co., the Cry-set Electrical Co., Ltd., and the East End Electrical Engineering Co. Counsel said the defendants falsely represented that they were carrying on a genuine business. The period covered by the charges was from the beginning of October last year to the middle of January of this year, and the amounts involved totalled £172. Reuben Spinney took premises in Blackfriars Road and traded as the Hotel and Restaurant Staff Supply Co. and as the Southwark Electrical and Wireless Supply Co.

G. Cohen & Sons, Ltd., v. London Transit Trading Co., Ltd.

At the Mayor's and City of London Court, on May 14th, before Judge Shewell Cooper, the plaintiffs, of Commercial Road, E., sued the defendants, importers, Long Lane, E.C., for £50 balance due on account of the purchase of a second-hand electric crane. Mr. Fortune, for the plaintiffs, said that representatives of the defendants had inspected the crane in question at a wharf, and were informed that its life as a three-ton crane was ended, but that it was safe to handle loads up to 20 cwt. The defendants agreed to purchase it for £100, but took no further action until proceedings were threatened, when they remitted a cheque for £50. In reply to a further communication, defendants replied that they had had the crane inspected by an expert, who reported that it was unfit for service. Moreover, they claimed that a verbal guarantee had been given that the crane was capable of lifting from 20 to 30 cwt. They claimed damages totalling £165 for putting the crane into condition and preparing foundations. Mr. Foxwell, giving evidence for the plaintiffs, said that the defendants' representatives had been satisfied after examining the crane for half-an-hour. He denied stating that the crane was capable of raising from 20 to 30 cwt.

Mr. Louis Segal, who gave evidence for the defendants, maintained that that guarantee was given and that certain defects were not pointed out to them. He called witnesses to testify to the bad condition of the crane. Mr. Fortune held that it was a case of *caveat emptor*, and the Judge upheld that contention, giving judgment for plaintiffs for £50 and costs and dismissing the counter-claim with costs.

Charge Dismissed.

Before Judge Atherley Jones, K.C., at the Central Criminal Court, on May 17th, Anatole Ivan Zaitzeff, merchant, pleaded not guilty to a charge of conspiring with others to defraud persons who might be induced to part with goods to N. A. Ludwin & Co. and Importex, Ltd., and of obtaining goods by false pretences from Messrs. Hogan and Wardrop, Ernest Flury, the Igranic Electric Co., A. J. Stevens (1914), Ltd., and others.

Mr. Dodson, prosecuting, said that the indictment alleged that prisoner, together with two men, named Ludwin and Smith-Hickie, between July, 1924, and April, 1925, obtained from seven traders radio components valued at between £1,000 and £1,200 by pretending that the goods were to be supplied to firms which were solvent, reputable, and able to pay for what they ordered in the ordinary course of business. Counsel suggested that N. A. Ludwin & Co. and Importex, Ltd., were created merely for the purpose of getting goods from reputable traders, and that there was no intention of paying for them. The goods which had been supplied to the two concerns were never paid for. The men concerned in the case were last September committed for trial on charges of conspiracy to defraud and obtaining wireless goods by false pretences. Ludwin and Smith-Hickie were dealt with but the accused went to Germany, and was extradited. In April, 1923, Ludwin took the first floor of premises at 122, Bunhill Row, in the City, and on the door of those offices the names of a number of concerns were put up, amongst them being The General Distributing and Trading Co., Ltd.; the British Overseas Dental Supplies, Ltd.; N. A. Ludwin & Co.; A. I. Zaitzieff and Co., Ltd.; and Importex, Ltd. There also appeared the name of the Lancashire Trading Co., Ltd., which in the early part of 1924 removed to 25, Budge Row. Counsel said that the accused was really that company, and the part which he played at that address was the giving of references in favour of Importex, Ltd.

The defendant, in the witness box, denied all the charges alleged against him. He stated that he had nothing whatever to do with the negotiations entered into between Ludwin and various wireless traders, beyond giving references which he said he gave in perfectly good faith. His business was a distinct one from the others and it was his misfortune that he was in the dock on the present charges.

He was found not guilty and discharged.

Power Station Employés Charged.

At the South-Western Police Court on May 19th, George Powerswell, a pump attendant, Ernest Calf, a switchboard attendant, and George Sturley, an engine driver, all employés at the Fulham Council electricity undertaking, were charged with committing acts calculated to prevent the proper working of the power station at Townmead Road, Fulham. The prosecution was conducted by the Town Clerk of Fulham, who said that the proceedings were taken under the Emergency Powers Act. During the recent strike the whole of the electricity supply had been stopped, necessitating the closing of all factories in the borough for over an hour.

Mr. W. H. Thompson, instructed by the Electrical Trades' Union, urged that the men lost control of their judgment in the excitement. They did not attempt any damage and in shutting down the machines thought that they were acting in the best manner.

Mr. Ratcliff Cousins, the magistrate, thought that there had been no malicious intention in the men's actions, he therefore bound them over in recognisances of £5 to surrender for judgment if called upon in six months.

Infringement of a Radio Trade Mark.

A motion by Lissen, Ltd., dealers in radio apparatus, for an injunction restraining E. Harper & Sons, trading as the Willesden Wireless Stores, from infringing its trade mark for radio goods, was mentioned to Mr. Justice Romer in the Chancery Division on May 19th.

Mr. Hodges, for the plaintiffs, said that defendants were willing to submit to a perpetual injunction, an inquiry as to damages, and to pay the costs, having agreed to treat the motion as the trial of the action.

Neon Tube Patents Extended.

Mr. Justice Tomlin, in the Chancery Division on May 18th, heard an application on behalf of M. Georges Claude, for an extension of the period of two patents for improvements in vacuum discharge tubes for lighting purposes, and for improvements in neon tubes, owing to loss of benefit caused by the war.

Mr. Trevor Watson said that the phenomenon of the production of light by an electrical discharge was old, but M. Claude was the first man to put it on a commercial footing. Neon light was the best fog-piercer known and was of great importance for shipping and aeronautical purposes.

His Lordship granted a five years' extension in each case.

Trade-Mark Applications.

The following are among the recent applications for British trade marks. Objections may be made against any of the proposed marks within one month from May 5th. In the case of foreign applications, the names and addresses of the British representatives are also given :—

Glyptal. No. 468,205. Class 1. Varnishes and lacquers.—British Thomson-Houston Co., Ltd.

Clayton (lettering and design). No. 459,896. Class 7. Electric road traction motors. No. 459,898. Class 22. Electric road wagons, &c.—Clayton and Shuttleworth, Ltd., and Clayton Wagons, Ltd.

Stentor. No. 455,078. Class 8. Thermionic valves.—A. C. Cossor, Ltd.

Sistoflex. No. 462,593. All goods in Class 8.—Spicers, Ltd., 19, New Bridge Street, E.C.4.

Rauland-Lyric (lettering and design). No. 459,462. Class 8. Electric transformers.—All-American Radio Corporation, Chicago, U.S.A. (E. P. Alexander and Co., 306, High Holborn, W.C.1.)

Rectron. No. 467,022. Class 8. Instruments, apparatus and parts thereof for use in radio-telegraphy and telephony.—Radio Corporation of America, New York, U.S.A. (White, Langner, Stevens & Parry, Jessel Chambers, 88-90, Chancery Lane, W.C.2.)

Cleartron, No. 468,117, and C. T. Clearton (lettering and design). No. 468,118. Class 8. Philosophical and scientific instruments for useful purposes.—Cleartron Radio, Ltd., 1, Charing Cross, S.W.1.

Edix. No. 468,196. All goods in Class 8.—The Magneto Accumulator and Electro-plating Co., Leafield Road, Dumfries.

M.K. No. 466,422. Class 8. Electric contacts, terminals, fusible cut-outs, and switches (ordinary).—"M.K." Electric, Ltd.

Traun. No. 457,274. Class 40. Hard india-rubber accumulator boxes, insulators, &c.—Heinrich O. Traun, trading as Dr. Heinrich Traun & Sohne vormals Harburger Gummi Kamm Co., Hamburg, Germany. (D. Young and Co., 11-12, Southampton Buildings, W.C.2.)

The

Electrical Review

VOL. XCVIII. JUNE 4, 1926. No. 2,532.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

LIST OF FOREIGN AGENTS (see first page "Official Notices").

Supply must be Safeguarded.

THOUGH the more immediately pressing matters with which Parliamentary minds have been occupied prevented the Standing Committee from proceeding as rapidly as might be desired with its consideration of the Electricity Bill, it is perhaps just as well that recent untoward events happened before that measure passed beyond the amendment stage.

It may be that the Acts already contain provisions which adequately cover all recent experiences, and include ample authority for legally proceeding against all who were responsible for interference with the maintenance of electricity supply services. The most remarkable and unexpected action reported in certain areas where councillors, who had been elected as representatives of the public to maintain services, deliberately used their authority to shut them down, must have led to deep thinking on the part of the Electricity Commissioners, the Joint Authorities, the Incorporated Municipal Electrical Association, and others responsible for the future security of electricity supply.

The importance of maintaining continuity of supply has been in the forefront of all questions for many years. Technically and administratively it has been regarded as fundamental—a statutory obligation from which there was no escape, a duty devolving upon the engineer technically and a responsibility resting upon the authority under which he served, to maintain the continuous flow of a vital service for which the State had granted a monopoly. In times past there were prosecutions of undertakings which from various causes were temporarily unable to give service or which failed to maintain the supply at suitable pressure. Where authorities have been able to prove that they have done their best to cope with an exceptional situation, the law has not been exacting. But what shall be said of those who, though as municipal representatives they have shouldered responsibility for looking after the public interests, deliberately cut off all service whatsoever—sinking even to that lowest of all levels which allowed them to deprive hospitals of supply essential to the efficient conduct of operations for the relief of suffering humanity? And where, we may ask, can one find any authority under the Electricity Supply Acts for any discrimination between essential and non-essential supplies? Withholding the supply to any class of consumer for strike reasons can have no legal justification.

Recent experiences seem to us to raise vital issues, and we hope that all that is involved will be fully appreciated by those whose duty it is to introduce any new legislation that may be required to strengthen the weak places against all future attacks on public safety and security. They should consider that all the efforts to secure continuity both by having sufficient plant capacity installed or interconnected and by striving after efficiency of technical equipment, as well as all the advantages of bringing undertakings under Joint Authorities, can be rendered useless if the personnel fail to operate or the local governing authority chooses autocratically to misuse its power and cut off supply to any class whatsoever of ratepaying consumers—part-owners of the undertaking.

It cannot be too plainly stated that councillors are elected by the ratepayers to look after their interests as a whole, and if they deliberately fail in any part of that duty they are traitors, and should be treated as such. Surely the maintenance of a borough's industries, giving employment to people resident in the area and earning profit in the borough, paying rates for the up-keep of the borough services, is a matter of first concern! Councillors and committee-men are servants of the electors, and so are the electrical staff and employés. Those who traitorously impose or authorise the cutting-off of power which is essential to public and private convenience or to any industry—whether there is a national or a local or an industrial dispute in progress does not affect the matter if we have regard to their *raison d'être* as councillors—are guilty of robbing workers of wages, businesses of trade and profit, the State of taxes, and the community of a public service *which is actually its own property*. Men who will do so for no other reason than that the colour of their political or social views places them in sympathy with some self-appointed dictatorial council, are totally unfit to occupy any position of public trust and confidence, and should be subject to suitable treatment under the law of the land, or from Central Government, rather than be permitted to continue in authority until the ratepayers dismiss them at a Borough Council election. They should be rendered ineligible to continue to hold either employment under, or seats on, a Council, for they are a danger to the community.

Powers granted to give supply of electricity involve responsibilities. These must not be lightly regarded, but must be quite beyond all danger of interference due to changes in political thought. There must be heavy penalties, and they must be personal penalties, imposed upon men who, in spite of the fact that their local prestige as councillors or their bread and butter as employés is derived from an undertaking, attempt to shut down their own and others' employment by betraying a trust which has been reposed in them by the community as a whole and by the individual consumers, who naturally suppose that they can rely upon the Council as a contracting party to an arrangement to provide one of the vital services for the maintenance of the working life and safety of the people.

Councils elect committees and appoint officials to control and *run* their undertakings—they do not, indeed *cannot*, give them authority to *shut down*. They have no such power without appealing to higher authorities—neither engineer nor Council, neither committee nor employé—because electricity supply is a service given under monopolistic powers granted by the State. Happily the remarkable incidents which have called forth these comments were exceptional; were it otherwise one would feel that if a policy of municipalisation allowed the continuity of supply to be jeopardised by anti-national parties at whim or in a fit of mental aberration, then it might, even at this date, be necessary to ask seriously whether municipalisation was the right thing after all.

One other thought in closing—areas which acquire for themselves the reputation for being erratic in their regard for vital services will be stamped as undesirable by those who desire to start up new industries, and owners of existing works will be ready to leave at the first convenient opportunity.

Registration of Engineers.

TIRED, apparently, of waiting for the big Institutions to deal with the question, the Society of Technical Engineers has prepared a scheme for the registration of engineers, in the form of a Parliamentary Bill, which has been introduced into the House of Commons by the chairman of the Society's Executive Council, Mr. Herbert Williams, M.P.; but it is not intended to proceed with the Bill before the fullest consultation has taken place with all the interests concerned. To this end, copies of the Bill have been forwarded to the leading engineering bodies for consideration with a view to securing general agreement, and the Society suggests that the matter should be referred to the Engineering Joint Council.

In an introductory memorandum it is pointed out that a somewhat similar measure was passed into law in Italy in 1923, and that in the State of New York an Act of the State Legislature provides for the registration of engineers; moreover, the Royal Society of British Architects is preparing a Bill for the registration of architects. The present Bill contains provisions enlarging the powers and functions of the principal engineering Institutions, which would be brought into the closest relationship with the operation of the scheme if it became law.

With the objects of the proposal we are entirely in sympathy, though many points will call for the closest scrutiny, and in view of the deliberation with which such matters are handled in this country, it is questionable whether it will become an Act within the life of the present Parliament. That the term "engineer" is continually misapplied in the lay Press and in popular usage, is only too well known to those who are entitled to use it, and the ready adoption of the epithet "chartered" by members of the Institutions which are incorporated by Royal Charter is evidence of their desire to obtain a distinctive appellation; but the trouble resides in the fact that the language itself is made and moulded by popular usage, and if the public continues to regard a mechanic or a fitter or an engine-driver as an "engineer," all the Acts in the Statute-book will be unable to turn it from its purpose.

The community has no conception of the part that is played by the engineer (in the correct sense) in its daily life; water, electricity, gas, and transport are only a few of the services for which he is responsible—but he is a "dumb dog," and neither tries nor cares to secure his rightful position in the public eye. Whether the enterprising action of the Council of the S.T.E. will be rewarded with eventual success we cannot tell; it has our sympathy, and we hope that at least it will receive full consideration by all concerned.

The I.E.E., the I.M.E.A., and the Bill.

THE annual report of the Council of the Institution of Electrical Engineers, whilst containing no sensational items, records a very satisfactory year's work. The membership at March 31st was well over 12,000, showing a steady net increase of about 400 a year, and the activities of the main body and its numerous branches and committees were more than maintained, 374 meetings having been held during the year. From the summary which appears on p. 857, it will be observed that there are now nine "Technical Committees," which will endeavour to improve the supply of suitable papers; that the Committee on Electricity in Agriculture is doing good work; that the Council has submitted recommendations to the Electricity Commissioners for the amendment of their regulations for electricity supply; and that attention is being given to the question of status of engineer officers in the Royal Navy. Unfortunately, owing to lack of interest in the establishment of a national proving house, the proposal, so dear to the late Mr. Wordingham, has been dropped.

Conspicuously wanting is any reference to the most important question now before the electrical industry—the Electricity (Supply) Bill. On March 29th the Council of the Institution submitted to the Government

a grave warning to the effect that the provisions of the Bill were based upon a misapprehension of the facts; in the opinion of the Council they might prove detrimental to the progress of the industry, and it was considered of the greatest importance that an inquiry should be held before the Bill became law; but it was elicited from the President at the annual meeting that no further steps were contemplated by the Council, the various sections of the Institution being left to speak for themselves. But the Council cannot have it both ways: either, for the reason stated, no action should have been taken at all; or, having decided to enter a vigorous protest against the Bill, the Council should have been prepared to follow it up with energetic measures to press the protest home. Half-measures "cut no ice." At least we should have thought that a meeting could have been called, informal or otherwise, to enable the members to discuss the Government's proposals and to record their views thereon. Unless that is done, the Council's protest will fall on deaf ears.

The Council of the Incorporated Municipal Electrical Association, not for the first time, has grasped the nettle more courageously, and last week convened a special general meeting of its members, who admittedly have a common and immediate interest in the subject. The meeting passed a resolution, of which the terms are given on p. 840, expressing the belief that in its present form the Bill will fail to attain its object—the cheapening of electricity supply—and proposing that the industry should be consulted before any legislation is enacted. That view, it will be remembered, has been repeatedly put forward by Mr. R. A. Chattock, President I.E.E. The resolution also throws doubt upon the figures and conclusions of the Weir report, and deprecates the suppression of the Merz report. As our readers are aware, we are entirely in accord with the purport of this resolution, as well as with the protest of the I.E.E., both statements having been anticipated in our columns by many weeks. But why has action been deferred until the Bill is actually in Committee? Certainly neither the I.E.E. nor the I.M.E.A. can be accused of "undue haste."

The Radio Exhibition.

IN our "Business Notes" this week we give some particulars of the National Radio Exhibition, which is to be held at Olympia in September. It will be seen from the note that although the show is being organised in the name of "N.A.R.M.A.T.," the Society of Radio Manufacturers is taking a hand, and in our opinion this co-operation is all to the good, preventing the inevitable overlapping and jealousy which the holding of two separate exhibitions would engender. The necessity for two exhibitions has been eliminated by the wise decision of the organising associations not to confine the exhibition to their members only. As we said last year, an exhibition of that character cannot fail to be incomplete and unrepresentative.

The early entrants to the Exhibition are to be allotted space by means of ballots, a method of which no one should complain, for any other system generally brings disputes in its train. British goods only are to be displayed; this, too, is satisfactory, for British manufacturers are now able to produce practically everything that is required in the way of radio apparatus, even if their prices are sometimes just a trifle higher than those of imported products. The decision to ban loud-speaker demonstrations may disappoint a few exhibitors, but the majority will realise that a dozen loud speakers at full blast, some of them reproducing different programmes, will not appeal to the ears or pockets of the visiting public, apart from other considerations. Ordinary telephone demonstrations are in a different category, but for some reason these, too, have been banned.

We see no reason why this Exhibition should not be successful and help to restore harmony in an industry which cannot thrive as it should if divided into hostile parties.

A Clearing-House for Information.

THE paper on the above subject, read by Mr. W. J. Pearce at the last meeting of the Circle of Scientific, Technical and Trade Journalists, raised points of great interest, alike to the technical journalist and to men of science. He pointed out that the amount of valuable scientific and technical "fact-information" was rapidly increasing, and that the public appetite for such data had also grown. Yet the bulk of such information remains locked up in special libraries—often unknown to the man most in need of it. On the Continent, comprehensive schemes of indexing all available knowledge have been attempted, but we think most people would agree with Mr. Pearce that they are too complicated for ordinary life. The average man wishes to be able to get information quickly and easily. Reference was made in the discussion to the simplicity of the arrangements at the Patent Office Library, and a letter from Mr. Bradford, the Director of the Science Museum, South Kensington, was read, drawing attention to the great resources of this special library, which ought to be more widely known. Mr. Pearce explained the aims of the Association of Special Libraries and Information Bureaux, and advocated the establishment of a clearing house, where inquirers could be put in touch with the best sources of information. There are in this country many other special libraries besides the two mentioned, and it would certainly be an advantage if some method of linking them together and making their existence and resources more widely known could be evolved.

Meetings in June.

IN recent times June has become one of the busiest months in the electrical year—at least, that is how it appears to the technical Press—and this year it was to have been more crowded with events than ever; however, fate has ordained otherwise, and in a country which practically lives on coal, the lack of that commodity has necessitated drastic changes in many programmes.

The Summer Meeting of the Institution of Electrical Engineers has been postponed till next year; the annual meeting of the Association of Mining Electrical Engineers, which opens to-day, will be confined to the transaction of formal business, the social events and visits being abandoned.

However, it is satisfactory to be able to announce that the annual convention of the Incorporated Municipal Electrical Association at Glasgow, the principal event of its kind, will be held according to plan. It is true that some modifications in the lighter side of the programme may be found necessary, but up to the time of writing we understand that no change is in contemplation. The members, of course, will not expect to find that the arrangements are in every respect as perfect and efficient as the admirable record of the Association in the past would lead them to anticipate if normal conditions prevailed; the circumstances are abnormal, and have hampered the preparations of the secretarial staff, delaying the issue of the programme, but those who propose to take part in the Convention must make allowance for the difficulties which confront its organisers, remembering that a gathering of 600 or 800 people is no light matter to handle at the best of times.

The first annual convention of the Electrical Contractors' Association will be held at Brighton as arranged, and so will that of the Tramways and Light Railways Association at Torquay, in the same week. The conversazione of the I.E.E. will take place whilst both these events are in progress, and once more we have to regret the clashing of programmes of electrical bodies; apparently a sort of clearing house for conventions is needed. Not many have the leisure or perhaps the stamina to enable them to take part in a succession of summer meetings, but some would certainly wish to attend more than one. Possibly next year the difficulty will be met by the holding of one big electrical convention on the lines which we have already indicated.

Transatlantic Photo-Telegraphy.

The Transmission and Reception of Photo-Radiograms.

RECENT announcements and pronouncements would seem to indicate that the art of picture transmission has suddenly been born; whereas its inception dates from almost the same time as the invention of straight telegraphy, for in 1842 Alexander Bain, an English physicist, first proposed a device for sending pictures from one place to another electrically along wire circuits.

His idea is so basically correct, coupled with simplicity, that all later investigators have, generally, followed his method. A system devised for use on the long-distance Bell telephone network in the U.S.A., which includes very good-quality circuits, has been outlined,* and the feature at present under consideration is the utilisation of a radio-telegraphic circuit for the purpose. Apparatus has been installed in London, New York, and San Francisco for the establishment of a regular, reliable service for the transmission and reception of news photographs, facsimile printed and written documents, or tabulated matter, designs, &c., *via* the 220-mile land line from London to the Carnarvon (North Wales) radio-telegraph station of Marconi's Wireless Telegraph Co., Ltd., thence across the Atlantic Ocean to the Riverhead station of the Radio Corporation of America on Long Island, and further on by land lines.

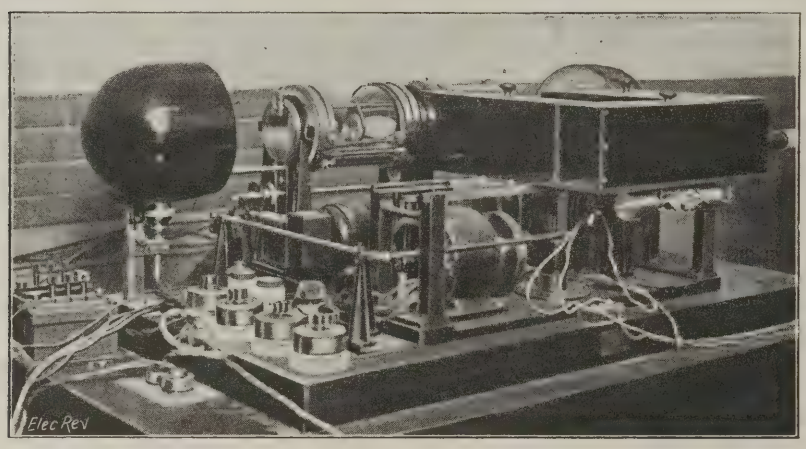

Fig. 1.—Photo-radiogram Transmitter at Radio House, London.

The basic elements of all picture transmission are, first, a synchronous action covering a surface point by point at both transmitter and receiver, and, secondly, the electrical identification of the point value to correspond between transmitter and receiver; and when Capt. R. H. Ranger, and the Radio Corporation of America, undertook the development of his system he soon realised that the solution of his main problem was an economic one rather than that of producing a machine that would work.

Practically every system is based on the division of the picture into small unit areas and the transmission of their values one after another, but when it is realised that the usual newspaper half-tone (and none too good a one at that) has, at least, 65 dots in a row per inch, or more than 4,000 of them to a square inch, the size of the job becomes apparent. Analysed in this way, the usual method of picture transmission found its serious drawbacks in the number of pulses that have to be transmitted and the precision and the time needed to do so. Search for a "shorthand" method of accomplishing the same results was then started. The first effort in this direction consisted of variable dot-spacing, making each dot of generally the same size, so that by their grouping they constituted the shades of the picture. The dots were so chosen that, in size, they would occupy a space of approximately one-fourth of the 64th of an inch (the usual newspaper standard), one such dot per 64th of an inch giving an impression of gray colour; if spaced further apart, gray would give way to white; if spaced closed together, gray would become darker, and for almost black the spacing would be approximately two dots to each 64th of an inch. An advance was accordingly made from the necessary five values of the older systems to two for each 64th of an inch; this dot concentration was carried a step further by starting with separately grouped dots in the white end of the scale and increasing to the densely concentrated dots as before, but the receiver drum is given twice the speed of the movement, so that the spacing which formerly produced black now gives a middle gray. Then, to accomplish the further deepening to the black, each of the dots grouped closely together are lengthened so that they become heavier and heavier, and finally for solid black the transmitter is held constantly. The apparatus is a balanced arrangement, such as the familiar "push-pull" type of amplifier; one side of the outfit works in progression from white to gray and the other side in the light progression from gray to black, with a slight overlap at the centre.

The reduction that is thus accomplished over the previous method is 2 to 1, so that a 5 to 1 overall improvement has been made, which means that with a fixed available speed for the transmission of individual units, the process enables five times the area to be covered in the same length of time. Furthermore, a wide range of tones is secured without abrupt changes from one tone to the next, and the individuality of the alignment of the sharp edge can be made very precise providing the synchronising of the motors is sufficiently accurate.

Fig. 2.—Capt. R. H. Ranger and his Receiver.

The photograph or document to be transmitted is copied photographically, either as a negative or positive, on to a transparent celluloid film that is mounted on a horizontal glass cylinder (to be seen in fig. 1) at one end of which a tungsten-arc lamp (15,000 c.p. per

* See ELEC. REV., July 24th, 1925; pp. 139-41.

sq. in. of surface) is housed in a dome reflector, the beam of light being directed through a system of lenses longitudinally down the cylinder on to a 90-deg. prism which directs the beam radially outwards through the film; the latter being situated at the focus of the lens system, the light passes through small areas of the film progressively, the intensity of the issuing beam depending on the density of the particular portion of the image through which it emerges. Another system of lenses and mirrors directs the light ray on to a light-sensitive cell with varying intensity according as the optical system is moved forward parallel to the film cylinder; the latter is rotated slightly at the end of each stroke so that the light ray traverses the whole picture in a series of parallel horizontal lines. The photo-cell, which interprets light valves into terms of electric current, was developed by the General Electric Co., of America, and the Westinghouse Electric & Manufacturing Co. It is of the glass-bulb thermionic pattern, and somewhat resembles a large radio valve; the basic idea of its operation is the application of a high voltage, almost sufficient to ionize it, photo-electric action being realised when light strikes the photo-cell so that the potassium hydride which lines its inside surface is ionized and electrons pass from the potassium hydride to the cathode in the centre of the cell. Highly attenuated argon gas fills the inside of the cell and increases the ionizing effect materially, so that an appreciable current flows through the cell with the action of the light (to the extent of some two micro-amperes). This current, of course, must be greatly amplified by the use of three-electrode vacuum valves; in a typical circuit, the current is caused to pass through a high resistance, which causes voltage variations to be applied to the grid of the vacuum valve. Such amplification might be carried on in further steps in the usual manner, but for the first dot-concentration plan this was quite sufficient in itself to give effective results. A vacuum valve with its grid thus controlled by the photo-cell has its plate current applied through a condenser charged at intervals, which are determined by the rate at which the condenser discharges; in other words, a sort of low-pressure valve is arranged such that when the condenser discharges to a certain extent, the plate battery is again connected to the condenser to charge it up to the maximum value. This is accomplished by having a large C battery connected to the high side of the condenser and so biased that the plate voltage must fall below a given value before a second three-electrode valve stops drawing plate current through its plate. This second plate current is carried through a relay; while the relay coil is energised the contacts are open, but when the relay falls back against the contacts the charging B battery pulse is sent on to the condenser. Thus the time interval between the successive charges of the condenser is determined by the rate of the plate-current flow in the first vacuum valve, and as this is, in turn, determined by the photo-cell current, a direct interpretation of the light action is obtained in terms of the relay closing which can be used to activate telegraph lines or a radio-telegraph circuit.

An interesting adjunct to the photo-cell is the use of an additional light beyond the normal illumination obtained through the film to be transmitted: it has been termed the C light, and corresponds in its action very much to the C battery used in grid amplification. The use of the C light makes it possible to operate the photo-cell itself more effectively, so that, in conjunction with the amplifiers, it gives a more perfect straight-line characteristic to the reproduction current values.

For synchronizing, a tuning fork gives the appropriate constant rate of rotation to actuate both transmitter and receiver; by the addition of clock check control it has been found possible to obtain uniform speeds at each end, where the clock controls act as a check on the tuning fork. Further, use is also made of dashes at the end of each stroke, which serve to keep the receiving cylinder moving correctly with respect to the transmitting cylinder.

The receiver (fig. 2) may be of various forms; in the present case it is suitable for receiving continuous-wave telegraph signals by the heterodyne-beat method and, following rectification and amplification, the received impulses are made to actuate a siphon recorder mounted on a travelling carriage that is operated by a tuning-fork controlled motor, so that its movement is in synchronism with that of the carriage carrying the optical system of the transmitter. After each stroke of the carriage the paper roll is moved forward slightly more than the width of the lines formed by the pen of the siphon recorder, the horizontal row of ink dots and dashes thus made side by side eventually completing the picture. The amplifier at the receiving end (fig. 3) includes a valve-controlled condenser similar to that at the transmitting end, its function being to overcome the inertia of the siphon recorder and render the latter's action more rapid and certain.

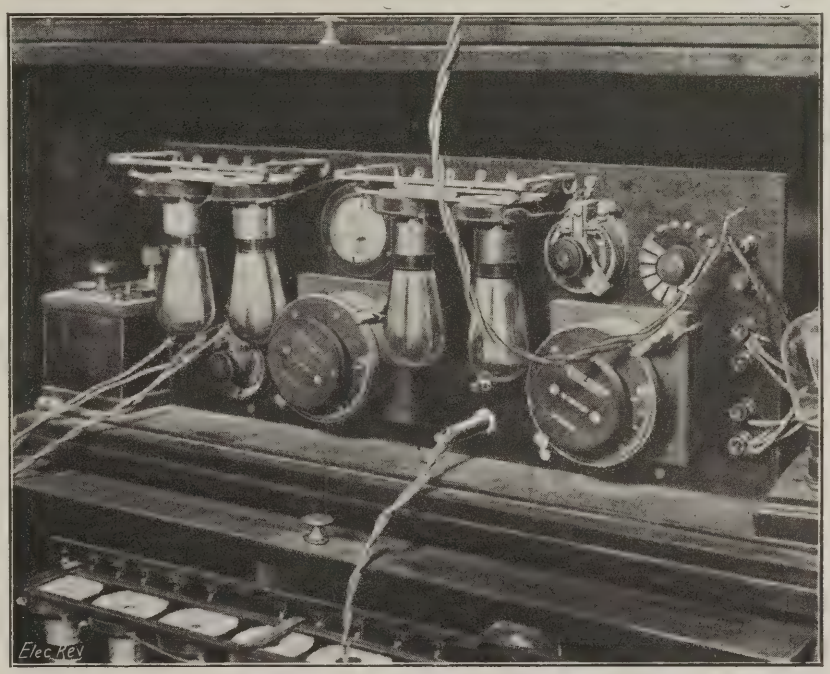

Fig 3.—Receiving Amplifier at Marconi's Main Telegraph Office.

The photogram receiver is capable of making two pictures at the same time, or duplicating one picture, and a film box may be added for obtaining a photographic record at the same time as the visible one is being made. Naturally, when the pictures are reduced in size, their artistic effect is greatly enhanced. Anything up to a photographic half-plate in size can be handled by the plant installed in London, the transmission of a picture of quarter-plate size occupying about 15 minutes.

In such a development it is natural that those who see only the general effects of the work may not appreciate the effort that had to be expended on all the details involved. Actual measurements showed that a film which varies in its ability to transmit light from 25 per cent. at the darkest portions to 80 per cent. at the lightest portions gives the best results. To organise operations on a practical basis a very extensive study of photographic copying had to be made; for example, with a given fixed original, it is possible to get a wide variation in the transparency of the copy by changing either the exposure time in the copying camera, or the development time; also it is possible to get a still wider variation by using different types of films. Such information has been drawn up in the form of a single table, so that the practical operator can obtain from any given

original the copy which will have the exact range desired.

Electrical transmission to a distance always necessitates obtaining sufficient signal strength to over-ride the effects of disturbances. It is in this respect that the telegraph wins, due to the fact that it is in a sense a trigger device, so that it is easier to identify electro-mechanically the times when the current is " on " and when it is " off," than to attempt to analyse variations in current strength. By interpreting picture values in dots and dashes (involving full current of the radio transmitter being " on " even for the shortest dot) full advantage has been taken of this telegraphic supremacy to carry a picture to the greatest distance. Furthermore, it lends itself most readily to relaying operations by means of both wire and radio circuits.

Naturally, refinements remain to be introduced to render the equipment continuously serviceable, so that both transmitter and receiver may operate without interruption between pictures; the equipment now set up is working both eastward across the Atlantic and westward to California and Honolulu, and it is only a question of time when the mechanics of the operations will have been sufficiently mastered by the operators to make photo-radiograms of service to everyone.

On Determining the Value of Earthing Resistances for Alternator Protection.

Typical and Special Arrangements are Indicated.

By B. NUTTALL, A.M.I.E.E.

THE following notes are intended to help those who are sometimes perplexed when having to decide upon a suitable value of alternator earthing resistance, and are based upon the assumption that the neutral point of one generator only is earthed. Two such typical arrangements are shown in figs. 1 and 2. In the case of fig. 1, a simple interlock is desirable, so as to prevent more than one switch being closed at a time. Fig. 2 ensures that it is impossible for the latter condition to exist. Although not indicated in these figures, the machines are connected solidly to the busbars—or else, as indicated in fig. 3, a separate resistance is furnished for each machine, as each alternator constitutes a separate and distinct system.

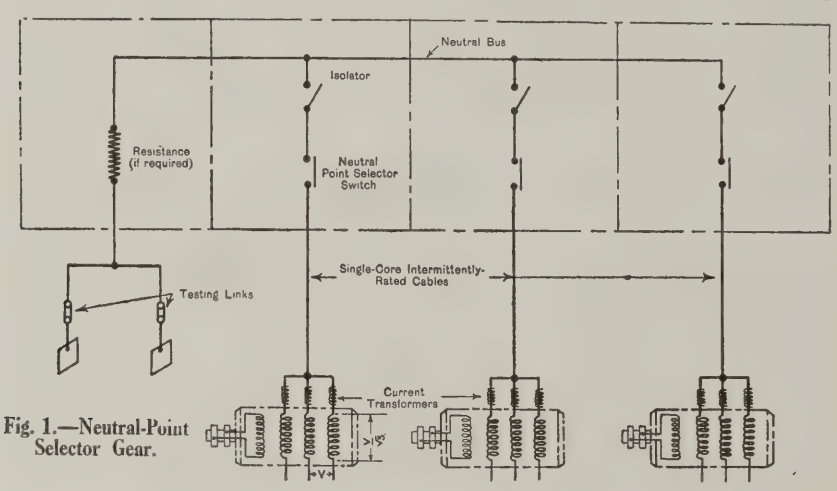

Fig. 1.—Neutral-Point Selector Gear.

For systems as indicated in figs. 1 and 2, it is the usual practice to select the neutral point of one of the largest or strongest machines, so that it may take all the stresses due to earth faults.

The object of earthing one alternator neutral point only at a time with machines coupled solid to the busbars is threefold:—

(1) To keep the resistance between the neutral point of the system and earth constant—that is, the maximum current flowing on a fault to earth—independent of the number of alternators working in parallel, otherwise the leakage current may vary over a wide range. If no resistance is employed, this method limits the value of the earth current to the capacity of one machine.

(2) To avoid interchange of triple-frequency currents between machines. Also in the event of a bad synchronising shot, to prevent a cross-current circulating between machines.

(3) To avoid multiplicity of earthing resistances.

The arrangement, however, suffers from the disadvantage that an earth fault causes a rise in potential on the neutral busbar.

The following examples assume that the machines are protected by the Merz-Price circulating-current system of protection.

Effect of Varying the Value of Resistance.

Assume that for a certain 6,600-volt, 3-phase machine, as shown in fig. 4, the circulating current relays are set to operate with 76 amperes out-of-balance across the winding. With an earth fault on terminal x, the full phase voltage is available to drive 76 amperes through the resistance, which can have a value of $6{,}600/76\sqrt{3} = 50$ ohms. Assume that the fault takes place at y, 60 per cent. along the phase winding; this permits 60 per cent. phase voltage drop across the resistance (neglecting the resistance of the earth return), thus corresponding to $50 \times 0.6 = 30$ ohms. Similarly with a fault at z, 10 per cent. along the phase winding, the limiting resistance would not have to exceed 5 ohms. This clearly shows that the value of the resistance depends upon the degree of protection desired for the generator.

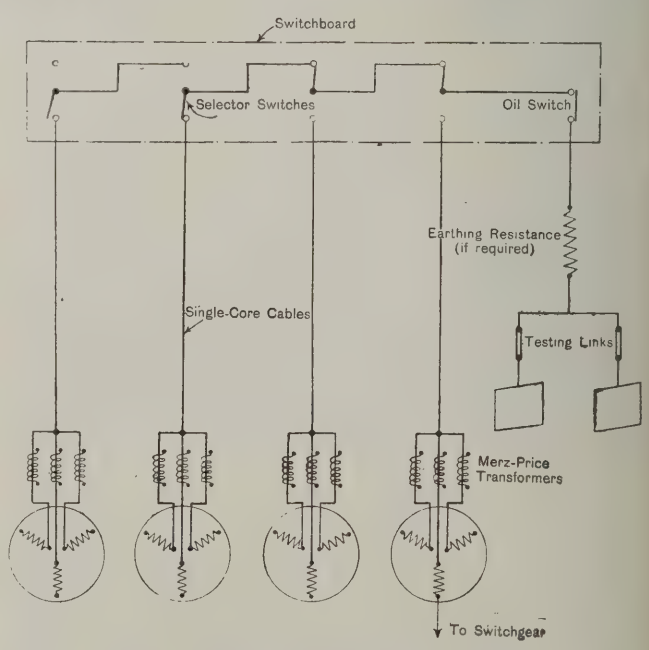

Fig. 2.—Neutral-Point Selector (Throw-over) Gear.

It will be observed that with a fault at y the full phase

voltage (v = 3,800) is impressed across the resistance for a period corresponding to the time required for the automatic field-suppression gear to reduce the field current to zero. This is only a momentary period, and as thermal capacity is not necessary in the resistance,

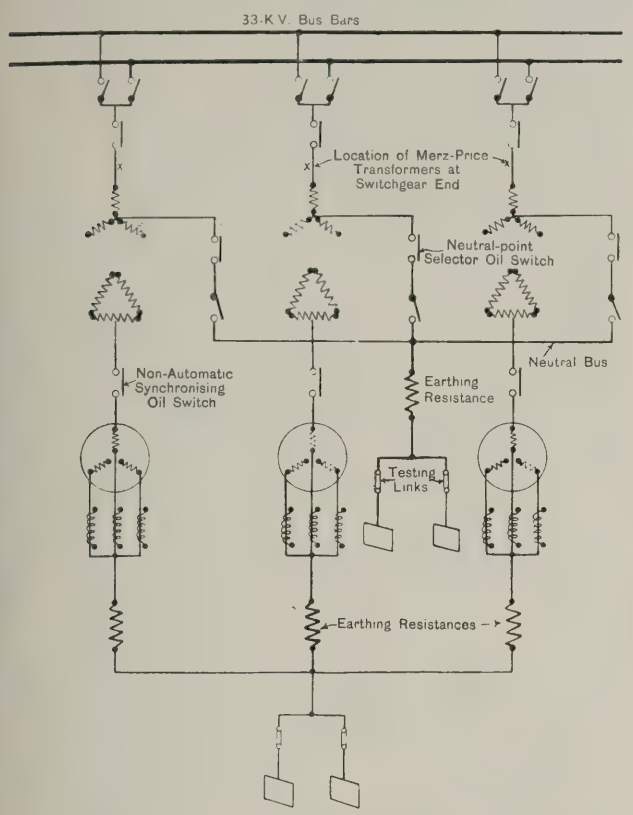

Fig. 3.—Earthing Arrangement with Separate Systems.

it is usual to design the resistance to carry the predetermined earth current for 30 seconds with a temperature rise of, say, 200 deg. C.

Varying Degree of Protection of Alternators with Limiting Resistance of Constant Value.

Not infrequently it occurs that the capacity of a power station is increased to a value several times that of the original scheme, and a review of the protective arrangements is necessary. Fig. 5 indicates such a condition, turbo sets A and B comprising the initial

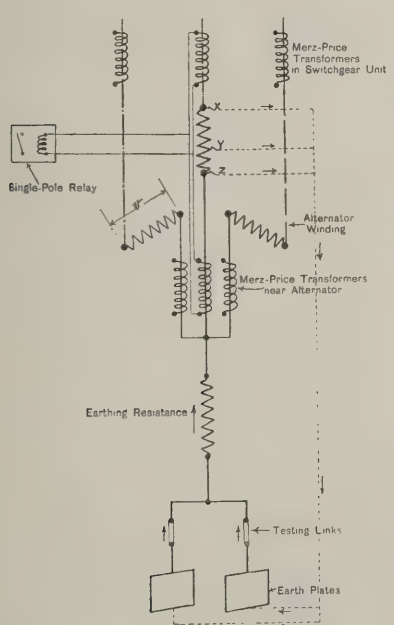

Fig. 4.

installation; set C was subsequently added, but the additional cost involved in modifying the value of the resistance preponderated over the advantage secured by the increased protection to set C. With the installation of sets E and D the resistance was re-modelled and its value adjusted to enable it to pass the normal full-load current of the largest machine, *i.e.*, 1,000 amperes with normal phase voltage impressed across it. In the following examples the original value of the resistance is retained so as to indicate the varying degree of protection afforded to the different sizes of machines.

Assuming that the limiting factor is the degree of stability of the protective transformers obtained, a relay setting of, say, 0.93 A will be taken to ensure that the relay will not operate with a straight-through current equivalent to twenty times normal full load.

The original resistance was designed to pass 300 A for 30 seconds, which corresponds to a resistance of $3,800/300 = 12.66$ ohms.

Machine A.—With 250/5A protective transformers, *i.e.*, 50/1 ratio, the corresponding primary out-of-balance current is $50 \times 0.93 = 47$ amperes.

The unprotected portion of the winding would now be $12.66 \times 47 \times 100/3.800 = 15.7$ per cent., *i.e.*, a protected portion of $(100 - 15.7)$ per cent., or 84.3 per cent.

Machine B.—The transformer ratio is 60/1. The primary out-of-balance current in 55.8 amperes, implying a drop of $55.8 \times 12.66 = 706$ volts across the resistance. Thus the unprotected portion is $706 \times 100/3,800 = 18.6$ per cent., giving a protected portion of 81.4 per cent.

Machine C.—Similarly the unprotected portion is $941 \times 100/3,800 = 25$ per cent., giving a protected portion of 75 per cent.

Machines D and E.—Similarly for each of these machines the unprotected portion is $2,360 \times 100/3,800 = 62$ per cent., giving a protected portion of 38 per cent.

By employing the M.V.E. modified Merz-Price system (S. L. Pearce's patent) and retaining the same value of limiting resistance, more favourable conditions are secured. With this system a much lower relay setting may be employed. Assuming a setting of 0.35 A, the unprotected portion of machines D or E would now be reduced to $886 \times 100/3,800 = 23.3$ per cent., giving a protected portion of 76.7 per cent., as compared with 38 per cent. with standard Merz-Price gear.

The following indicates how the same results may be obtained by employing a formula:—

Let v = Phase voltage.
i = Normal-load current of generator.
i = Primary out-of-balance current.
a = Relay setting = Primary out-of-balance current/normal load current $\times 100 = i/\text{I} \times 100$ per cent.
I_e = Maximum earth current.
R = Ohmic value of resistance.

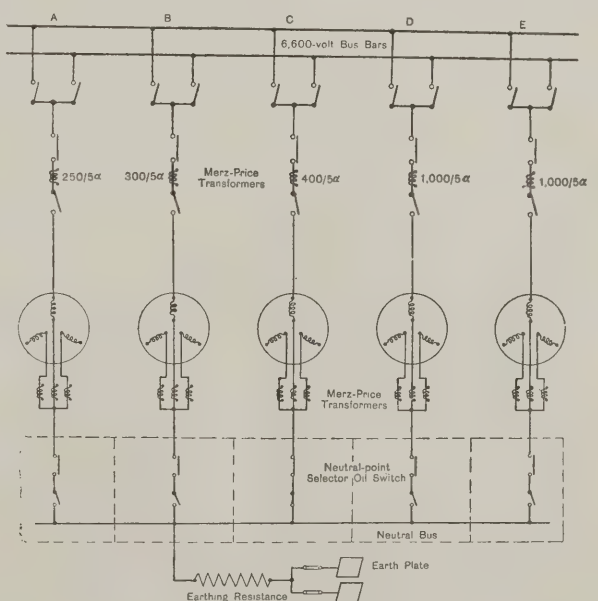

Fig. 5.

Percentage of winding unprotected = $\text{R} \times i \times 100/\text{v}$, but $\text{R} = \text{v}/\text{I}_e$ and $i = a\text{I}$.

∴ Percentage of winding unprotected = $100\ a\text{I}/\text{I}_e$.

∴ Percentage of winding protected = 100 (1 − relay setting × normal load current/maximum earth current) or winding protected = 100 (1 − out-of-balance current/maximum earth current).

Assuming that as an average value $a = 15$ per cent. for

standard M.-P. gear and 7 per cent. for the modified system, the protected portion of the winding can now be readily arrived at for varying values of the resistance so that a suitable value may be selected:—

A Percentage of winding required to be protected.	B % relay setting (*a*).	C Load current/max. earth current = 1/1
85	15	1
70	15	2
45	15	3
92	8	1
84	8	2
76	8	3

The figures in column A are obtained, as shown above, from the formula by mutiplying those in columns B and C and subtracting from 100.

The percentage of generator winding protected may be more readily obtained by plotting the primary out-of-balance (*i*) or leakage current in amperes as the ordinates and the maximum earth current (I) as abscissa, as indicated in fig. 6. Should the out-of-balance and earth-current values exceed those indicated, the curves may still be used by referring to both ordinates and abscissa as a percentage of the normal load current. The resistances of the fault and ground return are neglected.

Whilst determining the most suitable value of resistance when referred to the generator protective gear, it must not be overlooked that occasionally this value may have to be increased to ensure operation of the feeder protective year. If the latter embodies leakage protection, which even with a direct trip set, say, at 25-30 per cent. normal load, the resistance would be quite large enough for this purpose if it permitted 50 per cent. of the load current of the largest feeder to pass. If, however, plain overload protection only is provided and it is desired to protect against earth faults as well as phase faults, the resistance will have to have such a value as to permit the operation of the breaker on the largest feeder when the trip gear is at its maximum setting, unless fused trip coils are employed.

It sometimes may happen with a large-current low-voltage machine that economical considerations may permit only of the employment of direct tripping Merz-Price gear and connecting the neutral point solidly to earth. If a resistance were employed in such a case to pass the full-load current of the machine, the cost would be prohibitive. Such a case is shown in fig. 7, where a 1,000-kW, 3-phase, 350-volt generator composed the initial installation, and on extensions being necessary it was decided to generate and transmit at 6,600 volts, thus necessitating a step-up transformer for the low-voltage machine. With the arrangement indicated, the neutral of the second system (6,600-volt) could be selected from either of the direct-coupled machines or from the secondary side of the generator-transformer circuit. As is customary, the resistance for this system was designed to pass approximately the full-load current of the largest machine with full phase voltage impressed across it—*i.e.*, 150 amps.

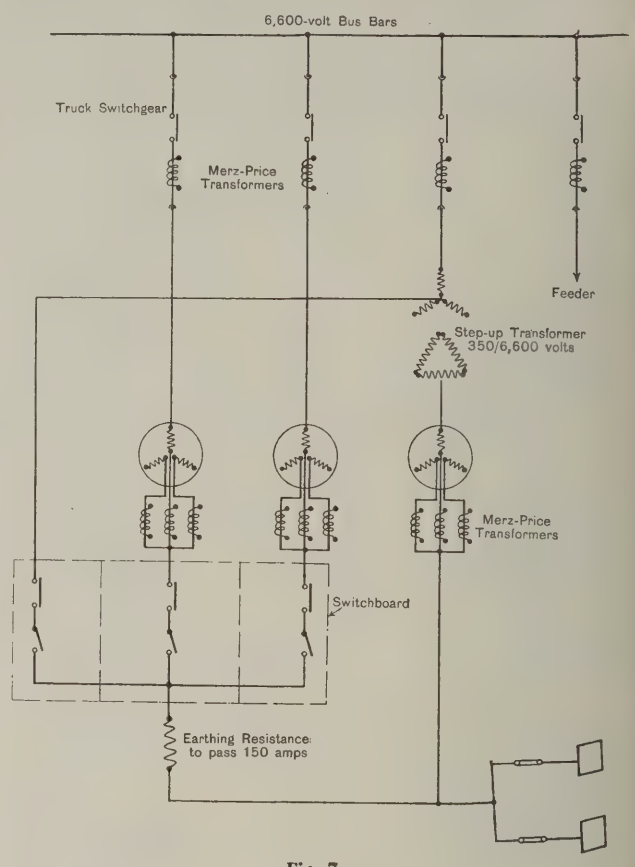

Fig. 7.

It may happen that a section of the system is found wherein no neutral point is available for connection to ground. In such a circumstance, to ensure uniformity of the operating conditions, special provision has to be made, an artificial neutral point being generally provided. Although this requirement may be met by using a transformer adapted for star connection to that side of the system and connected in delta on the secondary side, it is more usual to provide a three-limbed reactor having two coils in each limb, which coils are connected in zig-zag formation, as shown in fig. 8. Full particulars of this "zig-zag" transformer may be obtained on referring to the "J. & P. Transformer Book" by Messrs. Stigant and Lacey.

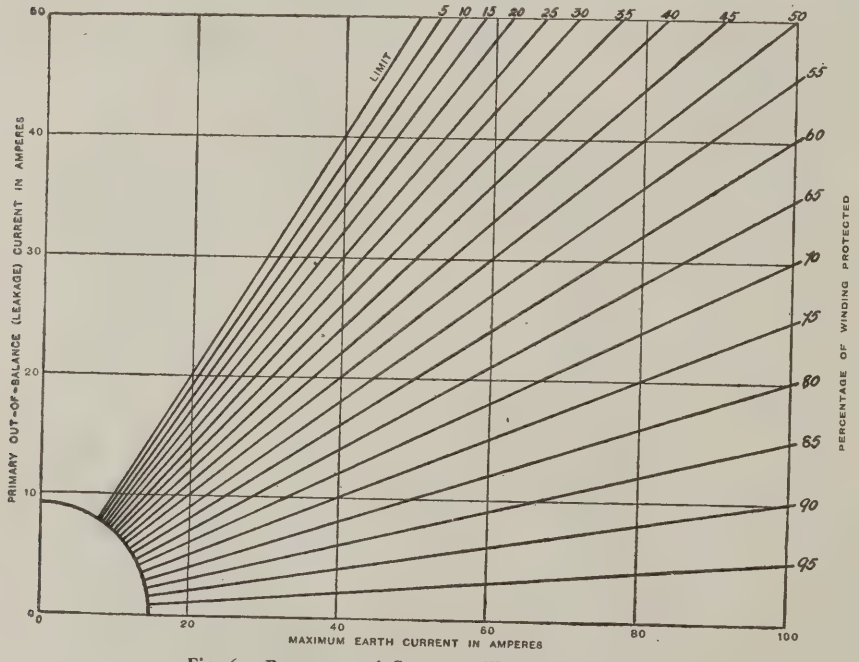

Fig. 6.—Percentage of Generator Winding Protected.

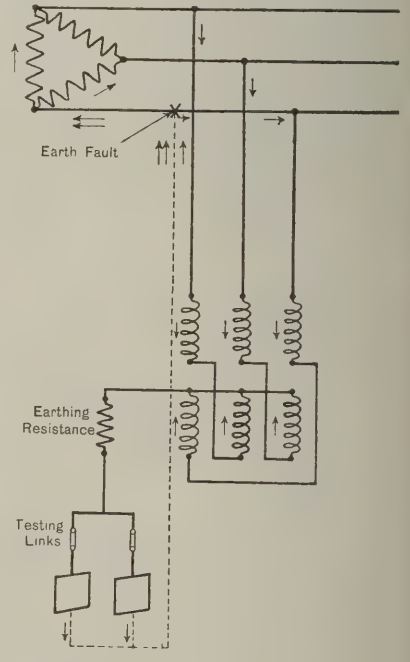

Fig. 8.—Zig-zag Transformer Formation.

The I.E.C. Meeting in America.—IV.

A Cursory Account of the Proceedings.

By PHEIDIPPIDES.

A NUMBER of recommendations are being made to the National Committees in the domain of graphical symbols for telegraph, telephone, and radio diagrams, in connection with which it is hoped that agreement will be reached in favour of definite adoption at the next session of the I.E.C.

The Advisory Committee on Terminal Markings, under the chairmanship of Dr. Strecker (Germany), was only able to review the present practice in various countries in a general way.

The question of obtaining international agreement is an extremely difficult one, since each country has already adopted the scheme which appears most to meet its particular requirements, and to make any change would be an expensive process and one liable to lead to confusion in the interim. However, the importance of international agreement is fully recognised, and it is hoped that by the time of the next meeting of the I.E.C. it may be possible to report a definite step forward in this matter.

The first decision of the Rules and Regulations Committee working under the chairmanship of M. Uytborck (Belgium) was to confine all discussion to overhead lines, underground construction being deferred to a later date. The Belgian Delegation, in accordance with decisions formed at a previous I.E.C. meeting, had prepared a draft set of standard rules. The German delegation circulated schedules showing the various rules and regulations in force in Germany, along with a proposed standard code.

The British delegation put forward proposals which supported generally the Belgian draft, and, in addition, suggested a method by which it would be possible for all countries to base their requirements, as regards the construction of wires and supports, on a simple formula containing a coefficient to meet the climatic conditions in the various countries in place of the various present methods of arriving at the design in different countries.

The British proposals, which were advanced by Mr. Ll. B. Atkinson, were at first subjected to considerable adverse criticism, but the discussion removed misunderstandings, and the merits of the system were recognised to such an extent that agreement was reached on the desirability of preparing standard regulations.

The Belgian Committee was instructed to obtain particulars of the regulations in force in all countries supporting the I.E.C., and on that information to formulate proposals for international agreement.

A council meeting was held at the close of the technical sessions on April 21st to discuss various matters of internal organisation, including the question of the election of the president. It was found necessary to bring the Statutes of the Commission into line with modern requirements, as they had not been modified since laid down in 1906.

Signor Semenza was unanimously re-elected president of the Commission, a decision which will receive world-wide support. Colonel Crompton, who has been the honorary secretary of the Commission for so many years, was promoted to honorary president, and Sir Richard Glazebrook was nominated as honorary secretary, which, in view of his forty years' experience of international work, is a happy augury for the future work of the Commission.

The question of revising the Statutes was referred to the Committee of Action in order that it might prepare definite proposals for the consideration of the various national committees. The Committee of Action will also be called upon to co-operate with the new international organisation on standardisation.

The Council does not, of course, deal with technical matters, so that the decisions of all the technical committees were referred to the final plenary meeting held on April 22nd by the individual chairmen, and in all cases were ratified.

The work of the Committee of Action since its inception at the Paris meeting was also ratified. It will be recalled that the Committee of Action was appointed by the Council to meet and consider important matters during the intervals between the general meetings and to keep the national committees informed.

A meeting of the Committee of Action will be held in Europe during the next few weeks to consider representations formally received from the new International Standardising body for close co-operation. This request was presented to the Committee of Action by Mr. C. E. Skinner, the chairman of the National Conference, Mr. Enstrom (Sweden), and Sir Richard Glazebrook (Great Britain).

Close co-operation between the I.E.C., now in being for more than twenty years and acknowledged by Governments, and the new body will have a far-reaching information and promulgation of international agreements, and the new body will have a far-reaching effect. A criticism has been levelled at the International Conference as being a hole-and-corner affair,* as it is obvious to anyone having experience of such meetings that the freedom of discussion necessary to come to an understanding would have been impossible at a public meeting.

The Conference, which has assumed formal shape in New York, is not the result of a sudden thought, but is the culmination of a series of deliberate steps originating with the national standardising bodies, which in most countries are supported by the industry as a whole.

The wonderful hospitality extended by the American reception committee to the visiting delegates throughout the New York meetings was brought to a fitting climax by a banquet at the Hotel Astor during the second week, when the Mayor of New York welcomed the Commission. Felicitous speeches were made by Signor Semenza (Italy), Monsieur E. Mytborck (Belgium), Professor Feldmann (Holland), M. Domingo Santa Maria (Chile), M. E. Huber-Stockar (Switzerland), Sir Richard Glazebrook (Great Britain), Dr. John W. Lieb (U.S.A.), and Professor Luigi Lombardi (Italy).

Later in the week the delegates tendered a dinner to the United States National Committee, under the presidency of Dr. Guido Semenza. In complimenting the committee on the remarkable kindness and thoughtfulness displayed in every detail of the arrangements for the Conference, Dr. Semenza mentioned specially the names of Dr. Lieb, Mr. Frank W. Smith, and Dr. Clayton Sharp. As a token of the delegates' appreciation of their magnificent reception, the president presented, on their behalf, a delightful souvenir of the visit in the form of a bronze copy of the well-known ancient statue of Victory, in Naples.

On Friday, April 23rd, the serious work of the Conference being completed, the delegates, accompanied by a number of American and Canadian hosts, started off on a 3,000-mile tour of inspection, covering the principal cities in the Eastern States and Canada. A special train of up-to-date sleeping cars had been placed at the disposal of the party, and this remained their headquarters during the twelve days' trip, most of the travelling from point to point being done during the night, leaving the days free for sightseeing.

The first city visited was Philadelphia, with its historic Hall of Independence meaning so much to the

*Because the Press was not allowed to be present at the discussions.

American nation. The party took tea in the Franklin Institute amid many interesting relics of the early days of electrical discovery. The Philadelphia Electric Co., whose chief engineer is Dr. L. Eglin, also president of the Franklin Institute, provided the entertainment for the guests, and this first day of the tour showed that there was to be some competition between the reception committees of the various towns to give the visitors the best possible time.

Washington, with its delightful lay-out and magnificent buildings, was reached at 7 a.m. on Saturday, April 24th, and for the short time available a full and interesting programme had been arranged. After visiting the Capitol and beautiful Library of Congress, the delegates were received by President Coolidge at the White House. The President shook hands with each delegate, and then kindly posed while the amateur photographer in the party "snapped" him.

Luncheon was provided at the Bureau of Standards, under the presidency of Dr. G. K. Burgess, and the afternoon was devoted to an inspection of the extensive laboratories. At the evening function, provided by the Washington Society of Engineers, the principal speaker was Mr. Hoovar, the State Secretary for Commerce.

Sunday, April 25th, was occupied in travelling by daylight through the remarkable Blue Ridge Mountains, along the River Potomac, and through Virginia and Maryland. This part of the country is full of historical associations of the French, Indian, and Civil Wars, and after an interesting journey the party arrived at Pittsburgh, the centre of the steel industry, to be welcomed by the local electrical representatives, under the chairmanship of Mr. T. P. Gaylor, of the Westinghouse Co.

On the Monday morning the party, after proceeding by river steamer to McKeesport, and thus having an excellent opportunity of viewing the vast industrial development of this important centre, lunched at the East Pittsburgh works of the Westinghouse Co., and afterwards inspected the hundred-acre factory. During luncheon the delegates were entertained by the KDKA orchestra, so famous in connection with transatlantic broadcasting.

Later in the day the party visited the Carnegie Institute, that magnificent centre of culture founded by Andrew Carnegie, the steel king, and after a dinner, presided over by Col. Samuel H. Church, rejoined the special train which was to convey them during the night to Chicago.

The competitive element in the entertaining was very clearly marked in the lavish and thoughtful reception accorded the Commission in this metropolis, which is the "beginning of the West." A wonderful programme of visits and entertainment had been arranged by the Commonwealth Edison Co., and when the day of sightseeing and speech-making was brought to a close, a daintily-conceived little surprise was sprung on the party. At the conclusion of an excellent musical comedy in the principal theatre in Chicago, an Indian chief came before the curtain and, in an admirable poem, welcomed the I.E.C. to his country, lauded its peace-making activities, and bade the party God-speed on its journey to other cities. The train left Chicago at 11 p.m. for Detroit.

The Ford works formed, of course, the principal venue in Detroit, and after admiring the working of that remarkable organisation and wondering possibly where such intense industrialism was leading humanity, the party was entertained by the Detroit Edison Co., saw its boulevards and power stations, and then moved across the river to Canada.

Niagara Falls was reached late the same evening, but not too late to prevent many of the delegates walking the few hundred yards to get a first glimpse of the swirling and tumbling waters in the moonlight before retiring. The Hydro-Electric Power Commission of Ontario and the Niagara Falls Power Co. combined to arrange an interesting programme of sightseeing and entertainment under the chairmanship of Mr. George S. Anderson. The various hydro-electric stations of international reputation were inspected, and the full beauty of the falls and gorge exhibited both by daylight and high-power flood lighting.

From Niagara the party moved on to Toronto, and after a short tour of the city it was entertained to dinner at the University, where the *bonne bouche* was a delightfully entertaining and witty speech made by Sir Wm. Muloch, K.C., the chief justice of Ontario. Leaving Toronto at midnight, Ottawa was reached early on Saturday, May 1st. There the Commission was received at the Parliament Buildings by the Speaker of the House of Commons of Canada, the Hon. Rodolphe Lemieux, K.C., LL.D. A pleasing little function followed, at which Dr. Semenza presented, on behalf of the visitors, a copy of the Head of Minerva. This was accepted by Dr. Barnes for the Canadian National Committee of the I.E.C. Several hydraulic plants of considerable interest and importance were inspected.

Sunday, May 2nd, was spent in Canada's commercial metropolis, Montreal—the morning in seeing and appreciating the natural beauties of this delightful city, and the afternoon in inspecting many interesting scientific and historical items in the McGill University. The work of Dr. Barnes, in his study of the ice in the St. Lawrence River, and the magnificent natural-colour photographs exhibited by him, were the cause of considerable comment.

During the night the party travelled to Boston, Mass., where a wonderful day was spent in visiting the Lynn works of the G.E. Co., the Massachusetts Institute of Technology, Harvard University, and the magnificently-equipped industrial Research Laboratory of the Simplex Cable Co. The Boston reception committee had a difficult task before it in entertaining the delegates so late in a tour on which so many wonderful things had been seen; but with its ample resources the difficulties melted. No day of the whole tour was so full of interest and kindly hospitality as the one spent in this city of Oliver Wendell Holmes and so many others whose names mean so much in American science and culture. The day so full of variety, entertainment, and instruction, was brought to a fitting close by an exhibition of a number of films, one showing the delegation arriving at Boston in the morning, and others illustrating the phenomenal rate of power development in the United States.

On Tuesday May 4th, the special train brought the party to its last objective, Schenectady, and the day was spent in a very complete inspection of the works and research laboratory of the General Electric Co. The entertainment was under the direction of Dr. E. W. Rice, and after a full day the delegates welcomed a night in a real bed. On the following morning the party moved off on the last stage of the tour, which consisted very suitably of a steamboat trip down the Hudson to New York. All agreed that this was a fitting finish to thirteen really strenuous days, and by the end of the week America had said good-bye to the European delegation, which was soon speeding eastward once more. Every one of the ninety delegates had the satisfaction of knowing that, as he returned to his own country and separated from this Electrical League of Nations, he had made many real friends, whose native tongue was not his own. The Conference had achieved great things in its official meetings, and by its personal contacts had done good work in cementing the engineers of the world into a common brotherhood.

Electricity in Farming.—According to the *Implement and Machinery Review*, about 90 farms are now using the Chester Corporation electricity supply for lighting, heating, cooking, ironing, vacuum cleaning, corn crushing, root cleaning and cutting, chaff-cutting, water pumping, wood sawing, and other tasks coming within the same category. Electric light in outbuildings has been found to expedite operations. Village craftsmen also make use of the same power, village institutions subscribe to the service, and in one village every house is using electricity. Even village streets and roads are illuminated by it. All this has been achieved without incurring a loss.

Hydroelectric Power on the Lower Isere.

The First Transmission in France at 120,000 Volts.

By T. RICH.

(*Concluded from page* 798.)

Transmission Line.

One of the reasons for the construction of the Basse-Isère station was the desire for an alternative and, so to speak, co-operating supply to the area round St. Etienne and Saint-Chaumond to work in connection with water power developed on the slopes of the central plateau.

A 60,000-V line, 93 miles long, to transmit 15,000 kW, was constructed before the war between the valley of the Romanche, near Grenoble, and St. Chaumond. Owing to the satisfactory results obtained with this line, and the increasing demands for power, it was decided to build the new station on the Isère. Part of the power supplied is used by the Loire et Centre Electrical Company and part by the Steel and Forge Company, of Homécourt, at Saint Chaumond. The supply was commenced in June, 1922.

From the station to Saint Etienne the length of the route is 43½ miles, and from the latter point to Saint Chaumond, a further 7½ miles. As the two companies purchasing power were connected with other water power interests with which it was desired to operate at times in parallel, it was decided to construct two separate transmission lines running parallel at a distance of 46 ft. apart, and arranged so that the two lines could be run separately or in parallel as desired; it was found that there would not be a great advantage from the point of view of first cost in running both lines on the same support, and that if this was done it would be much more difficult to obtain a safe and symmetrical arrangement of conductors. Moreover, the arrangement adopted allowed one line to be shut down when required.

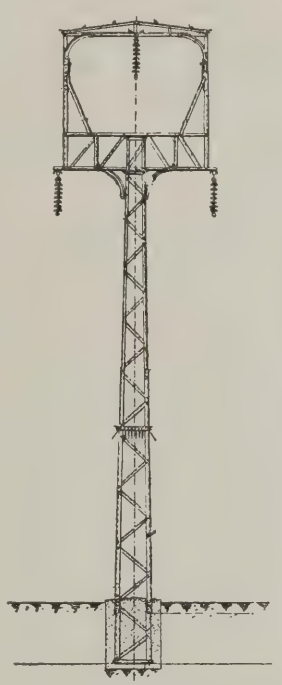

Fig. 10.—Line Support.

On the route to St. Etienne the line rises to 3,836 ft., and on the section on to Saint Chaumond 2,450 ft.; the line is double to the former place, where a 120,000/30,000-volt switching and sub-station exists, and single on to the latter, where the pressure is also reduced to 30,000 volts.

The line passes through several forests; where the line is double a clearance is made 50 yards wide, and with a single line 22 yards.

The supports for this line, which runs cross-country the whole way, are of a new type, fig. 10, patented by the Société Générale d'Entreprises, of Paris; it is designed so that the conductors can be placed in an equilateral triangle, an arrangement which minimises disturbances on neighbouring telephone and telegraph lines and reduces tendencies to surges. The bending moment about the base is reduced, as compared with supports with one conductor on one side and two on the other. The three conductors are suspended in three well-spaced vertical planes (8.3 ft.), which minimises the danger of short circuit when a sudden fall of snow from a conductor gives rise to a whipping motion. At first sight one would think that the enclosure of the top conductor inside a steel frame support would give rise to electromagnetic losses, but tests carried out on the line have shown no trace of the existence of such losses.

On normal line supports the top conductor is suspended at a height of 56.4 ft., the two lower at 42 ft. At the base the four angles of the upright are placed 3 ft. 7 in. apart; the angle steel is $2.75 \times 2.75 \times .275$ inches, with the top half angles $2.36 \times 2.36 \times .23$ inches.

The total height is 51 ft. 11in., of which 6 ft. 6¾ in. is in the ground. The total weight of each support is 1.360 kg., or nearly 27 cwt.

The terminal posts are designed to resist a breakage of the three conductors; they are similar in type to the others, but are stiffened up and weigh 2.185 kg., or 43 cwt. In the district where the line passes over high ground, where great difficulty was foreseen from the formation of ice on the conductors, the supports are still further strengthened; they weigh 3.205 kg., or about 63 cwt.

When crossing railways or telephone lines, angle brackets, fig. 7 (p. 797), are fitted projecting in the direction of the conductors, so that if a conductor broke it would be earthed at once.

Fig. 11.—Installing Suspension Insulators.

For the crossing of the River Rhone with a span of 245 metres (268 yards), the three conductors are arranged in a horizontal line; they are supported at a height of 24 metres above the ground. The supports in this case weigh 8½ tons each. The foundations were protected to resist the action of floods.

Insulators.

The Société Générale d'Entreprises, the contractors responsible for the design and construction of the line, chose insulators of the Hewlett type; they have the high breaking strength of 6 tons, and in case of breakage of an insulator they do not let the conductor down. With single suspension seven insulators are used, double suspension being used for the crossing of railways; for telephones and power lines, seven or eight

insulators are used; and for the Rhone crossing two sets of eight insulators in parallel. Fig. 11 illustrates the fixing of the insulators.

Conductors.

The conductors are of aluminium steel, and each has seven wires, 4.31 mm. diameter (about No. 7 s.w.g.), of total diameter 13 mm. (0.511 inch). The breaking strength is 2.65 English tons; weight 364 kg. per km., or 1,290 lb. per mile. In the upland district, where intense precipitation takes place owing to the peculiar conditions of ice, cold, and fog which exist at times, and where it has been found that ice can form round the cable, making a sleeve nearly 4 inches in diameter, a cable is used of 37 conductors and 15.8 mm. total diameter (.62 inch), with a total weight of 570 kg. per km., or 2,020 lb. per mile, with breaking strain of 4.18 tons. On this section the spans were limited to 80 metres, with a drop of 4.5 metres at 45 deg. C. The conductors are in an equilateral triangle 5.08 metres a side, about 16 ft. 8 in. apart; this allows of ample oscillation for the conductor. The earth wires are of galvanised steel of 50 sq. mm. section; they are attached to one of the top corners of the supports and fixed by means of a clip. The normal spans are 140 metres (153 yards); in special positions spans up to 220 metres have been adopted.

Four section stations are installed along the line so that, by means of links, any section of the line can be cut out for the repair of any damage, and further various combinations of conductors can be used. At each section station the conductors are rotated in position, and to avoid mistakes, the posts of one through line are marked with odd numbers, and the other with even. For the construction of the line, owing to the absence of railway communication on the route followed, extensive use was made of motor lorries for the transport of the necessary materials, the line supports being carried with the aid of two-wheeled trailers.

Experience since 1922 has shown that the precautions taken in the region where ice-cold fogs were prevalent were by no means excessive, and that the adoption of short spans for such sections and conductors of special breaking capacity was justified; in fact, at some particular points a deposit of ice 20 cm. (7.8 in.) thick has been experienced.

The engineers of the power company realise that, owing to the study of conditions ruling in each section of the work, it has been possible to design the line accordingly. At some points, under severe conditions of irregular strain due to ice deposits, the supports have shown signs of bending, but as the elastic limits were not exceeded, they recovered on the removal of the strain. Up to now, apart from wilful damage from gun-shot or the throwing of stones, the insulators have given no trouble, and despite extraordinarily difficult conditions, there has been no interruption in the service. The work at the power station and on the line strikes one as being of a high-class character.

Thanks must be given to the Basse Isère Company, and especially to the resident director, for information and illustrations, and thanks are due to the several contractors mentioned in the text for assistance and for the photographs used in the preparation of these notes.

Municipal or Company Trading.

Its Bearing on the Electricity Scheme.

By F. PEAKE SEXTON, A.R.C.S., A.M.I.E.E., Member Institute of Engineering Inspection.

The question of municipal *versus* private trading is to-day one of the most talked-of problems, and new facts, or even old facts presented in a new way, are likely to be both interesting and instructive. It is for this reason that the writer is presenting some data obtained primarily for a consideration of the new electricity scheme. It is, of course, admitted that even many opponents of municipal or rate-aided trading are prepared to allow that electricity supply forms a very fitting outlet for municipal activities, and the justice of this should be evident from the information here presented. Talking of "Rate-aided trading," the question arises, why not "Trade-aided rates?"—a phrase which the writer has never heard, it being generally left to an assumption that the trading is not successful. It is not fair to bias the mind in one direction before the facts are adjudged, although this is the usual method of dealing with a problem of a political nature, where in general the cry is "party," be it right or be it wrong. Nevertheless, the question is here brought forward in the scientific spirit, where the only party is the community, the right solution being the greatest good to the greatest number.

The word "community" is not to be taken as in any way connected with Communists, a body that has adapted a useful word to a special code of politics. Let the reader carefully consider this policy before reading further, and bear in mind that it is non-party, neither Conservative, Liberal, nor Labour.

The working costs of various supply stations are tabulated in Table I in accordance with the capacity of the plant installed, the municipal- and company-owned stations being separated. The charges for repayment of loans are very severe on municipal undertakings, and although companies do allow for depreciation, it is often inadequate; on the other hand, the municipal repayment is a handicap to municipal cheap production, but at the same time it is commercially a very sound policy.

The figures given are all for public supplies of electricity, and all stations are included for which returns are available.

Table I.

Mean size of plant in kilowatts.	Total cost of generation per unit, in pence. Municipal.	Company.
250	3.31	5.18
750	2.43	3.06
1,500	2.23	2.11
3,000	1.62	1.90
6,000	1.48	1.99
11,500	1.07	2.41
22,500	0.97	0.80*
45,000	0.81	1.27
90,000	0.62	0.98*

*These returns are based on only one station in each case.

Column 1 gives the average capacity of the station; 2, the average cost of municipal production; and column 3 the corresponding figure for company generation.

The cost of generation is affected by local conditions, nature of the plant, and the load factor among other matters, but as these figures are in most cases the mean of many stations, the costs are really comparable.

The results are not what the writer expected, as he anticipated for company stations a lower cost of generation with a higher profit per unit sold. Yet with only two exceptions the costs are higher, and in one of these cases there is only one station in the returns of com-

pany workings from which the average is obtained. In these cases it is only fair to point out that local conditions may have made the costs low, and in some cases the stations are partly buying in bulk and thereby confusing the costs. On the whole, this should lay to rest those tales of municipal waste and extravagance.

Turn now to Table II, where the profit per unit sold is shown both for the municipal and company undertakings cited in Table I.

Table II.

Mean size of plant in kilowatts.	Profit charged per unit. Municipal.	Company.
250	2.12	3.06
750	1.77	3.15
1,500	1.84	2.03
3,000	1.27	2.08
6,000	1.15	1.80
11,500	0.87	2.66
22,500	0.79	0.77*
45,000	0.75	1.40
90,000	0.70	0.58*

*These returns are based on only one station.

Here is shown the much higher profit demanded by the company than the municipal stations, specially in the smaller ones. In fact, in only two instances is the profit less in the case of companies, and here it is only fair to mention that the figures refer to one station in each case, and not an average. In the case of stations of about 750 kilowatts, the excess charged by the company stations is 1.38d. per unit, or nearly 80 per cent.; and, again, in the case of the 45,000-kilowatt stations the results are similar.

The figures given above are in all cases averages, and as the judgment of the results must depend on the number of stations considered, Table III gives the number of stations from which the two previous tables were obtained.

Table III.

Mean size of plant in kilowatts.	Total number of stations. Municipal.	Company.
250	12	47
750	17	26
1,500	32	3
3,000	25	8
6,000	37	4
11,500	29	2
22,500	28	1
45,000	12	5
90,000	5	1

These figures show that for the 250-kW stations there are four company undertakings to every municipal one, whereas in the case of 90,000-kW stations the figures are reversed. Very many of the small stations are subcompanies of some large Corporation, a fact that should tend to economy, but which nevertheless has not brought the cost down.

A careful consideration of these figures must result in an agreement that the municipal stations are able to produce electricity at a lower rate, and are willing to sell it at a lower profit, than the company stations.

In conclusion, it may be pointed out that although the advantages of municipal stations have been shown, this does not give support to the Government electricity scheme, as Table I shows that there is little difference between the "super" and the large stations. In some individual cases, smaller stations are producing at lower rates than the super-stations, so one might suggest the suitable selection of the station rather than size, but it appears that the latter is the main factor in the scheme now before Parliament.

On Applying for a Job.

By "JUDEX."

It has been my lot on many occasions during the last 20 years to sift out applications for advertised engineering posts, to recommend names for a "short leet," and (either alone, or as a member of a selection committee) to interview candidates and make the final choice. None of these things are easy. Some applicants, who would perhaps suit admirably, never get a chance because they do not know how to apply; others, palpably useless when seen, get selected for interview because they have the knack of stating their cases well; between are those who are interviewed, perhaps, for no other reason than a scarcity of candidates, and then turn out to be men of character and ability beyond what their papers would lead one to expect.

It may cost a shilling or two to get an application typed on good paper. Perhaps one ought not to be prejudiced by such a detail, but attention to it shows an orderly mind in the applicant and ensures legibility. For copies of testimonials, either printing or type should be the invariable rule, for no one will willingly wade through hand-written copies. Nevertheless a sample of handwriting should be worked in, preferably in a covering letter to the formal application; since, whether there is anything in graphology or not, most judges of character are in fact influenced by it. A man who cannot keep his lines straight is not likely to be neat in other respects; one who finishes his letter at the side or the top to save a sheet gives a glimpse into his mind. Among a batch of applications are generally some in which the grammar or spelling shows defects of general education which may be fatal for superior posts abroad, especially among natives; for the brown and yellow races are quick to recognise the mechanic who is not a "sahib" but is in a sahib's job. Avoidance of such errors may lead to the "short leet," but a minute's interview will, of course, prove if the candidate will do or not.

If the applicant's nationality is asked it is prejudicial to say "British subject" if in fact the man is also a Maltese or a Eurasian or a Hottentot. To omit to give a father's profession when it is asked for is a tactical error; many a shopkeeper's or drummer's son is a public school man and a first-rate engineer.

In recent years I have noticed that not 1 per cent. of those to whom it applies use the term "chartered (civil or electrical) engineer." Also, those with war service omit to state in what branch of the services they were or in what countries they served. Good war service, other things being more or less equal, is a qualification in itself, at least for the public service.

Young Indians, who go to America and come to England in increasing numbers for training, almost invariably concentrate on a sheaf of personal testimonials to character from their relations and friends who have attained high office; they also frequently apply for an immediate interview, in the hopes of getting a bulge on their competitors. Their experience at 25 is so vast that it is hard to understand why they are not in departmental charge at Schenectady or Trafford Park. One such, having been pitchforked into an assistant's job in a railway workshop, was told (after a week or two) to start up the plant next morning. After an hour's delay his chief had to come and do it; for the young genius *could* not and his subordinates *would* not.

For the men selected for interview I have much sympathy; it is a trying business, especially to a man of 30 or more, to have to answer technical conundrums offhand with three or four grey-beards staring at him.

But here are some questions which chartered electrical engineers have failed over :—

(1) What is the full charging voltage of a secondary cell? (Answers from 1.8 to 2.2 from several.)

(2) What will be the approximate fuel consumption of a 500-kW direct-connected Diesel set and the steam consumption of a similar turbine set, per kWh? (Several had no idea at all and had the sense to say so; others, in the same box, guessed —a foolish thing to do).

(3) What methods can be adopted for preventing the high-tension side of a transformer getting into the low-tension circuits? ("Fuses," said one.)

(4) Mention any methods of rendering an overhead line "dead" if it should break? (This stumped most, including a technical college lecturer.)

(5) How is the pressure drop over a rail joint determined?

(6) Distinguish between a motor-generator, motor-converter and rotary converter.

Not much weight, however, need be given to the ability to reply correctly to a *viva voce* examination. What the examiners are after is to see how the candidate behaves; whether he can look you straight in the face and show character and decision there; whether he can say: "I'm sorry, but I can't answer that offhand"; whether he tries to evade plain non-technical questions that are awkward.

One engineer, now very well known at home, obtained his second job and his real start in life by adding three years to his age, on my very immoral suggestion; I expect he is still saddled with those years, and would be glad to get rid of them. On the other hand, the best of a batch I was once interviewing had taken several years off his age, to get within the advertised limit. After some general conversation, when he was off his guard, I said, "Let's see, you are 29, are you not?" He went scarlet, and without more ado admitted the deception. He got the job and left it for a better within six months.

Perhaps the most extraordinary change in the whole matter is the attitude to degrees and diplomas. When I started life a man with a B.Sc. or the like had to keep quiet about it, for fear of being thought a something else also. Now it is an essential qualification for many posts that the applicant shall either have a degree in engineering or science or that he shall have become an A.M.I.E.E. by examination. The war concession in this matter is a little awkward at times.

The Association of Municipal Electrical Engineers (South Africa).

(From Our Special Correspondent.)

THE seventh Convention of the Association of Municipal Electrical Engineers (S.A.) was held in Johannesburg during the week April 12th to 16th, and was largely attended by members and delegates from various parts of the Union.

The first day was devoted to the business meeting, at which the retiring president, Mr. John Roberts, borough electrical engineer of Durban, presented his retiring address.

Mr. B. Sankey, general manager of the Johannesburg gas and electrical undertaking, was elected president for the ensuing year, while Mr. J. Mordy Lambe, city electrical engineer of East London, was elected vice-president, the members of the Council being elected as follows:—Mr. T. C. Wolley Dod, Pretoria; Mr. G. H. Swingler, Cape Town; Mr. John Roberts, Durban, past president; Mr. L. F. Bickell, Port Elizabeth; Mr. T. Millar, Harrismith; and Mr. E. Poole, Durban, with Mr. R. G. Tresise as honorary secretary and treasurer.

It was resolved that the next Convention be held at East London. During the week many interesting visits to works were made, and papers were read by the following :—

"Presidential Address."—Mr. B. Sankey, Johannesburg.

"Alternating Current Sub-Stations and their Equipment for Urban Areas."—Messrs. A. T. Rodwell and P. Fraser, Johannesburg.

(2nd Row).

? — E. POOLE, Durban (Member of Council). T. C. WOLLEY DOD, Pretoria (Member of Council). J. MORDY LAMBE, East London (Vice-President). B. SANKEY, Johannesburg (President). G. H. SWINGLER, Cape Town (Past President). L. F. BICKELL, Port Elizabeth (Member of Council). R. G. TRESISE, Johannesburg (Hon. Sec. & Treas.)

Members and Delegates of the Association of Municipal Electrical Engineers (South Africa) at the Convention held in Johannesburg.

"The Merits of Suction Gas Engines as Prime Movers in Municipal Power Stations."—Mr. H. M. S. Muller, Beaufort West.

"Discussion on Licensing of Electricians." — Introduced by the President.

A joint meeting of the Association and the South African Institution of Electrical Engineers was also held, at which a paper on "Electric Light and Power Schemes for Moderate-sized Towns in South Africa" was read by Mr. R. F. Botting.

The visits included an inspection of the Johannesburg municipal power station, workshops, and distribution system; the steel works of the Union Corporation of South Africa, Ltd.; the works of the Vereeniging Brick & Tile Co.; the Rand Water Board's pumping station; the Rosherville station of the Victoria Falls and Transvaal Power Co., Ltd.; and the Pretoria power station and Royal Mint.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Conserving Our Coal.—In order to conserve our dwindling stocks of coal, an order was made last week by the Mines Department restricting domestic supplies to 1 cwt. a fortnight obtainable only by the written permission of the local authority or its duly authorised officer. Householders were asked to exercise the utmost economy in the use of electricity and gas. In the case of industries, businesses and establishments, the consumption of coal is to be restricted to one half of the normal, unless a special case can be made out to the satisfaction of the local authority. This applies also to the consumption of gas and electricity. The order banned absolutely all lights used solely for display and advertisement, except where they are necessary for the public safety.

Glasgow Corporation and Tramway Strikers.—At a meeting of the Glasgow Corporation on May 27th, Mr. T. A. Kerr, the leader of the Labour group, moved the suspension of the standing orders to enable him to bring forward a resolution instructing the tramway manager to reinstate all employés who ceased work during the general strike. The suspension was refused by a majority, and the Labour members then prevented further proceedings and the meeting was adjourned for a fortnight.

A Useful Demonstration Device.—The *Electrical World* recently made mention of a demonstration device employed by the Alabama Power Co. in one of its show windows. It consists of a board to which are plugged six devices—a bowl fire, a vacuum cleaner, an iron, a percolator, a churn and a small table stove. An electric fan motor operates a contactor device which puts each appliance into circuit in turn for about six seconds. In the centre of the board is an indicating wattmeter calibrated in cents per hour based on the company's rates for energy, and this shows the actual cost of operating each appliance.

The Australian Duty on Radio Valves.—The *Board of Trade Journal* states that the operation of the Australian import duty on valves for radio-telegraphy and telephony has been deferred until July 1st.

Lead.—Messrs. James Forster & Co., reporting on May 29th, stated:—"Prices during the week have been practically stationary. Consumption has again received a check in this country, consumers being restricted to 50 per cent. of their normal fuel supply. This in turn means a smaller demand for lead. In Germany, on the other hand, consumption is improving and a shortage of lead has developed, with the result that orders are being placed in London for prompt shipment. This had the effect of relieving the pressure of supplies here. . . . The future of the market is obscure, so much depending upon whether the coal dispute is settled quickly or not. A restriction of consumption in this country to 50 per cent. of the normal would be bound to be felt if continued for long, but on the other hand, an early settlement would mean a good demand from home consumers for prompt lead and would probably result in a shortage of ex ship lead and a consequent advance in price. The Board of Trade returns for April are:—Imports 30,652 tons, exports 1,946 tons, leaving for home consumption 28,706 tons."

New Indian Companies.—Among the electricity undertakings recently organised in India are the Narayanganj Electricity Supply Co., formed at Armenitola (106 Kaliprasanna Ghose St.) Dacca, Bengal, with a capital of 500,000 rupees, and the Rangpur Electricity Supply Association, organised at Rangpur (Bengal) with a capital of 100,000 rupees.

Dublin Contractors' Meeting.—The *Irish Electrician* reports that the Dublin branch of the Electrical Contractors' Association held its first annual meeting on May 10th, when the chairman, Mr. A. G. Bruty, gave a *résumé* of the work accomplished during the year, including the formation of a joint committee with wholesalers and factors for the discussion of matters of trade interest. Real progress had been made towards a policy advantageous to all interests. Amongst various matters dealt with, the Dublin Commissioners had been seen concerning the proposed drastic restrictions on the erection of electrical signs, and the city engineer concerning fixing tariffs for electric cookers. Membership had increased considerably. Mr. Bruty was appointed chairman, and Mr. A. J. Orr was elected to the committee.

N.S.W. Preference Proposals.—The Premier of New South Wales (Mr. Lang) recently announced that the State Government had decided that in respect of its orders it would grant a preference of 30 per cent. to locally-manufactured articles over foreign goods, and one of 20 per cent. over British goods. The preferences would be inclusive of Commonwealth tariff duties and preferences already in existence. The preference over British goods would diminish according to the amount of duty already imposed upon them. For instance, where a 10 per cent. preference already existed, the State's preference would be reduced to 10 per cent. The Sydney *Daily Guardian* considers that these preferences mean practically nothing to local industries as the principal items required by the Government are already given more than 20 per cent. preference over British goods by the Commonwealth tariff. This journal quotes electrical fittings (35 per cent.) and electrical machinery (40 per cent.) among other examples.

Wages in the Engineering Industry.—The engineering trade unions intend to proceed with their applications for increased wages by districts, the demand for a national increase having been unsuccessful. A conference is to be held at York on June 11th, when it is expected that those districts which have not yet put forward applications will do so. Although it is understood that there was a majority in favour of a strike in the London area, further action has been deferred.

German Turbines for Russia.—An *Exchange Telegraph* message from Berlin states that despite keen English competition, a Russian order for three turbines valued at £40,000 has been secured by the Allgemeine Elektrizitaets Gesellschaft.

Employment During April.—The May *Ministry of Labour Gazette* says that employment in the engineering industry during April, though still bad on the whole, showed a further improvement. In the electrical section it remained fair, although it showed a slight decline as compared with April, 1925. The general engineering percentage of unemployed was 10.4, while in the electrical section the proportion was 6.6 per cent. as compared with 6.7 per cent. in March and 5.6 per cent. in April last year. In both comparisons unemployment in the electrical wiring and contracting industry showed an increase, being 8.6 per cent. On the other hand, unemployment was lower in the electrical cable, wire and electric lamp manufacturing group, at 6.5 per cent.; this figure compared with 8.5 per cent. in April, 1925.

Carrying on During the Strike.—Electrical manufacturing companies took every measure in their power to continue operations during the general strike. The Automatic Telephone Mfg. Co., Ltd., found itself at the outset with a depleted staff of toolmakers, sheet metal workers, cabinet makers and other "key" men, but by a reorganisation a temporary balance was maintained to keep the various departments working and prevent 94 per cent. of the staff from being thrown out of work. Two of the company's delivery vans were put into service as temporary "'buses" to enable the staff to get to and from their homes.

"Exide" Batteries at the Pole.—Another example of the reliability of "Exide" batteries under strenuous conditions is demonstrated by the fact that the airship *Norge* was equipped with these batteries for radio and other purposes during her eventful trip over the North Pole. The Byrd and Wilkins expeditions also used "Exide" batteries.

Chilean Commercial Secretary's Address.—As from June 5th the address of Mr. W. F. Vaughan Scott, the Commercial Secretary for Chile, will be 66, Calle Teatinos, Santiago.

The National Radio Exhibition.—We have received from the National Association of Radio Manufacturers and Traders full details of the arrangements for the National Radio Exhibition which is to be held in the New Hall, Olympia, from September 4th to 18th next. The Association states that although the space contract will be with itself (as being the only body properly constituted to enter such a contract) the promoters are the Radio Manufacturers of Great Britain—members of the N.A.R.M.A.T. and of the Society of Radio Manufacturers. The allocation of space will be made by ballot in the case of firms whose applications are received by June 14th; thereafter the allotment will be at the discretion of the organisers. The regulations for the Exhibition contain a number of matters of interest. In the first place, there is nothing in them to indicate that the Exhibition is confined to members of the two associations mentioned; it can be assumed, therefore, that any maker or distributor of radio apparatus can enter, subject to the proviso that all exhibits and component parts thereof must be of British manufacture, *i.e.*, made in Great Britain or Northern Ireland. No "listening" or loud speaker demonstrations by exhibitors will be permitted, nor any electric signs or other apparatus capable of causing interference. No exhibitor may give, or assist or support the giving of, any public demonstration within a quarter of a mile of the Exhibition. Publicity matter issued from the stands is to be subject to the Exhibition Committee's approval and must only deal with actual exhibits. Each exhibitor is required to provide a fire extinguisher for his stand. The organisers have made arrangements with the British Broadcasting Co., Ltd., for the reproduction of its programmes, and the Royal Air Force band has been engaged for the run of the Exhibition.

A Handicap to Australian Electrical Development.—Giving evidence recently before the South Australian Royal Commission on Manufactures and Secondary Industries, Sir John Monash, chairman of the Victorian Electricity Commission, said that Victoria was poorly industrialised, in spite of cheap power, on account of the high tariffs on imported articles. He maintained that the heavy duties on electricity consuming devices, such as radiators, fans, stoves, &c., should be removed. In that matter the interests of the community at large were in direct conflict with those of the manufacturers.

Sales Conference.—Representatives of Philips Lamps, Ltd., from all over the country recently came together in conference to discuss the policy for the coming lighting season. On the second and concluding day of the conference a dance was held at the Wellington Hall, St. John's Wood, and the event proved very successful.

New Canadian Works.—New works for the manufacture of secondary batteries for motor car, radio and marine use, have lately been completed in Kingston, Ont., by the Monarch Battery Co., Ltd.

The Timber Market.—Our timber trade correspondent reports that the heavy stocks of building and general utility woods in the country, so noticeable at the end of the first quarter of the year, were supplemented by increased quantities imported in April. The consumption throughout the first four months of the year, however, was good, which kept the stock position at a fair volume. The general stoppage of trade during the early days of May was the means of restricting large supplies going into consumption, but this condition should be levelled off by the expected greater demand in the early future, and particularly when the coal dispute is ended. The hardwood trade on the whole cannot be described as strong. Imports of mahogany have increased, especially of the lower grades, which require much effort to sell from first hands, although good qualities keep firm in value. Sawn hardwoods from the United States, principally oak, arrived more freely last month compared with a year ago; these were not wanted, considering the large stocks already held before their arrival. In hard and fancy woods generally the demand is usually limited, but the call at present is very much restricted. The poor grades, both as regards quality and size, are hard to sell from first hands, but good logs command full figures.

Trade Announcements.—MESSRS. MANDA MOTORS, LTD., of Royal Mint Street, E.C., who commenced manufacturing operations in March last year, are taking additional factory accommodation. They have been placed on the Admiralty list.

The head offices of the SCOTT INSULATED WIRE CO., LTD., have now been removed to their new premises at 44, Queensland Road, Holloway, N.7. Their new telephone number is North 1707 (not 1706, as given in our issue of May 7th).

MESSRS. PRITCHETT & GOLD and E.P.S. CO., LTD., state that they are despatching as quickly as possible all orders which were held up by the strike consequent upon the difficulty experienced in moving goods either from the works at Dagenham Dock or from the Pimlico Road depôt.

MESSRS. MEDWAY'S SAFETY LIFT CO., LTD., have appointed Messrs. Fairclough & Co., Ltd., 11, New Station Street, Leeds (Telephone No. "Leeds 21105"), as their agents for the Leeds district.

The PHŒNIX ELECTRICAL CO., LTD., has removed to 18, Scotland Street, Glasgow. 'Phone No.: "South 2011."

MESSRS. JAMES GORDON & CO., LTD., report a record month in the sale of Cope's feed-water regulators, 50 sets having been ordered during May for super power stations.

Mr. E. A. PINTO has transferred his Margate and Hythe businesses to his head office at 96, High Street, Ramsgate, to which address all communications should be sent.

Catalogues and Lists.—MESSRS. D. H. BONNELLA & SON, LTD., 46 and 48, Osnaburgh Street, N.W.1.—A well-illustrated, priced catalogue of automobile accessories, including lighting fittings, fans, cigar lighters, flower vases, &c.

WESTINGHOUSE ELECTRIC & MANUFACTURING CO., East Pittsburgh, Pa., U.S.A.—A booklet dealing with the design of electric motors, written for users.

MESSRS. FERGUSON, PAILIN, LTD., Higher Openshaw, Manchester.—Catalogue Section No. 30 B1, illustrating and describing oil-immersed circuit breakers for outdoor service at pressures ranging from 11,000 V to 135,000 V and of various rupturing capacities.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38 and 39, Upper Thames Street, E.C.4.—A priced and illustrated list (No. 151) of "Siemens" electric fans of various patterns.

MESSRS. NEWTON BROS. (DERBY), LTD., Alfreton Road, Derby.—A catalogue containing illustrations and full particulars of the company's induction motors ranging in capacity from 3 to 240 h.p.

MESSRS. W. WADSWORTH & SONS, LTD., Bolton.—A well-produced brochure, illustrated with half-tone and coloured reproductions, describing the firm's electric lifts in very full detail.

THE BENJAMIN ELECTRIC, LTD., Brantwood Works, Tariff Road, Tottenham, N.17.—"The Benjamin Reflector" for May-June, containing illumination data and particulars of "R-L-M" reflectors.

MESSRS. L. G. HAWKINS & CO., LTD., 30-35, Drury Lane, W.C.2.—A priced and illustrated sheet advertising the "Supreme" fan and "Universal" toasters, table cookers, &c. Also folders dealing with an electric floor polisher, which can be hired, and the "Universal" electric curling iron.

"Z" ELECTRIC LAMP & SUPPLIES CO., LTD., 73, Newman Street, W.1.—A price list of "Cosmos" electric fans.

THE S.G. BRILL COMPANY, Aldwych House, Aldwych, W.C.2.—A wall-chart bearing illustrations of "Brill" tramcar parts and a pad of order slips.

THE SUN ELECTRICAL CO., LTD., 118 and 120, Charing Cross Road, W.C.2.—A series of illustrated pamphlets dealing with the "Sunshine" vacuum cleaner, lightning arresters for radio sets, electric floor polishers, electric sterilisers, violet-ray apparatus, &c.

STANDARD TELEPHONES & CABLES, LTD., Bush House, Aldwych, W.C.2.—A handsome brochure containing an illustrated description of the installation of the company's "Public Address" system in the new Liverpool Cathedral.

MESSRS. NEGRETTI & ZAMBRA, LTD., 38, Holborn Viaduct, E.C.1.—List No. T6, containing particulars of the company's electrical thermometers and pyrometers.

THE IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, E.C.4.—Publications Nos. 6216 and 6219, dealing, respectively, with a "Universal" coil holder, and a tone control and damping resistance. Illustrated and priced.

MR. J. R. MORRIS, 15-19, Kingsway, W.C.2.—A priced and illustrated pamphlet advertising "Columbia" dry batteries for radio work.

SIEMENS BROS & CO., LTD., Woolwich, S.E.18.—Price Sheet 641, containing full details of the company's dry batteries for all purposes.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, W.C.2.—A showcard advertising the company's automobile lamps and Leaflet No. 74, dealing with Philips rectifiers for automobile and radio batteries.

Bankruptcy Proceedings.—STEPHEN PAGE, Carholme Road; FRANK LEECH, Breadgate, both Lincoln; and HENRY HUDSON, Shrewsbury Road, Sneinton, Notts., trading in co-partnership as the East Midland Engineering Co., Lincoln, engineers. The following are creditors herein:—

	£		£
Edison Swan Electric Co., Ltd.	186	Clegg, Stanley	101
Dawson's Electric Co.	91	Crampton & Co., Ltd.	34
Howard, G. A.	45	Tucker, J. H., & Co., Ltd. ...	22
Chloride Electrical Storage Co., Ltd.	52	Lincoln Corporation	22
Shipley & Co., Ltd.	27	Bright, J. & A., J. B. Anderson, Mellers, Basden & Mellers, Darbyshire & Co.	80
Fyfe, Douglas	42		
Croft, Alice	55		

W. H. GREENALL, trading as the Hampton Electric Co., Newerne Street, Lydney, Glos., electrician.—The first meeting of creditors was held on May 26th at Cardiff. The statement of affairs showed liabilities of £472 and assets of £65, leaving a deficiency of £407. Debtor attributed his failure to losses on contracts. The case being a summary one, was left in the hands of the Official Receiver as trustee.

F. J. NORTH, electrical engineer, 13a, Midland Road, Wellingborough.—Trustee, Mr. D. Helliar, The Parade, Nottingham, released May 18th.

S. J. WATSON, lately carrying on business with H. Rothwell and F. C. Jinks as the Vulco Magneto Co., 11, Long Acre, W.C.—Last day for proofs for dividend, June 12th. Trustee, Mr. D. Williams, Official Receiver, Carey Street, W.C.

J. WORSLEY, electrician, 10, Green Street, Darwen.—First and final dividend of 5s. 7d. in the £, payable June 11th, at the Official Receiver's offices, 11, Winckley Square, Preston.

Company Liquidations.—C. A. C. RADIO, LTD., 10, Rangoon Street, E.C.3, and at Bournemouth and Leeds.—A meeting of creditors was held on May 21st at Winchester House, E.C., when the chair was occupied by Mr. E. W. Sudlow, C.A., Ilford, Essex, who stated that he had been appointed to act as the liquidator in the voluntary liquidation of the company. No statement of affairs was presented, but it was reported that the liabilities amounted to £14,600, and that there was a deficiency of £6,148. The issued share capital of the company was £19,500, so that the total deficiency was £25,648. The liquidator stated that at two previous meetings of the creditors it was thought that a scheme might be put forward whereby the company would be able to carry on. That scheme, however, did not materialise and eventually resolutions were passed for voluntary liquidation. The liquidator added that since he had been appointed he had found very serious discrepancies between the figures given at the first meeting and those which were now before the creditors and that had full information been given at the time there would have been no possibility of any scheme being formulated. A resolution was passed to the effect that application should be made to the Court for the appointment of Mr. J. W. Galloway to act as joint liquidator with Mr. Sudlow.

SHENTON & CO., LTD., wireless and electrical engineers, 68, Shoe Lane, E.C.—A meeting of creditors was held on May 26th at the offices of Messrs Poppleton, Appleby & Hawkins, Charterhouse Square, E.C., when the chair was taken by Mr. E. H. Hawkins, who had been appointed to act as joint liquidator with Mr. W. B. Pearson, John Street, W.C. The statement of affairs submitted disclosed liabilities of £4,700, and the assets, after allowing £3,600 for debentures, totalled £2,550, leaving a deficiency of £2,150. Mr. Hawkins reported that the company was registered in January, 1922, as a private company with a nominal capital of £4,000, of which 3,000 shares were issued as fully paid to a Col. Handley as purchase price for a business which Col. Handley had bought from the receiver of the company then known as F. J. Shenton & Co., Ltd. Various accounts had been prepared showing a series of net losses. The liquidator said that from time to time the company borrowed money from its bankers on the guarantee of Col. Handley and from the Electrical Trades Supply Co. The company was pressed for repayment of the loans and made strenuous efforts to obtain further capital from another source, and after considerable negotiations a Mr. E. H. Tubbs found £3,500, of which £1,000 was paid to the bank, and £1,500 was utilised to satisfy the claim of the Electrical Trades Supply Co., leaving £1,000, which was used as working capital. To secure the loan the company created debentures up to £4,000 at 7½ per cent. interest, of which £3,500 worth were issued to Mr. Tubbs. Col. Handley then resigned from the board and transferred his shares to Mr. Tubbs and a Mr. W. Nicholson was also appointed a director. At a later date Mr. Tubbs resigned his position as a director and on February 25th last, in order to protect the assets against seizure by the sheriff, he appointed Mr. Pearson as receiver. Mr. Pearson cut down the working expenses of the business to a considerable extent and had paid £1,100 off the debentures. The meeting broke up without any resolution being passed, but an advisory committee was appointed, consisting of Mr. Adams, representing the

Siemens & English Electric Lamp Co., Ltd., Mr. W. A. J. Osborne, representing creditors, and Mr. E. Judd, of Corfield's Traders' Association, representing the "Z" Electric Lamp and Supplies Co. The following are creditors:—

BURWOOD (CONCESSIONAIRES), LTD., wireless and electrical manufacturers, Great Queen Street, W.C.—A meeting of creditors was held on May 26th, at the offices of the Society of Incorporated Accountants and Auditors, E.C., when a statement of affairs was presented, showing liabilities of £1,679, all due to unsecured creditors. There were debentures and interest amounting to £517. The net assets were £213, leaving a deficiency as regarded the creditors of £1,466, and a total deficiency of £2,466. The liquidator reported that the company was registered in July 1925, with a nominal capital of £1,000 in £1 shares, and took over the business originally carried on under the style of the Burwood Electric Supply Co. The total purchase price was £1,308. On January 22nd last a debenture was registered for £500, to Mr. J. H. Wood, for a cash consideration. Branches were opened at Manchester, Dublin and Brighton. None of those branch shops had done an extensive business, and apparently losses were incurred throughout. The present position was attributed mainly to a trade protection agency putting the company on its "black list." In reply to questions, the liquidator said that if there were any books he had not been able to obtain them. He was unable to state who the vendor was or who were the partners of the Burwood Electric Supply Co. Mr. J. H. Wood (the managing director) knew nothing about the business of the company; he supplied the money and left the business entirely to his brother, Mr. L. R. Wood. The liquidator also said that he was appointed as liquidator on April 10th, and on May 10th he was appointed receiver for the debenture holders. He stated that the greater part of the stock was made up of wireless parts. The creditors decided not to confirm the voluntary liquidation. The following are creditors:—

	£
Bergmann Electric Co., Ltd.	623
Brownie Wireless Co., Ltd.	25
Cleartron Radio, Ltd.	60
Ferranti, Ltd.	20
General Electric Co., Ltd.	20
International Wireless Manufacturers	75
Metro-Vick Supplies, Ltd.	40
Maltzhm & Sprager	40
Pratt, F.	40
Raper, C.	28
Rothermel Radio Corporation of Gt. Britain, Ltd.	75
Re-Echo Radio Co., Ltd.	40
Rochester Automobile Co., Ltd.	86

SCAMMELL & ABBOTT, LTD., Birmingham, electricians, and dealers in radio goods.—A further meeting of creditors was held recently. At the previous meeting a statement of affairs was submitted which disclosed liabilities of £1,572, all due to unsecured creditors, while the net assets amounted to £276, leaving a deficiency of £1,296. Messrs. Scammell and Abbott were both present at the adjourned meeting, and stated that according to a balance sheet which was prepared up to the end of May, 1925, the company was then solvent. At that time there were certain moneys due to them in respect of undrawn salaries. The business was disposed of a few weeks previously by the receiver for £400. It appeared that for the past year the trading of the company had resulted in heavy losses. It was decided to confirm the voluntary liquidation of the company, with Mr. W. F. Chaundy, Birmingham, as liquidator. A committee of inspection was also nominated, consisting of Messrs. A. Cripwell, Wood, and F. E. Bendall.

FULLER'S UNITED ELECTRIC WORKS, LTD.—Mr. Justice Romer, in the Companies Winding-up Court, on June 1st, again had before him a petition for the compulsory liquidation of this company. Mr. Hunt, Counsel for the judgment creditor (Mr. R. H. Symonds), said the petition was stood over for a scheme of arrangement, but his client had received no communication from the company since, and so far as he could say, no scheme of arrangement was forthcoming. He, therefore, asked his Lordship to make the usual order for compulsory winding-up. His Lordship made this order.

RADIO PHONOPHORE & ELECTRIC, LTD.—Mr. Justice Romer, in the Winding-up Court on Tuesday, adjourned the petition of Mr. C. W. Slingo, of Ealing, for an order for the compulsory liquidation of this company. Counsel for petitioner said he understood that negotiations were proceeding, which it was hoped would lead to the purchase of the company's business, and to the payment of all the creditors.

ACE BATTERY CO., LTD.—Winding up voluntarily. Liquidator, Mr. H. Sands, Imperial Buildings, Victoria Street, Nottingham.

MAYWOOD ENGINEERING AND ELECTRICAL MANUFACTURING CO., LTD.—Winding up voluntarily. Liquidator, Major L. Russell-Wood, 27, Charles Street, Holland Park, W.11.

DOUGLAS SOUTHERN ELECTRIC TRAMWAYS, LTD.—A meeting of creditors was held on June 3rd, at the offices of the Liquidator, Mr. L. N. Jackson, 71, King Street, Manchester. Particulars of claims to the Liquidator by July 5th.

BRISTOL & SOUTH WALES ELECTRIC WELDING CO., LTD.—Particulars of claims to the Liquidator, Mr. P. Jones, Premier Buildings, 6 and 7, St. John Square, Cardiff, by June 14th.

GENERAL ELECTRIC TRAMWAYS CO., LTD.—Winding up voluntarily. Liquidators, Messrs. T. Gower and H. W. Davis, 88, Kingsway, W.C. A meeting of creditors was held on May 31st. Particulars of claims to the Liquidators by June 30th.

Private Arrangements.—J. V. BRITTAIN, electrical and wireless engineer, 121a, Liverpool Road, Stoke-upon-Trent.—The creditors interested herein were called together recently, when a statement of affairs was submitted which disclosed liabilities of £6,112 and net assets of £2,931, leaving a deficiency of £3,181. It was reported that debtor started business in November, 1923, without capital. Some time ago he opened a cycle factoring business in Liverpool Road and traded as the Stirling Engineering Co. In reply to questions, it was stated that the turnover in 1924 was approximately £12,000 and in 1925 £20,000. Very little gross profit had been made. It was decided to accept a composition of 7s. 6d. in the £ payable as to 3s. 4d. in three months, 3s. 4d. in six months, and the balance in nine months, secured by the execution of a deed of assignment in favour of Mr. G. G. Poppleton, Birmingham, as trustee, with a committee of inspection. The following are the principal creditors:—

	£
Siemens & English Electric Lamp Co., Ltd.	750
Metro-Vick Supplies, Ltd.	200
Marconiphone Co., Ltd.	180
Burndept Wireless, Ltd.	85
Graham, Alfred, & Co.	172
Pope's Electric Lamp Co., Ltd.	313
Edison Swan Electric Co., Ltd.	440
General Electric Co., Ltd.	200
Falk, Stadelmann & Co., Ltd.	270

The Erste Brunner Machinery Works.—A Vienna correspondent of the German *Vossische Zeitung* draws attention in the issue of that journal for May 18th to the position of the Erste Brunner Maschinenfabriks Gesellschaft, which was rightly regarded as one of the greatest industrial undertakings in former Austria-Hungary, and in Czecho-Slovakia after the collapse of the dual monarchy. The company had always paid high dividends and transferred considerable sums to reserve funds. Under the influence of the large banks in Vienna it was able to obtain a big dollar loan in the United States last year, the undertaking tending financially more towards Vienna than to Prague and the interests of the Stock Exchange being greater in Vienna than in Prague, as numerous Austrian shareholders had retained their shareholdings despite the fact that the concern had passed into Czecho-Slovakia. Suddenly a fall in the quotations for the shares of the Brunner undertaking took place and this continued after the markets in other directions had begun to show signs of recovery. The directors announced after a meeting held in February that the dividend for 1925 could be estimated at 25 Czech crowns, with corresponding allocations to the reserve fund, this result comparing with 35 Czech crowns in the previous year. This diminution in the results by no means justified the constant fall in the shares; wild reports got into circulation without, however, the directors finding it necessary to take up a position in regard to them. This incomprehensible situation continued for two months until it was learned that Dr. Franz Pauker, general director of the Brunner Works, had resigned. The directors have now communicated the results of a further meeting, their statements confirming the worst apprehensions. There is no question of any profits for 1925; the secret reserves and probably a large part of the open reserves (56,000,000 Czech crowns) will have to be drawn upon for the extinction of the losses which have been suddenly ascertained. The directors' communication is silent on what has really happened, but the correspondent states that it appears to have been established that false balance sheets have been prepared perhaps for years, in which the stocks, debtors, doubtful claims and even the claims in foreign currency, have been entered at a level far in excess of their real value. The correspondent adds that the losses incurred by the shareholders are immense and that it is incomprehensible how these conditions could have escaped the patronising banks or the investigation which was carried out on behalf of the New York banking firm before the loan of 4,000,000 dollars was granted.

The Pulverised Fuel Plant for Barking.—The contract for the installation of pulverised fuel-firing at the new extension of the County of London Company's power station at Barking will take nearly three years to complete at a cost of more than £750,000. The Lopulco system is to be installed (International Combustion, Ltd.), and we are informed that the contract includes ten B. & W. boilers of 16,500 square feet heating surface, ten Usco air heaters of 18 600 sq. ft. heating surface, ten "Lopulco" furnaces that will absorb 65,000 sq. ft. of Murray fin tubing, ten 15-ton super Raymond pulverising mills, ten exhausters ten cyclones, ten economisers, each with 6,100 sq. ft. heating surface, ten super-heaters, each with a heating surface of 6,500 sq. ft., 20 induced and ten forced draft fans. Each combustion chamber will have a volume of 10,800 cubic feet, based on a combustion of 24,000 B.th.u.'s per cubic foot maximum, and approximately 16,800 B.th.u.'s per cubic foot normal rating. Each combustion chamber will be fitted with 11 burners with Usco suspended arches. In addition, there will be five chimneys complete with two grit catchers, boiler feed pumps, Bailey instruments, boiler house plant buildings, turbine house buildings and switchgear house buildings.

Unemployment.—On May 17th the number of persons registered as unemployed was 1,612,700. This total was 36,801 more than on May 10th and 427,680 more than on the equivalent date of 1925. In addition to the total given above claims for benefit had been lodged by 408,000 persons affected by the coal dispute and the general strike.

Book Notices.—"Touring by Motor Coach" (114 pp. and map). Atherton (Lancs.): The Lancashire United Tramways, Ltd. Price 6d.—This handbook contains full particulars of the company's motor services which cover a very wide area. It is also an illustrated guide book to the places served by the coaches.

The McGraw-Hill Publishing Co., Ltd., 6, Bouverie Street, E.C.4, has issued its May list of books on mechanical engineering and allied subjects. A brief indication of the scope of each work is given.

Handbooks of the U.S.A. Bureau of Standards: No. 6, "Safety Rules for the Installation and Maintenance of Electrical Supply Stations" (10 cents); No. 7, "Safety Rules for the Installation and Maintenance of Electric Utilisation Equipment" (15 cents).

"Southampton Docks." (Pp. xlix + 135, ill.) London: Southern Railway Co.—This profusely-illustrated brochure contains full particulars of the facilities available at the Southampton Docks, with details of handling charges, &c., as well as a great deal of general information of service to shipowners and traders.

"Power-Factor Wastes," by C. R. Underhill. First edition. Pp. xiii + 326; figs. 117. London: McGraw-Hill Publishing Co., Ltd. Price, 17s. 6d.

"*Journal* of the Institution of Electrical Engineers." Vol. LXIV. May, 1926. London: E. & F. N. Spon, Ltd. Price, 10s. 6d.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLV. No. 5. May, 1926. New York: The Institute. Price $1.

Dutch Electrical Exports.—The American Vice-Consul at Rotterdam informs *Commerce Reports* that exports of electrical machinery and equipment from the Netherlands during 1925 increased in volume by 208 metric tons, but fell in value by 1,515,000 florins. The total value was 31,135,000 florins and the weight 12,914 metric tons. There was an increase in practically all classes, the only exceptions being lamps, generators, and small motors. The lamp exports accounted for 21,966,000 florins of the total, as compared with 25,076,000 florins in 1924. The exports of radio apparatus (largely to Great Britain) were doubled in value, and there were appreciable increases in shipments of telegraph and telephone apparatus and cables.

Social Events.—On May 19th about 95 of the employés of the Woking Electric Supply Co. travelled by road to Eastbourne for their annual outing. Upon arrival lunch was served at the Gildridge Hotel, and in the course of the proceedings reference was made to the loyalty of the staff during the general strike. The party returned *via* Horsham and on the way organised a tug-of-war competition in which the Wiring Department proved successful.

To celebrate the opening of the Rotherham Corporation's first power station 25 years ago, the staff held a dinner on May 20th. Alderman A. R. Habershon (chairman of the Electricity Committee) presided, and Mr. E. Cross (chief engineer) and Mr. H. N. Rodgers (superintendent) who were with the original undertaking, were present. Proposing the toast of "The Department," Mr. Rodgers said that during the last two or three years the station had produced electricity at the lowest cost in the country. The total plant capacity had risen from 240 kW 25 years ago to 70,000 kW to-day. Mr. E. Cross, in reply, said that when they started the power station in Rotherham there was a staff of eight, and now there were 308. During the current year they had connected 800 consumers; it had taken from 1901 to 1915 to connect an equal number. Referring to the cost of production, Mr. Cross said that last year they were something like 15 per cent. better than the next best. This year they looked like being 20 per cent. better; the figure for 1926, he thought, would be the wonder of the country, it would probably be from .45d. to .38d. per kWh. Mr. Cross criticised the Electricity Bill, and said that in Rotherham they could generate electricity much cheaper, if left alone, than they would be able to do if the proposals of the Government, as they stood at present, were adopted. Alderman Habershon also replied, and said that it was most important for them to see that their consumers got their electricity at the cheapest possible cost instead of aiding the rates. An excellent musical programme was provided.

The Brush Electrical Engineering Co.'s football club wound up a successful season recently with a dinner at the Boot Hotel, Loughborough. The members of the team were congratulated on winning the championship cup and medals and on being the runners-up in the County Medal competition. Mr. W. J. Hume, who presided, was presented with a replica of the cup in appreciation of his services.

The Laundry Exhibition.—The International Laundry and Allied Trades' Exhibition was held at the Agricultural Hall, N., last week. A great deal of laundry machinery was on view and much of it was electrically-driven; it was noticed, however, that the belt drive was favoured rather than the use of direct-coupled motors. Among the firms showing machinery employing the latter mode of driving were Messrs. Thos. Broadbent & Sons, Ltd., who had upon their stand several examples of hydro-extractors with the centrifuge mounted upon the motor shaft—either above or below the motor. The largest machine shown had a 48-in. diameter container. Messrs. Watson, Laidlaw & Co., Ltd., also showed motor-driven extractors incorporating a safety cover which could only be raised when the motor was at rest. Messrs. Thos. Bradford & Co. exhibited a large drying and finishing machine chain driven by a 7.5-h.p. motor, hot air being supplied by a "Thermofan." The control gear was of "Brookhirst" manufacture. The principal exhibit of Messrs. W. H. Allen, Sons & Co., Ltd., was a steam engine coupled to a 100-kW, 220-V, d.c. generator. The company also showed a 15-b.h.p. crude-oil engine; motor-driven centrifugal pumps; a 35-b.h.p. vertical-spindle motor; and a motor-driven turbine borehole pump. The Hurley Machine Co. displayed its washing, wringing and ironing machines. Two of the last were electrically heated—by no means a common practice here. The smaller ironer has a total loading (*i.e.*, motor and heater) of 1,100 W; there are controls at each end—for either hand, and swinging racks for the ironed articles. The length of the roller is 44 in. and it is eminently suitable for domestic use. The larger machine, designed for small laundries, such as those at institutions, has a 50-in. roller and is equipped with the same easy control devices as the smaller ironer. The Singer Sewing Machine Co. showed a number of electrically-driven and illuminated sewing machines. Messrs. Matthews & Yates, Ltd., exhibited a number of "Cyclone" motor-driven fans and an air washer. Boiler furnaces were displayed by the Turbine Furnace Co., Ltd., and Messrs. Crosthwaite (Leeds), while boilers, boiler fronts, and steam engines were shown by Messrs. Davey Paxman & Co., Ltd.

For Sale.—Mr. A. G. Ralston, of Philipstoun, West Lothian, owing to the change-over to the public supply, has for disposal two 32-kW Westinghouse transformers, two 25-kW rotary converters, and several lengths of armoured cable. Grimsby Corporation Electricity Department invites offers for one 210-kW Belliss & Morcom-Westinghouse steam generating set. Aberdeen Corporation Electricity Department invites offers for one 720-kW d.c. generating set, surface condenser, pumps, &c. Aberystwyth Corporation electricity works has for disposal several generating sets, Paxman boiler, two Worthington pumps, heater, water cooler, pipes, &c. Mr. H. J. Shaw will sell by auction on June 9th, at 13, High Holborn, W.C., wireless and electrical goods and material. (See our advertisement pages to-day.)

A Greek Contract.—*The Times* reports that in face of competition from American, German, French, Swedish, and Italian concerns, the new Antwerp Telephone and Electrical Works has secured sole rights for the reorganisation and exploitation of the Greek telephone and wireless services. The contract is worth about two and a half millions sterling.

Lighting and Power Notes.

Argentina.—HYDRO-ELECTRIC DEVELOPMENT.—Work has recently been completed by the Sociedad Empresa de Luz y Fuerza, of Mendoza, on the construction of a hydro-electric station at Cachenta. The new plant will enable the company to dispense with its small steam-operated generating sets which have been very costly to run owing to the high cost of fuel. The company is now supplying electricity to 11,553 consumers, representing a load of 21,418 kW.

Australia.—VICTORIA.—The Electric Supply Co., Ltd., has prepared a scheme in connection with the acquisition of its undertakings in Bendigo and Ballarat by the local authorities. It proposes that the concession shall be extended for a minimum of 30 years. The local authorities would then be paid a percentage of the profits, according to a sliding scale, and a sinking fund would be formed to permit of the authorities taking over the undertakings free of charge at the termination of the concession.

Arrangements are being made by the Victorian Electricity Commission for dealing with the requirements of further energy by the metropolitan and outer metropolitan districts. The output of energy from the Yallourn and Newport "B" generating plants combined has now reached a total of 627,000 kWh daily, and over 15,000,000 kWh was received at the Yarraville terminal station in March. This quantity exceeded that for the corresponding period of 1925 by more than 50 per cent., and it is anticipated that the following year will exceed the current year for the same period by at least 50 per cent. Works are being carried out to accomplish a change by which energy will be transmitted from the Commission's system to the major portion of the area served by the Melbourne Electric Supply Co. Additional electrical circuits are being arranged between the Yarraville terminal station and the South Melbourne sub-station of the Commission, crossing the River Yarra by two steel towers, each 250 ft. high. A number of additional h.p. sub-stations with connecting mains will complete these works.—*Reuter's Trade Service* (Melbourne).

Beckenham.—ELECTRICITY CHARGES.—The Urban District Council has decided to wire the houses on the Shortlands Estate, and electricity is to be supplied at the fixed weekly rate of 1s. 3d. for two-bedroom houses and 1s. 6d. for three-bedroom houses, all electricity consumed being charged at 2d. per kWh, or if a cooker is installed at 1½d. per kWh.

Bridport.—ELECTRICITY SCHEME.—The Town Council has decided to make application for a loan of £25,000 to carry out an electricity scheme for the town. The power station is to be erected at West Allington and the charges are to be 1¼d. per kWh for power and 8d. per kWh for domestic purposes.

Burnley.—MAINS EXTENSIONS.—The Electricity Committee has recommended to the Corporation that mains extensions be proceeded with in the Lowerhouse and Cheapside districts at an estimated cost of £5,000.

Canada. — HYDRO-ELECTRIC DEVELOPMENT. — There is a possible development of 600,000 h.p. on the Gatineau River properties controlled by the International Paper Company, according to Mr. A. H. White, of New York, chief engineer of the company, speaking before the Ottawa branch of the Engineering Institute of Canada. The total cost of the storage dam above Maniwaki, the electrical development, and the paper mill, will be in the neighbourhood of $50,000,000. Mr. White confirmed the purchase of Paugan Falls from the Hull Electric Company, and stated that plans and surveys had been made for its development, but that work had not commenced. The power development at Paugan Falls, Chelsea, and Farmer's Rapids, will deliver 405,000 h.p. Of this amount 220,000 h.p. had been contracted for by the Ontario Hydro-Electric Power Commission and the paper mill would require 36,000 h.p.

Chislehurst.—CHANGE-OVER.—The Urban District Council has given its consent to an application from the Foots Cray Electricity Supply Co., Ltd., to change the pressure of supply in its area from 100 to 200 V.

Continental.—BELGIUM.—The report of the Société Intercommunale Belge d'Electricité shows that the capacity of the plant at its eight power stations increased from 124,250 kW to 150,250 kW. The sales of electricity during 1925 were 36 per cent. in excess of those of the preceding year. In order to provide against any interruption in the supply, the central stations at Sweveghem, Alost, and Malines are being linked together by a 50,000-V transmission line. In order to meet the increasing demand the Société Bruxelloise d'Electricité, of Brussels, is increasing its capital from 15 to 22 million francs with the object of adding a new 30,000-kW turbo-generator at its power station, the output of which last year increased by 30 per cent.

The Société d'Electricité de la Campine, which was formed some time ago, has so far confined its attention to the distribution in a number of communes in the province of Limburg of electric power obtained from collieries in the Limburg and Antwerp provinces. It has now decided to establish its own power station of from 15,000 to 20,000-kW capacity at a convenient point in the new Campine coalfield.

SWEDEN.—Considerable changes have recently been effected at the hydro-electric station at Trollhattan, Sweden, bringing the capacity of the plant up to 120,000 kW. Two of the 10,000-kW sets have been converted from 25 to 50 cycles, while two of the turbines have been provided with double generators, one for either frequency. A 132-kV transmission line has also been established between the Trollhattan plant and the State steam-operated power station at Västeras.

GREECE.—It is reported that a syndicate has been formed in Athens to establish a large hydro-electric station to utilise the power of the Vladova Falls about 75 miles west of Salonica.

ITALY.—The Società Generale Elettrica de l'Adamello is doubling the capacity of its power plant at Adamello, which when completed will be able to supply 300 million kWh per annum.

Ealing.—LOAN SANCTIONED.—The Town Council has received sanction to the borrowing of £52,547 for mains and services, and £67,453 for works on consumers' premises, in connection with the change-over of its system of electricity supply.

Fleetwood.—NEW PLANT.—The Urban District Council is to install a 2,000-kW set, a new boiler and auxiliary plant at its electricity works at a cost of £21,000, and application is being made for sanction to a loan for this purpose.

Glasgow.—PROGRESS DURING APRIL.—During April 110 houses were wired under the Corporation's assisted wiring scheme, bringing the total to date to 2,232. The number of applications for the hire of appliances was 110, bringing the total to date to 10,291.

Guildford.—ELECTRICITY IN BULK.—The Electricity Committee has under consideration the question of providing bulk supplies from the new generating station to neighbouring authorities. The Cranleigh Gas & Electricity Co. is applying for an Electricity Order for the Cranleigh area based upon a bulk supply from the Corporation.

Hornsey.—LOAN SANCTIONED.—The Electricity Committee has received sanction to the borrowing of £26,000 for mains and services

Leeds.—ELECTRICITY IN BULK.—The Electricity Committee has received consent to an extension of the agreement for the supply of electricity in bulk to the Morley Corporation.

London.—ISLINGTON.—The Electricity Committee has decided to install four additional h.p. feeders at an estimated cost of £25,000.

Mansfield.—NEW SUB-STATION.—The Electricity Committee has recommended to the Town Council the erection of a 100-kW sub-station in connection with the supply of electricity to Mansfield Woodhouse, and that application be made for sanction to a loan of £2,500 for that purpose.

Melton Mowbray.—STREET LIGHTING.—The Urban District Council has accepted the tender of the Melton Mowbray Electric Light Co., Ltd., for public lighting for a term of five years at £225 per annum and 4½d. per kWh for electricity consumed, the company to maintain and renew all standards, &c.

Price Reductions.—Reductions in the charges for electricity have been made in the following districts:—

GILLINGHAM.—Heating, cooking and domestic purposes: 1½d. per kWh for the first 100 kWh per quarter and 1d. per kWh beyond.

GUILDFORD.—Lighting: First 500 kWh per quarter from 7½d. to 6¾d. per kWh; all energy in excess of this amount from 4½d. to 3¾d. per kWh. Power and heating: First 500 kWh per quarter, from 2¾d. to 2½d. per kWh; beyond, from 2d. to 1¾d. per kWh. Kinemas and theatres: First 100 kWh per week, from 4½d. to 3¾d. per kWh, above this amount, from 2¼d. to 2d. per kWh. Industrial supplies: Combined rate for lighting and power, from 2d. to 1¾d. per kWh.

Preston.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £10,000 for the purchase of domestic apparatus to be let out on hire.

Queensbury.—ELECTRICITY SUPPLY.—The Urban District Council has decided to link up with the Yorkshire Electric Power Company, and an electricity supply is promised for next winter.

Shotley Bridge.—ELECTRICITY SUPPLY.—The Cleveland and Durham County Electrical Power Distribution Co. is considering a proposal to provide a supply of electricity to Shotley Bridge and district.

Siam.—BANGKOK.—The Siam Electricity Co., of Bangkok, in order to meet the increasing demand for electricity supply, has recently ordered a new 5,000-kW turbo-generator set. The old boilers are also to be replaced by new ones, a modern switchboard installed, and the distribution system re-arranged to meet present-day requirements.

South Africa.—CAPETOWN.—According to the *South African Engineer*, the electrical engineer (Mr. G. Swingler) estimates that the total sum of £200,000 will be required for extensions and reconstruction of the electrical system during this year.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Colwyn Bay Urban District Council to supply electricity in part of the rural districts of Conway and Glan Conway; the Burton-on-Trent Corporation to supply in the urban district of Swadlincote and parts of the rural districts of Repton, Hartshorne, Seals, and Tutbury; the Electrical Distribution of Yorkshire, Ltd., in the rural district of Wetherby and part of the rural district of Wharfedale; the Orford Electric Light & Power Co., Ltd., in the urban districts of Leiston-cum-Sizewell, and parts of the rural districts of Blything, Plomesgate, and Woodbridge; the Long Eaton Urban District Council in part of the urban district and part of the parish of Toton; Mr. J. A. Purves in the urban district of Bungay; and the Worthing Corporation in parts of the rural district of East Preston, Thakeham, and Steyning West.

Applications for Special Orders have been made by the following authorities:—The Southwold Electricity Supply Co., Ltd., for the supply of electricity in the borough of Southwold and part of the rural district of Blything; the Whitstable Electric Co., Ltd., to extend its area of supply so as to include part of the rural district of Blean; the Leatherhead & District Electricity Co., Ltd., to supply in parts of the rural districts of Epsom, Reigate, and Dorking; and the Torquay Corporation in parts of the rural districts of Newton Abbot and Totnes.

Stoke-on-Trent.—NEW PLANT.—The borough electrical engineer has submitted a report to the Town Council on plant extensions at the electricity works, and the Council has resolved to apply for sanction to install an additional 10,000-kW set and two new boilers, and to a loan of £160,000 to carry out the extensions.

Strathpeffer and Dingwall.—TEMPORARY REDUCTIONS.—The Strathpeffer and Dingwall Electric Co., Ltd., has decided during the duration of the coal dispute to reduce the charge for electricity for heating and cooking to 2d. per kWh. The rate also applies to dwelling houses charged on the valuation system.

United States.—BAY OF FUNDY SCHEME.—Preliminary permits for hydro-electric development on Passamaquoddy Bay, Me., involving the utilisation of the Bay of Fundy tide, have been issued by the Federal Power Commission to Dexter P. Cooper, Inc., New York City. This is the first action taken by the Commission on this proposed development, which is expected by its promoters to yield 500,000 h.p The scheme involves the construction of a number of dams between the islands at the mouth of the bay, so as to make use of the rise and fall of the tide, which amounts to more than 25 ft.—*Reuter's Trade Service* (Washington).

Wirral.—ELECTRICITY SUPPLY.—The Rural District Council has been recommended by the Electricity Committee to accept the offer of the Birkenhead Corporation for an electricity supply. Birkenhead Corporation, it is suggested, should administer the Order granted to the Rural District Council and electricity will be supplied in the Council's area on the same terms as those applying to the out-townships which the Corporation already supplies—*i.e.*, at rates 25 per cent. above those charged in the borough. Birkenhead hopes to be in a position

to supply Moreton with electricity within three months. The completed scheme will cost about £60,000.

The Birkenhead Corporation has received the sanction of the Electricity Commissioners for a " fringe " order to supply electricity to the Plymyard housing estate between Bromborough and Eastham in the Rural Council's area.

Tramway and Railway Notes.

Australia.—NEW SOUTH WALES.—According to the *Industrial Australian and Mining Standard*, the work of preparing the whole of the lines in the Sydney area for electrical operation is rapidly nearing completion (electric trains are already in operation on certain lines), but there still remain to be erected a number of sub-stations and carriage sheds. Sub-stations are being provided at St. Leonards and Gordon, on the North Shore line, and at Lewisham and Homebush, on the main line. The sub-stations at Sydenham, Hurstville, and Sutherland have been completed, and are now in use supplying energy to the trains running on the Illawarra line. On the Bankstown line a sub-station is being erected at Belmore. The large carriage sheds at Punchbowl and Mortdale have been completed, and are now in use.

Blackpool.—NEW CARS.—The Corporation proposes to spend over £15,000 on new tramcars and equipment this year.

Continental.—PORTUGAL.—The work of electrifying the steam railway between Lisbon and Casaes is rapidly approaching completion, and it is expected that the new system will be ready for operation during the coming summer.

SPAIN.—A new electric railway 23 miles in length, known as the Urola, has lately been completed between Zumarraga and Zumaya. The necessary energy is supplied at 30,000 V, three-phase, a.c. from the power station of the Sociedad Hidro-Electrica Iberica, and is converted to 1,500 V d.c. at a transformer station at Azpeitia by means of two sets of transformers and mercury rectifiers. The rolling stock consists of seven motor coaches for passenger coaches and seven motor goods wagons. Each vehicle is provided with four 75-h.p. motors, and although 1,500 V d.c. is used for traction purposes, a converter is installed on each vehicle to enable the controller, the brakes, and the lighting to be operated at 110 V.

Darlington.—RAILLESS CARS.—The Electricity and Transport Committee has appointed a sub-committee to consider and report upon the question of introducing new railless-car services.

Oldham.—TRACK RENEWALS.—The Tramways Committee has under consideration the relaying of the tramway track from Sheepfoot Lane to Royton Town Hall, at an estimated cost of £10,000.

Royton.—TRACK RENEWALS.—According to the *Electric Railway and Tramway Journal*, the Oldham Tramways Committee and representatives of the Urban District Council failed to come to an agreement with regard to the relaying of the tramway track in Oldham Road, Royton, and the running of 'buses in that district. In consequence of the deadlock an appeal has been made to the Ministry of Transport to send an inspector to act as arbitrator. The Oldham Tramways Committee is anxious to relay the length of track from Sheepfoot Lane to Royton Town Hall at a cost of at least £10,000. This increased capital expenditure would, according to the agreement entered into, mean a reduction in the rent that Oldham pays to Royton of £250 per route mile. The Council desires that the present track should be used for a year or two longer.

Sheffield.—TRAMWAY EXTENSION.—It is reported that the City Council has sanctioned the extension of the tramway to the Woodseats terminus at an estimated cost of £50,000.

South Africa.—RAILWAY ELECTRIFICATION.—The electrification of the Cape Town suburban services, just begun, marks the last stage in the 1922 development programme of the South African Railways, involving the construction of 850 miles of new track. This follows upon the electrification of the Natal main line between Glencoe and Maritzburg, which, with a track mileage of 300 miles—as far as from London to Carlisle—is now claimed to be the longest electrified main line in the world.—*Financial Times.*

Southern Railway Electrification.—*The Times* reports that the final stage of the Southern Railway's suburban electrification scheme, the total cost of which is £8,000,000, will be reached on June 6th, when electric services will be opened between Charing Cross, London Bridge, and Dartford. The new electric trains will run by way of Greenwich, Blackheath, and Woolwich, Bexley Heath, and Sidcup. This section represents a mileage of 72 track miles, and the cost of its conversion to electric traction has been about £1,100,000. With its completion, the Southern Railway will have a total electric mileage of 647 track miles, which is the largest suburban electric service in the world.

Staffordshire.—ABANDONMENT OF TRAMWAYS.—The Minister of Transport has made an Order authorising the abandonment of part of the tramway and light railways of the Potteries Electric Traction Co., Ltd., as from September 30th next.

West Ham.—TRACK RENEWALS.—The Borough Council has received from the Ministry of Transport sanction to a loan of £33,855 for the reconstruction of the tramway track in Green Street from Romford Road to Barking Road.

Telegraph and Telephone Notes.

Australia.—BALLAN " BEAM " STATION.—About half-way between Ingliston and Ballan, a few miles south of the Ballarat railway line, are the six steel towers of the Australian " beam " wireless-telegraph transmitting station. The main building at the station itself has been almost completed, and the tests will probably be carried out before August. A very short wave length, probably less than 40 metres, will be used at the Ballan station, the cost of which is likely to be less than one-third of the cost of a long-wave station; six masts, each 250 ft. in height, are required, and it is expected that the power to be used by the transmitters will be about 25 kilowatts. The site at Ballan is about 1,800 ft. above sea level, and is free from " shielding " hills. The masts stand on a plateau slightly elevated above the surrounding country. The station will consist of two separate transmitters, one for communication direct with England and one for working with Canada. Two aerial systems will be needed, each supported by three masts, and the angle of the beam will be about 45 degrees. In the morning the aerial pointing to the north-west will be in use, when the beam path to England will then be for the greater part of its length in darkness; in the evening, however, the beam will be sent in a south-easterly direction, going round the other half of the earth, which will then be in darkness. The Canadian aerial will transmit in a north-easterly direction only. All the electricity for working the transmitters as well as for domestic purposes in the cottages of the station staff will be generated at the station. Each engine and generator is set in a block of concrete which rests on a bed of compressed cork to prevent vibration being communicated to the transmitting apparatus; the concrete blocks on which the transmitters will be built will also be set on beds of cork. Messages will be transmitted from the offices of Amalgamated Wireless (Australasia), Ltd., by whom the station is owned, in Melbourne at a speed of 100 words a minute by means of a telegraph line to Ballan.—*Reuter* (Melbourne).

France.—TELEPHONE SERVICE.—The development of the Government-owned telephone system has improved since the war, but long-distance lines are wholly inadequate, while rural lines are almost unknown. The first of the five long-distance cables planned, the one to Strasbourg, is to be completed shortly. In June, 1923, the French Parliament voted to replace with automatic equipment the manual systems in a number of the larger cities. An appropriation was made for this purpose, but subsequent depreciation of the franc rendered it inadequate, though Nice, with 4,900 lines; Orleans, with 3,200 lines; and Dieppe and Vichy, with 800 lines, each, have been changed over and 5,000 lines at Le Havre have been finished, but not yet placed in operation. Contracts for the installation of automatic systems at Bordeaux and Lyon have been let and the Montpellier exchange of 3,000 lines, is under construction, as are others at Nantes, Reims, Colmar, and Fontainebleau. The Government has appropriated 210,000,000 fr. for an automatic system in Paris. The first contract will be for 40,000 lines, and ultimately there are to be 130,000, says *Commerce Reports*. Eleven new exchange buildings, to supplement the present 14, are now under construction.

JOINT COMMITTEE.—With the object of increasing the value of the telephone service to the public, the French Minister of Posts and Telegraphs in Paris recently appointed the Comitè Pratique d'Amelioration du Service Telephonique, composed of telephone users and officials of the telephone department.

Morocco.—SMALL RADIO STATION.—A small wireless telegraph receiving and transmitting installation has recently been carried out at the offices of the Spanish Consulate in Tangier to afford communication with the wireless service in Africa and with Madrid. The power of the plant is only ¼ kW, but satisfaction is expressed at the fact that it is the first all-Spanish plant to be installed.

New Atlantic Cable.—" PERMALLOY " TYPE.—Unfavourable weather delayed the landing of the English shore-end of the Western Union Telegraph Co.'s new cable from Bay Roberts, Newfoundland, to Sennen Cove, Cornwall, last week. The shore-end is about six miles in length and was landed from the steamer *Clyde Firth* on May 27th. The ocean span will be carried across to Newfoundland by the c.s. *Colonia* in July; returning to England the ship will load the final section of cable, which will be laid from Newfoundland to New York. The new " permalloy "-loaded cable, capable of transmitting 2,500 letters per minute, is the first of its kind to be landed in this country.

The Telephone Service.—DEPOSIT MONEY.—Asked in the House of Commons if he could state the amount of unclaimed deposit money held by the telephone service, Viscount Wolmer, Assistant Postmaster-General, in a written reply, states that figures are not readily available of the amount of deposit money still in the hands of the Post Office owing to inability to trace the addresses of the ex-subscribers to whom it belongs. During last year about £1,640 accumulated in this manner.

DEVELOPMENT.—In March last, just fifty years after the invention of the telephone, the total number of telephones in Great Britain and Northern Ireland was 1,421,150, of which 1,390,153 belonged to the Post Office system, 11,000 to railway and other private installations communicating with the national system, and about 20,000 to the systems maintained by Hull and the Channel Islands.

Radio Notes.

Australia.—NEW HOBART STATION.—Hobart is to have a new broadcasting station capable of transmitting throughout the Commonwealth. The existing station (7 ZL) has been taken over by the Tasmanian Broadcasters Pty., Ltd. (a company registered in Hobart last February), and will be moved to larger quarters ready for operation by July.

Holland.—STATION RE-OPENING.—It is understood that the transmitting station at The Hague is to be brought into operation again this month. At such times as Hilversum is not transmitting, PCGG will broadcast on a wave-length of 1,500 metres, and attempts are to be made to reach the Dutch East Indies on a 130-m. wave.

Japan.—NEW OSAKA STATION.—Work has commenced on a site in Otemae, where the Osaka Radio Broadcasting Bureau is to build its main station. According to *Eastern Engineering*, the site covers 754 tsubo and the term is for 20 years. At an estimated expenditure of y.690,000, the Bureau plans to build a three-storied ferro-concrete structure with three radio rooms, the first intended for foreign music, the second for Japanese music, and the third for lectures, with a battery room on the first floor of the main structure, so as to make broadcasting possible even in case of the failure of the supply of electricity. The height of the antennæ will be 250 ft. It is planned to complete the construction before the end of the year.

Netherlands East Indies.—PRELIMINARY REGULATIONS.—No new permits for radio-telegraph stations will be granted to individuals or private companies in the Netherlands East Indies, while existing or future permits to broadcast by radio-telephony are subject to cancellation, according to a statement published in the *Algemeen Indisch Dagblad*, January 22nd, 1926. There is no provision for any monopoly, either broadcasting or merchandising, but the Government may, obviously, create a monopoly of the former. The stations licensed must be capable of reaching all parts of the archipelago; private broadcasters may not interfere with Government stations, and available Government stations may be used for broadcasting upon terms to be arranged, says *Commerce Reports*.

South Africa.—LICENCES BY MONTHLY INSTALMENTS.—The Durban Town Council has introduced a scheme, on the combined recommendation of the borough electrical engineer and the town treasurer, for the payment of broadcast licence fees in monthly instalments along with the electric light account, at the rate (for the present fee of £2 5s.) of three shillings per month for ten months, the first payment of fifteen shillings being made to the Post Office as under the existing instalment scheme. The next step to be aimed at would appear to be an extension of the system to country listeners not connected to the municipal electricity mains, whose initial outlay for their receiving sets is already so much greater than that of listeners within crystal set range. The zone system of graduated licence fees (already in force in Australia) may be introduced, says the *South African Engineer*, in connection with the enlarged powers conferred on the Post Office authorities under the new regulations.

Sweden.—NEW STATION.—The Swedish Telegraph Board has concluded a contract with Marconi's Wireless Telegraph Co., Ltd., regarding the delivery of transmitting apparatus for Sweden's first big broadcasting station. The equipment, according to the *Financial Times*, will be similar to that at the English station at Daventry.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Asia Minor.—BAGDAD.—June 28th. Direction Générale des Chemins de fer d'Anatolie. One electrically-driven semi-portal crane. (A.X.3191.)*

Australia.—MELBOURNE.—June 28th. Electricity Commission of Victoria. 22,000-V transformers and spares. (B.X. 2528).*

June 16th. Victorian Government Railways. One heavy-current motor generator set. (B.X. 2527.)*

June 16th. City Council. Turbo-alternator, exciter and condensing plant.*

August 11th. H. and l.p., 3-phase sub-station switchgear.*

August 3rd. Postmaster-General's Department. Telephones and dials.*

BRISBANE.—August 26th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator.*

Belfast. — June 12th. Electricity Committee. D.c. switchgear for sub-stations and transformer kiosks. (May 28th.)

Belgium. — June 6th. The municipal authorities of Hollogne-aux-Pierres, province of Liége. Supply and laying of armoured cables to connect the various transformer cabins in the town.

Birmingham.—June 11th. Electric Supply Department. Stores, *viz.*: engineers' tools, &c., required during year commencing July 1st, 1926. Particulars from Secretary, Electric Supply Department, Dale End.

June 11th, 1926. Tramways Committee. Stores required during year commencing July 1st, 1926. Particulars from General Manager, Council House, Congreve Street.

June 21st. Board of Guardians. Installation of electric lighting at the various homes on the Monyhull Colony estate, King's Heath. Specifications from Mr. N. W. Greenway, consulting engineer, Lloyd's Bank Chambers, New Street, Birmingham.

Brazil.—PORTO ALEGRO.—July 8th. Municipal Council. Electrical material for street lighting. (B.X. 2571.)*

Bristol.—June 14th. Electricity Department. Additions to the premises at Feeder Road generating station. (May 28th.)

Burnley.—June 26th. Joint Hospital Board. Electric lighting system at the Sanatorium, Marsden Road. (See this issue.)

Dundee.—June 18th. Electricity Department. L.p. cable. (See this issue.)

Egypt.—CAIRO.—June 30th. Ministry of the Interior. One Diesel engine, direct coupled to an 80-kW generator, complete with switchboard. (B.X. 2537.)*

June 19th. Minister of Education. Dynamo and motors.*

July 10th. Director-General, State Domains Administration (Commercial Service), Savoy House, Qasr el Nil Street, Cairo. Three semi-Diesel engines and two centrifugal pumps.

August 2nd. Director-General, Mechanical Department, P.W.M., Cairo. 400-b.h.p. Diesel engine, driving an air compressor, together with auxiliary machinery.

—*Reuter's Trade Service* (Cairo).

Erith.—June 7th. Electricity Department. L.p. cables. (May 28th.)

Epsom.—June 14th. Electricity Department. Removal of boilers and setting them up as fuel tanks, overhead travelling crane, two 300-kW Diesel engine-driven generators and accessories, oil-purifying plant and cooling tower. (May 28th.)

India.—June 15th. India Store Department. 70,000 (approx.) copper bonds for track rails. (May 14th and 21st.)

June 11th. Wireless transmitting sets. Particulars from Department, 11, Belvedere Road, S.E.

Kettering.—June 9th. Electricity Department. Water-softening plant. (May 14th and 21st.)

London.—METROPOLITAN ASYLUMS BOARD.—June 16th. Installation of electric cable for arc light treatment apparatus at St. Luke's Hospital, Lowestoft. (May 28th.)

June 16th. Installation of electric lighting at the Hut Building, Pinewood, Wokingham. (See this issue.)

H.M. OFFICE OF WORKS.—June 14th. Incandescent electric lamps. (See this issue.)

Lurgan.—June 21st. Urban District Council. Oil engines and generators, motor-driven pumps, main switchboard, and underground and overhead mains. (See this issue.)

Manchester.—June 8th. Tramways Committee. One 2-ton steam travelling crane. Specification from Mr. H. Mattinson, General Manager and Chief Engineer, 55, Piccadilly.

July 7th. Electricity Department. Two 130,000-lb. water-tube boilers, flues, coal chutes, ash hoppers, pipework, valves, induced- and forced-draught plants and chimneys, one 40,000-kW turbo-alternator, with condensing plant, &c. (See this issue.)

New Zealand.—AUCKLAND.—June 21st. Electric Power Board. L.p. insulators, &c.*

Public Works Department. July 20th. Phase transformer for Mangahao electric power scheme.*

New Zealand Railway Department. June 16th. Electric motors.*

August 30th. 400-V, 3-phase, slip-ring induction motors and starters.*

Normanton (Yorkshire).—Installation of electric lighting at Normanton Wesleyan Church. A. Harris, 23a, High Street, Normanton, Yorkshire.

Otley.—Electric lighting installation at public slaughter houses, Station Road. Quantities, &c., from surveyor to U.D.C., Council Offices.

Rhyl.—June 16th. Electricity Department. 1,000 yd. l.p. armoured cable, 1,915 yd. 11,000-V feeder cable, and switchgear equipment. (May 28th.)

Roumania.—BUCHAREST.—June 8th. Bucharest Tramway Co. 10,000 kg. electrodes, 1,000 kg. electrolytic copper, 3,000 electrolytic copper contact pieces, 1,200 kg. copper plates, 200 kg. brass sheets, 2,500 kg. black insulating varnish.*

South Africa.—June 21st. South African Railways and Harbours. Track bonds for the Cape Town Suburban Railway electrification scheme. (May 28th.)

July 8th. Telegraph material, poles, cross arms, &c. (A.X. 3,173.)*

Stoke-on-Trent. — June 9th. Electricity Department. Two 60,000-lb. per hour water-tube boilers. (May 14th and 21st.)

Uruguay. — MONTEVIDEO. — July 6th. State Electricity Works. 1,000,000 metres of insulated conductors. (B.X. 2523.)*

July 9th. 137,500 metres rubber-insulated wires and cables. (B.X. 2548.)*

40,000 metres of coloured twin conductor cords. (B.X. 2549.)*

July 22nd. 35,000 electric lamps.*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Ardsley (East and West).—District Council. Accepted:—
Electrical installation in 40 " D " type and eight scullery houses (£161).—Radio Electric Co.

Australia.—SYDNEY.—With further reference to the note on page 801, ELECTRICAL REVIEW, May 28th, *Tenders* states that a special meeting of the City Council was held recently to receive and consider the report of the committee appointed in connection with the acceptance of tenders for armour-clad switchgear, 33,000-V transformers, and 33,000-V cable. In the case of offers for armour-clad switchgear for 33,000-V step-down sub-stations, it was agreed to cable the general manager, Mr. H. R. Forbes Mackay, asking him to inspect the 33,000-V installation carried out by Messrs. Ferguson, Pailin, Ltd., at the Manchester Corporation power station, and reply as to the suitability of this equipment for Australia. The original motion was for the acceptance of the tender of Metropolitan-Vickers Electrical Co., Ltd. (second lowest) at £106,038. Messrs. Ferguson, Pailin's offer was £99,760. The latest information to hand is that, at a further meeting of the Council, decision was deferred pending the receipt of cabled advice from Mr. Mackay.

For the supply of 33,000-V transformers, the following offers were accepted :—
Section A, three 10,000-kVA, 33,000-5,350-V forced oil cooled (£12,014); section B, ditto, air cooled (£13,840).—Noyes Bros. (Sydney), Ltd.
Section C (£7,420); ditto E (£10,820); ditto F (£7,000); ditto G (£7,000); ditto H (£7,000); section D (£7,000).—Electrical Plant Manufacturers, Ltd.

For 33,000-V cable, tenders were accepted as follows :—
Item 1, 137,000 yd. .25 sq. in. 3-core, paper insulated, lead covered and armoured (£244,347).—Noyes Bros. (Sydney), Ltd.
Item 2, 17,500 yd. 15 sq. in. 3-core p.i. l.c. and double wire armoured (£27,090); item 3, 47,500 yd. ditto, single wire armoured (£59,137).—British Insulated Cables, Ltd.
Item 4, 75,000 yd. each 7/.036, 3-core and 3 pairs 19 s.w.g. telephone wires, paper insulated, lead covered, armoured pilot and telephone cable (£15,094).—Siemens (Aust.) Pty., Ltd.; (£14,475), Johnson and Phillips, Ltd.
Item 5, 47,000 yd. ditto unarmoured (£6,306).—Johnson & Phillips, Ltd.

Electric Lighting Committee. 18 boilers and accessories. Recommended :—

Babcock & Wilcox, Ltd. (Recommended)	**£622,877**
Sterling Boiler Co., Ltd.	£623,730
Vickers Boiler Co., Ltd.	£624,365
Sir W. G. Armstrong, Whitworth & Co., Ltd.	£624,812
International Combustion Co., Ltd.	£633,348
Australian Commonwealth Shipping Board	£1,035,606

Mechanical draught plant (£98,833).—Australian Commonwealth Shipping Board (recommended).

MELBOURNE.—Postmaster-General's Department.
Telephone apparatus.—Siemens Bros. & Co., Ltd. (£1,377); British L. M. Ericsson Mfg. Co., Ltd. (£682).
Equipment in connection with the establishment of a radiophone service between Townsville and Magnetic Island (£548).—Amalgamated Wireless (Aust.), Ltd.
—*Tenders.*

Brighton.—Electricity Committee. Recommended:—
1,500-gallons per hour water-softening equipment (£962).—Kennicott Water Softening Co., Ltd.
Switchboard (£216).—Bruce Peebles & Co., Ltd.
Pipes and castings (£815).—Smith, Patterson & Co., Ltd.

Bridlington.—
Electrical installation at new Spa concert hall (£750).—City Electrical Co.

Chesterfield.—Electricity Committee. Accepted:—
Underground cable (£235).—Standard Telephones & Cables, Ltd.
Overhead line material (£232).—British Insulated Cables, Ltd.

Crieff.—
Electric lighting installation in connection with the new Baptist Church.—Mark Aitken & Sons.

Glasgow.—Watching and Lighting Committee. Accepted :—
Electrical fittings and accessories, &c., for 12 months.—Wm. McGeoch and Co., Ltd.; Simplex Conduits, Ltd.; Thos. Land & Son; Chalmers & Mitchell; Edison Swan Electric Co., Ltd.; Enfield Cable Works, Ltd.; W. Brown & Co. (Engineers), Ltd.; Credenda Conduits Co., Ltd.; Bayliss, March & Newey, Ltd.

Corporation. Recommended :—
Laying the cables in the grounds at Bellefield Sanatorium (£1,593).—Callender's Cable & Construction Co., Ltd.

Government Contracts.—The following Government contracts were placed during April, 1926 :—

ADMIRALTY (CONTRACT AND PURCHASE DEPARTMENT).
Electric cable.—W. T. Glover & Co., Ltd.
Electric fires.—Berry's Electric, Ltd.
Aerial insulators.—G. H. Williams & Co.
Motor generators.—Newton Bros. (Derby), Ltd.
Switches.—Whipp & Bourne, Ltd.
Electric tractor.—Electromobile, Ltd.
W/T. transmitters.—Gambrell Bros., Ltd.; H. W. Sullivan, Ltd.; Plessy Co. (1925), Ltd.
Enamelled copper wire.—British Insulated Cables, Ltd.
W/T. boards.—Dorman & Smith, Ltd.; Whipp & Bourne, Ltd.; Veritys, Ltd.
W/T. fittings.—Player & Mitchell.
Lamp ferrules.—Edison Swan Electric Co., Ltd.

WAR OFFICE.
Wireless valves.—British Thomson-Houston Co., Ltd.

AIR MINISTRY.
Electric lighting (Spittlegate).—Malcolm & Allan, Ltd.
W/T. receivers.—H. W. Sullivan, Ltd.
Transmitters and receivers.—Gambrell Bros., Ltd.
Wavemeters.—H. W. Sullivan, Ltd.
Inert batteries.—Edison Swan Electric Co., Ltd.

POST OFFICE.
Manufacture, supply, drawing-in and jointing cable.—Rushden-Finedon Junction : Standard Telephones & Cables, Ltd.
Installing and jointing loading coils and terminating cable.—Ipswich-Marks Tey : Johnson & Phillips, Ltd.
Direction-finding apparatus.—Wick Wireless Station : Marconi's Wireless Telegraph Co., Ltd.
Telephone exchange equipment.—Blackpool, Dundee, Broughty Ferry : General Electric Co., Ltd. Grangewood (East Ham) : British L.M. Ericsson Mfg. Co., Ltd. Malden, Primrose Hill : Automatic Telephone Mfg. Co., Ltd. Kingston, Bournemouth : Standard Telephones and Cables, Ltd.
Private branch exchange equipment.—J. Heywood, Ltd. (Manchester); E. Pollard & Co., Ltd. (E.C.); Shoreditch Borough Council; Edmonton Board of Guardians; Morris Commercial Cars, Ltd. (Smethwick); Transport and General Workers' Union (S.W.); J. Henshelwood and Co., Ltd. (Glasgow); *Bristol Times and Mirror, Ltd.*—Relay Automatic Telephone Co., Ltd.
Telephone repeater station (repeater equipment).—Canterbury : General Electric Co., Ltd. Fenny Stratford, Derby : Standard Telephones and Cables, Ltd.
Telegraph apparatus.—Creed & Co., Ltd.; Standard Telephones & Cables, Ltd.
Telephone apparatus.—British L.M. Ericsson Mfg. Co., Ltd.; International Electric Co., Ltd.; C. Lange; Standard Telephones & Cables, Ltd.; Sterling Telephone & Electric Co., Ltd.; Telephone Mfg. Co., Ltd.
Testing and protective apparatus.—Evershed & Vignoles, Ltd.; Power Equipment Co., Ltd.; Standard Telephones & Cables, Ltd.
Terminal Blocks.—T. De la Rue & Co., Ltd.
Battery boxes.—British L.M. Ericsson Mfg. Co., Ltd.
Cable (various).—Connolly's (Blackley), Ltd.; Enfield Cable Co., Ltd.; Hackbridge Cable Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Siemens Bros. & Co., Ltd.
Lamp caps.—W. Johnson.
Wood casing.—Duncan Tucker & Sons, Ltd.
Joint box castings.—Ladywood Ironworks, Ltd.; McDowall, Steven and Co., Ltd.
Loading coils.—Siemens Bros. & Co., Ltd.
Telephone cords.—Peel-Conner Telephone Works; Phœnix Telephone and Electric Works, Ltd.; Siemens Bros. & Co., Ltd.; Ward & Goldstone, Ltd.
Ducts.—James Oakes & Co., Ltd.; Standard Brick & Terra Cotta Co., Ltd.
Battery sections.—Accumulators of Woking, Ltd.
Cadmium copper wire.—T. Bolton & Sons, Ltd.; R. Johnson & Nephew, Ltd.
H.d. copper wire.—British Insulated Cables, Ltd.; T. Bolton & Sons, Ltd.; Elliott's Metal Co., Ltd.; Johnson & Nephew, Ltd.; E. & E. Kaye, Ltd.; Nevill, Druce & Co., Ltd.; Pirelli-General Cable Works, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co., incorporated in the London Electric Wire Co. & Smiths, Ltd.; Wilkes, Son & Mapplebeck, Ltd.
V.i.r. wire.—Callender's Cable & Construction Co., Ltd.
Switches.—Edison Swan Electric Co., Ltd.

CROWN AGENTS FOR THE COLONIES.

Bronze and copper wire.—Elliott's Metal Co., Ltd.; Shropshire Iron Co., Ltd.
Copper wire.—F. Smith & Co.

Halifax.—
Electrical installation at houses in Stamps Lane.—Mr. H. J. Westlake.

Hornsey.—Electricity Committee. Recommended:—
500 fuse boxes (£437).—Motor Gear & Engineering Co.

Irish Free State.—The following contracts were placed by the Controller of Stores (Posts and Telegraphs) from March 23rd-April 22nd :—
Cable and accessories.—W. T. Henley's Telegraph Works Co., Ltd.
Enamelled copper wire.—Hayward Co.
Telephone fuses.—Phœnix Telephone and Electric Works, Ltd.
Telephones.—Siemens Brothers & Co., Ltd.
Telephone accessories.—Standard Telephones and Cables, Ltd.; Sterling Telephone and Electric Co., Ltd.; International Electric Co., Ltd.; Cook Electric Co.; W. J. Kellie. —*Irish Electrician.*

DUBLIN.—Borough Commissioners. Accepted :—
H.p. switchgear, &c., for Fleet Street and Pigeon House generating stations (£11,305).—Ferguson Pailin, Ltd.
—*Irish Builder and Engineer.*

India.—*Reuter* states that a contract for the complete electrical equipment of the new power house at Lucknow (East Indian Railway) has been placed with the General Electric Co. of India, Ltd.

Kidderminster.—General Hospital Management Committee. Accepted :—
Installation of an automatic telephone system throughout the hospital.—Mr. G. L. Harvey.

Lancashire.—South Lancashire Tramways Co. Accepted :—
Twelve 50-h.p. tramcar motors.—General Electric Co., Ltd.

Leeds.—Tramways Committee. Accepted :—
Tramcar tires.—Steel, Peech & Tozer, Ltd.
Electrodes.—Consolidated Pneumatic Tool Co., Ltd.; Allen Liversidge, Ltd.; Alloy Welding Processes, Ltd.
Tie bars.—Hadfields, Ltd.
Thermit joint material and plant.—Thermit, Ltd.
Rails with fish plates (350 tons approx.).—Cargo Fleet Iron Co., Ltd.
Manganese steel rails (£85).—Edgar Allen & Co., Ltd.
200 tramcar meters.—Ferranti, Ltd.
Malleable iron castings.—Leys Malleable Castings Co., Ltd.

Electricity Committee. Accepted :—
Cables.—(£2,948).—Macintosh Cable Co., Ltd., (£1,481) Enfield Cable Works, Ltd., (£2,948) W. T. Henley's Telegraph Works Co., Ltd.

Baths Committee. Accepted :—
Electrification of lifts at Town Hall (£312) and at Municipal Buildings (£578).—Waygood Otis, Ltd.

Leicester.—Electricity Committee. Recommended:—
15,000-kW turbo-alternator (£28,000).—Oerlikon, Ltd.
The most favourable British offer was £43,327.

London.—LONDON COUNTY COUNCIL.—Accepted :—
Electric incandescent lamps for 12 months.—Siemens & English Electric Lamp Co., Ltd.

BATTERSEA.—Electricity Committee. Recommended :—
Alterations and additions to condensing water system at generating station (£27,746).—Foundation Co., Ltd.

Manchester.—Electricity Committee. Accepted:—
Cable.—Pirelli-General Cable Works, Ltd., and Callender's Cable and Construction Co., Ltd.
Switchgear.—Ferguson, Pailin, Ltd.
33,000-V feeder protective gear.—A. Reyrolle & Co., Ltd.
5-ton electric tipping wagon.—Richard Garrett & Sons, Ltd.
10-ton electric tractor and trailer.—General Vehicle Co., Ltd.
Steelwork for boiler at Barton.—John Booth & Sons.

Gas Committee. Accepted :—
Three water-tube boilers.—Sterling Boiler Co., Ltd.
Two 250-kW steam engines.—Brown, Lindley & Co., Ltd.
Two 250-kW open-type dynamos.—Electric Construction Co., Ltd.

Tramways Committee. Accepted :—
Vestibule tramcar bodies.—English Electric Co., Ltd.
Maximum traction trucks.—Brush Electrical Engineering Co., Ltd.
Tramcar motors and controllers.—British Thomson-Houston Co., Ltd.
Fifty 50-h.p. tramcar motors.—General Electric Co., Ltd.

Mansfield.—Town Council. Accepted:—
Electric wiring of the hospital.—G. Hooke & Co.

Rathmines.—Urban District Council. Accepted:—
Meters for 12 months.—Edison Swan Electric Co., Ltd.

Salford.—Electricity Committee. Recommended:—
8,500 yd. l.p. cable (£2,871), 436 yd. l.p. cable (£272); and 2,612 yd. e.h.p. cable (£838).—N.V. Nederlandsche Kabelfabriek, Delft, Holland.

South Africa.—CAPE TOWN.—Electricity Committee. Accepted :—
Cable.—(£826) Bartle & Co., (£4,521) W. T. Henley's Telegraph Works Co., Ltd., (£7,253) Telegraph Mfg. Co., Ltd.
Overhead material, poles, cross-arms, &c.—(£6,793) Hubert Davies and Co., Ltd. (£607) British General Electric Co., Ltd., (£822) Telegraph Mfg. Co., Ltd., (£248) Griffin Engineering Co., Ltd., (£649) Mr. C. E. Scott, (£1,489) A. Vaux, Ltd., (£647) Davis & Soper, Ltd.

Recommended :—
7,500/8,000-kW turbo-alternator (£21,006).—Metropolitan-Vickers Electrical Co., Ltd.

Stirling.—Town Council. Accepted:—
Installing electric light in connection with the Drip Road housing scheme.—Mr. David Henderson.
Electrical work at the Guildhall House.—W. & T. Marshall.

Tynemouth.—Electricity Committee. Accepted:—
Cable (£1,065).—Standard Telephones & Cables, Ltd.

Forthcoming Events.

Royal Institution of Great Britain.—Monday, June 5th. At 21, Albemarle Street, W. At 5 p.m. General meeting.
Friday, June 11th. At 9 p.m. Lecture on "The Spectrum of the Aurora," by Prof. J. C. McLennan, F.R.S.
Institute of Physics.—Monday, June 7th. At the Royal College of Science, South Kensington, S.W. At 5.30 p.m. Lecture on "The Relationship of Physics to Aeronautical Research," by Mr. H. E. Wimperis.
Roentgen Society.—Tuesday, June 8th. At 32, Welbeck Street, W.1. At 8.15 p.m. Annual general meeting and ordinary general meeting.
Radio Society of Great Britain.—Wednesday, June 9th. At the Institution of Electrical Engineers, Savoy Place, W.C. At 6 p.m. Informal meeting.
Salford Technical and Engineering Association.—Saturday, June 12th. Visit to Ferranti, Ltd., Hollinwood.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following :—

ELTRON immersion heaters.
IMPERIAL vacuum cleaners (American).
LATALOID insulation.
ORANGBURG fibre conduit.
RICHMOND vacuum cleaners.
Electric iron stands fitted with springs to absorb shock.

Notes.

How Electricity Supply was Maintained During the Strike.—CORRECTIONS.—In our article on "How Electricity Supply was Maintained During the Strike" the remark that the "Men at Rotherham remained at work as the result of an arrangement with the E.P.E.A. members not to supply the tramways" (page 783, May 28th issue) was somewhat misleading, for we understand that, as the whole of the operating staff there, both technical and manual, were not connected with unions affiliated with the T.U.C., there was no question of them ceasing work.

The statement that in the North Metropolitan Electric Power Supply Company's area the supply was maintained by volunteers and naval men. This was a regrettable error, as our information, since confirmed by Capt. Donaldson, was that all the volunteers employed by the "North Met." offered their services directly to the company, and that the latter did not draw on the Government, either for naval ratings or for volunteers.

National Association of Supervising Electricians.—The meeting arranged for May 4th, to decide the winning papers in connection with the W. E. Highfield Shield Competition, which was postponed owing to the general strike, has now been arranged for Thursday, June 10th, at the Junior Institution of Engineers, London, at 7.15 p.m. The president, Mr. A. M. Sillar, M.Inst.C.E., will be in the chair.

Electrical Engineers in China.—We have received from Mr. C. S. Taylor, hon. secretary and treasurer of the China Centre, Institution of Electrical Engineers, a photograph (reproduced herewith) taken on the occasion of the second annual conference which was held in Shanghai on April 17th last. The programme of the Conference included visits to the Shanghai Electric Construction Co.'s depôt and workshop, to the Tonquin Road super sub-station of the Shanghai Municipal

The China Centre, I.E.E., Conference Dinner.

Electricity Department, to flour and cotton mills, and to the generating station of the Cie. Française de Tramways et d'Eclairage Electriques.

Electricity Supply from Oil Fuel.—The Brompton and Kensington Electricity Supply Co., Ltd., has circulated to its consumers, numbering about 10,000, notice that as the electrical energy supplied by it is generated exclusively by oil fuel, the restriction in consumption required by the Government Order does not apply to its consumers, who are therefore not called upon to practise the economy demanded by the shortage of coal. The company and its consumers are to be congratulated on their independence of coal, an advantage which is shared by the many oil-engine stations which are in operation.

Appointments Vacant.—Mains assistant (£150), for the Cheadle and Gatley U.D.C. electricity department; works superintendent, for the Borough of Newport (Mon.) Electricity Department. Plumber-jointer for the Watford Corporation Electricity Department. (See our advertisement pages to-day.)

Association of Mining Electrical Engineers.—Owing to the disturbed state of the coal trade, it has been decided to cancel the social functions arranged in connection with the annual meeting of the Association at Harrogate. The Council and general meetings will be held there, at 4 p.m. to-day and 10 a.m. to-morrow, for the transaction of formal business only.

Aylesbury Rural Electricity Development.—On Saturday last Mrs. Ll. B. Atkinson, a member of the Council of the Electrical Association for Women, cut the first sod in connection with the Corporation's rural area electricity scheme, in Chequers Park, Aylesbury. The contractors for the scheme (the Craven and District Electrical Construction Co., Ltd.) presented Mrs. Atkinson with a silver spade for the occasion. During the afternoon Mr. Borlase Matthews gave some interesting information with regard to the value of electricity to the farmer, and said that the courageous step which was being taken by the Aylesbury Electricity Committee was one of great significance in the electrical and farming worlds. Mr. Ll. Atkinson thanked the compauy on behalf of his wife, and referred to the excellent work carried out by Mr. W. A. Turnbull, the borough electrical engineer. The Mayor (Alderman C. F. Atkins, J.P.) joined in wishing the enterprise great success, and other speeches were made by Alderman James Robinson, J.P., chairman of the Electricity Committee, and Councillor Viscount Stopford, O.B.E., vice-chairman. At the end of the ceremony, which was held in a most delightful country field, the guests were

entertained to tea in a barn near by. In addition to local people, the party consisted of Mr. W. M. Selvey, consulting engineer, Miss Phyllis Atkinson, Mrs. M. L. Matthews, and Miss Haslett, of the Electrical Association for Women.

Electric Cooking on Board Ship.—The London and North-Eastern Railway Co. informs us that its night mail steamers between Parkeston Quay and Antwerp are now all fitted with electric kitchens.

The I.M.E.A. and the Electricity (Supply) Bill.—At a special general meeting of the Incorporated Municipal Electrical Association which was held at the Institution of Electrical Engineers on May 28th, the following resolution was passed :—

" The I.M.E.A. having considered the proposals of the Electricity (Supply) Bill, 1926, believe that in its present form it will not attain the object for which it is being promoted, *viz.*, cheaper electricity to the consumers, which is a forerunner to its more widespread use. The proposals of the Bill are too cumbersome, as well as costly and unworkable, and the Association considers that before any legislation is proceeded with representatives appointed by the electricity supply industry should be consulted and given an opportunity of submitting proposals as to the most satisfactory manner of effecting any desired improvement.

" The Association further is of the opinion that the figures in, and conclusions of, the ' Weir ' Report are open to serious doubt, and also deprecates the suppression of the ' Merz ' Report and the undue haste with which the Government has pressed the scheme."

Institution Notes.

Institution of Electrical Engineers.—The following have been nominated by the Council for the vacancies which will occur on September 30th, 1926 :—President : W. H. Eccles, D.Sc., F.R.S. Vice-President : Col. T. F. Purves, O.B.E. Hon. Treasurer : Lieut.-Col. F. A. Cortez Leigh, T.D., R.E. Ordinary Members of Council : A. C. Cramb, A. H. Railing, D.Eng., S. Parker Smith, D.Sc., A. J. Stubbs; Associate Member, F. W. Crawter.

PREMIUM AWARDS.—The Council has awarded the following premiums for papers read or accepted for publication during the 1925-26 session :—The Institution premium to Mr. L. C. Grant; Ayrton premium to Mr. S. Mavor; Fahie premium to Messrs. B. S. Cohen, A. J. Aldridge, and W. West, B.A.; John Hopkinson premium to Mr. S. Ferguson; Kelvin premium to Mr. P. Dunsheath, O.B.E., M.A., B.Sc.; Paris premium to Mr. T. Carter; extra premiums to Prof. S. P. Smith, D.Sc., Messrs. J. L. Thompson, M.Sc., and H. Walmsley, and Dr. A. B. Wood; wireless premiums to Messrs. R. A. Watson-Watt and J. F. Herd, Mr. J. Hollingworth, and Dr. R. L. Smith-Rose, Ph.D., M.Sc., and Mr. R. H. Barfield, M.Sc.

Institution of Mining Engineers.—It is announced that the general meeting of the above Institution, which was provisionally arranged to be held on June 15th and following days at Newcastle-upon-Tyne, has been postponed to later dates, possibly in the early autumn, to be announced later.

Institute of Physics.—The lecture by Mr. H. E. Wimperis on " The Relationship of Physics to Aeronautical Research," which was to have been held on May 11th, will be given on Monday, June 7th, at 5.30 p.m. in the Physics Lecture Theatre, Royal College of Science, South Kensington.

Faraday Society.—The general discussion on " Explosive Reactions in Gaseous Media," postponed from May 13th, will be held on Monday, June 14th.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Mr. R. W. DALTON, H.M. Senior Trade Commissioner in Australia, has arrived in this country for the purpose of an official visit. He will be in attendance at the offices of the Department of Overseas Trade for one month from May 31st, during which period he will be pleased to meet representatives of United Kingdom firms interested in the export of British goods to Australia. Applications for interviews should be made at once to the Comptroller-General at the Department, 35, Old Queen Street, London, S.W.1.

An Australian contemporary states that Mr. G. A. JULIUS has been appointed chairman of the Australian Commonwealth Engineering Standards Association for 1926.

According to the *Industrial Australian and Mining Standard*, Mr. H. S. VOGAN, assistant engineer in chief for existing lines in the N.S.W. Railways Department, has retired from the service and his place has been taken by Mr. W. B. HUDSON, chief assistant engineer, who has been, and will continue to be, responsible for the supervision of the electrification of the suburban lines, and the construction of the new works at Chullora.

Mr. W. J. LIBERTY, public lighting superintendent for the City of London, has resigned his office (under the Corporation Pension Scheme) after forty-seven years' service, having reached the retiring age.

The Stoke Newington B.C. has passed a vote of thanks to Mr. HANN, the borough electrical engineer, for his return to duty during the strike. He was in Switzerland on sick leave and promptly returned and assumed charge of the station.

We understand that Mr. E. F. DARKER, who recently represented the Benjamin Electric, Ltd., in London, is now with the Cape Town Corporation Electricity Department.

According to the *Sydney Daily Telegraph*, the Sydney City Council Electricity Committee has recommended the appointment of Mr. W. RILEY, superintendent of the electricity accounts branch, to the position of sales superintendent, at a salary of £800 per annum.

Mr. H. BURROWS has joined the Mersey Cable Works, Ltd., and all communications should be addressed to him there (Linacre Lane, Bootle).

Mr. FREDERICK C. DAIN has just taken up an appointment under the Blackburn Corporation electricity department as showrooms manager. He was previously on the sales staff of the Manchester Corporation electricity department.

The Halifax Electricity Committee recommends that the salary of the borough electrical engineer be increased to £1,200 per annum from June 1st.

Guildford Town Council has increased the salary of Mr. M. J. DOWNING, mains superintendent foreman, from £247 to £275 per annum.

Mr. JOHN MCLELLAN, A.M.I.E.E., who has been for many years connected with Messrs. Simplex Conduits, Ltd., and for the last few years sales superintendent for the company for the North of England, has severed his connection with the company and commenced a re-selling agency business in Manchester. His address is 78, Park Road, Southport.

According to *The Times*, acting on medical advice, Mr. W. F. SADLER, special director and general manager of Vickers, Ltd., has had to resign those positions.

According to a local newspaper report, the Lighting Committee of the Kingston-on-Thames Town Council reports that on May 6th the engagement of Mr. J. BATCHELOR as chief assistant at the electricity works was terminated forthwith.

Obituary.—MR. CARL HERING.—We regret to learn from the *Electrical World* that Mr. Carl Hering passed away suddenly on May 10th at the age of 66 years. A day or two before he had entered the Hahnemann Hospital, Philadelphia, to rest with heart trouble, and he passed away while picking up a telephone receiver, ten minutes after chatting with his physician. He had had a lengthy and distinguished career in electrical science and engineering. In the electrochemical and electrometallurgical fields especially he achieved international distinction, his discovery of the " pinch " effect being his greatest accomplishment, though by no means his only one. In 1892 he served as technical editor of the *Electrical World*. He originated and for many years conducted the " Digest of Current Electrical Literature " of that periodical. Carl Hering graduated from the University of Pennsylvania in 1880 in mechanical engineering. In 1882, while teaching at the university, he began the study of electrical engineering. In 1883 he published his first technical article, the precursor of a long series of writings, including at least eight books and innumerable papers read before technical societies and contributions to the engineering Press. He acted as a juror for many electrical exhibitions in Europe and at home. He began a course in electrical engineering at Darmstadt, Germany, in 1884. In 1885 he became chief electrical engineer for a German manufacturing company which made and installed motors and dynamos, but he soon returned to his native country, where as early as 1886 he began practice as a consulting electrical engineer in Philadelphia; he therefore lived to complete 40 years in this occupation. Our contemporary says that " Dr. Hering was all his life an enthusiastic searcher for a scientific explanation of apparent exceptions to generally accepted physical laws, and as an outcome of this trait he became a stickler for the correct expression of scientific results in standard units and contributed considerably to the construction and classification of electrical nomenclature." His work in electrochemistry dates back to some tests in 1900 for the reduction of arsenic ore. " Some six years later, while designing and operating electric furnaces, he began a series of experiments which resulted in the announcement of the discovery of a new internal electromagnetic force tending to contract a conductor through which current is flowing even to the extent of rupture when it is a fluid. This discovery was the ' pinch ' effect, already referred to. He later demonstrated the existence of other effects showing that the electromagnetic forces act on the material of the conductor. In 1909 he applied these forces to impart rapid motion to masses of molten material, and on this principle invented an electric furnace which is now in wide commercial use. As early as 1883 he began the computation of conversion factors of electrical and mechanical energy, and he published a comprehensive book on this subject in 1904. A few years later he made a recalculation of all electrochemical equivalents. In 1908 he made an analysis of the interrelations of the various quantities of units entering into the calculation of light phenomena. In the same year he described an experiment purporting to demonstrate a hitherto unrecognised factor in electromagnetic induction to show that Maxwell's well-known law of induction should be modified in order to acquire the status of a universal law." Dr. Hering was one of three men who in 1901 laid the plans for the organisation of the American Electrochemical Society. In 1900 he was elected president of the American Institute of Electrical Engineers and presided at a session held abroad. In 1906 he was president of the American Electrochemical Society. It was our privilege to be in close

conference with Dr. Hering during some of his visits to this country, and we can testify to his charming personality, his geniality and courtesy, as well as to his cordiality and assiduity in correspondence on technical subjects in which he was so absorbingly interested.

MR. G. MOILLIET.—A message has been received by cablegram from Japan stating that Mr. Georges Moilliet, the manager of the Tokio office of Boving & Co., Ltd., succumbed to typhoid on May 17th. The deceased was of French-Swiss origin, and was educated at the "Polytechnicum" at Zurich, but Yorkshire is the home of the Moilliets in this country. Mr. Moilliet became associated with Mr. Boving in 1898. He specialised in water power plants, and during his period of training he was in the employ of Escher Wyss & Co., of Zurich, and A.B. Karlstads Mekaniska Verkstad, Kristinehamn, Sweden. In 1908 he took up the position of residential engineer of Boving & Co. in Japan, and his advice on hydraulic power plants was widely sought.

MR. H. F. ALBRIGHT.—The *Electrical World* records the death, on May 11th, of Mr. Henry F. Albright, vice-president in charge of manufacturing and a director of the Western Electric Co. At the time of his death Mr. Albright was in charge of all the company's manufacturing and plant engineering activities.

MR. R. S. RILEY.—The same journal also reports that Mr. R. Sanford Riley, president of the Riley Stoker Corporation, and a distinguished combustion engineer, died on May 7th. Mr. Riley was born in Hamilton, Ontario, in 1875. His most notable work was the development of the Taylor stoker, and the invention of the stoker bearing his name. He was connected with the Riley Stoker Co., Ltd., in this country.

MR. J. L. JONES.—Messrs. A. Reyrolle & Co., Ltd., state that they regret to report the death of Mr. J. Lyons Jones, who has of recent years been in charge of their department dealing with wall plugs and other stock articles. He had been with the company for 18 years. He had been ailing for some time and had only recently recovered from pneumonia when he contracted a fatal chill in travelling to the coast by boat during the strike.

MR. A. H. FELTON.—A newspaper report states that Mr. Arthur Harold Felton (47), superintendent of the East Usk power station, Newport (Mon.), died while playing lawn tennis at St. Julian's.

Mr. C. H. FRYER.—We regret to learn that Mr. Charles H. Fryer, manager of the Glasgow branch of Messrs. Houghton-Butcher (Great Britain), Ltd., for over 20 years, passed away on May 20th.

Mr. ROBERT TAYLOR.—We have to record the death, which occurred on May 21st, at the age of 71 years, of Mr. Robert Taylor, founder, and director for 25 years, of the Liverpool Electric Cable Co., Ltd.

Wills.—The late Mr. GEORGE BERRY, manager of the British Electric Transformer Co., Ltd., left £10,813 (net personalty £2,635).

The late SIR HENRY MANCE left £22,325 gross, and £22,183 net personalty.

New Companies Registered.

Smith & Sturt, Ltd. (213,999).—Private company. Registered May 27th. Capital, £500 in £1 shares. Objects: To carry on the business of electricians, mechanical engineers, suppliers of electricity for light, heat, motive power or otherwise, &c. The directors are:—W. A. Smith, 28, Avenue Road, Leamington, Warwickshire; M. A. S. Sturt, D.S.O., 288, Mansell Road, Small Heath, Birmingham; and J. A. Stevens, 2b, Shoot-up-Hill, N.W.2 (director of J. A. Stevens, Ltd.). The first two named are permanent. Registered office: 192, Corporation Street, Birmingham.

Mirrlees Watson Co., Ltd. (14,155).—Private company. Registered in Edinburgh on May 20th. Capital, £100 in £1 shares. Objects: To carry on the business of mechanical, electrical, hydraulic and marine engineers, ship and boat builders, manufacturers of locomotive engines, &c. The directors are:—A. F. Baird, 124, St. Vincent Street, Glasgow, solicitor; C. Day, Highfield, Mile End, Stockport, engineer; H. N. Bickerton, Thorneycroft Hall, Siddington, Cheshire, engineer; C. Ker, Milngavie, Glasgow, C.A.; A. Lamberton, Easterhouse, near Glasgow, engineer; W. S. Herriott, 12, Woodrow Road, Pollokshields, engineer; and W. A. Dexter, 7, Knowe Terrace, Shields Road, Pollokshields, Glasgow, engineer. Solicitors: Boots, Edgar and Rylands. Registered office: 45, Scotland Street, Glasgow.

Battery Supplies, Ltd. (213,940).—Private company. Registered May 26th. Capital, £500 in £1 shares. Objects: To acquire the business of electrical engineers carried on as the "Accumulator Charging Service Co." at Cumberland Works, Forest Road, Kew Gardens. The first directors are:—J. Golding, 65, Mortlake Road, Kew Gardens (managing director); G. J. L. Armitage, 27, Burlington Avenue, Kew Gardens; H. P. Middleton, 62, Defoe Avenue, Kew Gardens (chairman); and D. E. Bowden, 62, Defoe Avenue, Kew Gardens. Qualification, £10. Secretary: G. J. L. Armitage. Solicitors: Wright & Son, 9, Gray's Inn Square, W.C.1. Registered office: Cumberland Works, Forest Road, Kew Gardens, Surrey.

Wholesale Electrical Supplies (Salford), Ltd. (213,855).—Private company. Registered May 19th. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in electrical goods and wireless apparatus, glassware, &c. The first directors are:—A. E. Jones (chairman), "Clairmont," Gledhow Lane, Chapel Allerton, Leeds; W. Walker, 7, East Parade, Leeds.

Mersey Cable Works, Ltd. (213,994).—Private company. Registered May 27th. Capital, £40,000 in 10,000 7½ per cent. cumulative preference and 30,000 ordinary shares of £1 each. The preference shares take priority in a winding up for arrears of dividend and return of capital. Each share confers one vote, provided that preference shareholders may vote only when their dividends are six months in arrear or when a resolution affecting their rights is proposed. Objects: To carry on the business of manufacturers of electric wires and cables, electrical, magnetic, galvanic and other apparatus, &c. The subscribers (each signing for one ordinary share) are:—Wilfred Stephen Taylor, 9, Caithness Drive, Wallasey, Cheshire, electrical engineer; and Henry Burrows, 5, Harold Street, Egremont, Cheshire, electrical engineer. The first directors, to number not fewer than two nor more than five, are W. S. Taylor (permanent) and two others to be nominated by the subscribers. Qualification, 1,000 ordinary shares. Remuneration as fixed by the company (subject to any agreement). Solicitor: E. B. Driffield, 20, Castle Street, Liverpool. Registered office: Mersey Cable Works, Linacre Lane, Bootle, near Liverpool.

Official Returns of Electrical Companies.

Middlesbrough Steel Tube and Conduit Co., Ltd.—Issue on April 19th, 1926, of £700 debentures, part of a series already registered.

C. F. Palmer (London), Ltd.—Particulars filed on May 17th of £2,000 debentures, authorised January 20th, 1926, charged on 63a, Effra Road, and the company's other assets (subject to first mortgage for £3,000 on the said property), the whole amount being now issued.

Willet & Robinson, Ltd.—Mortgage dated May 3rd, 1926, to secure £390 charged on 16, Beaconsfield Road, Tovil, Maidstone. Holders: Trustees of the Loyal Providence Lodge of the Independent Order of Oddfellows (Manchester Unity) number 6,265.

Runbaken Magneto Co., Ltd.—J. Collier, King's House, King Street West, Manchester, ceased to act as receiver or manager on May 4th, 1926.

Nelson Electric Co., Ltd.—G. S. Hyams, Salisbury House, London Wall, E.C., ceased to act as receiver on May 12th, 1926. G. H. Robinson, 95a, Chancery Lane, W.C.2, was appointed receiver on May 12th, under powers contained in debenture dated April 20th, 1926.

Burwood (Concessionaires), Ltd.—G. E. McCanlis, of Oxford House, 9-5, Oxford Street, W.1, was appointed receiver and manager on May 11th, 1926, under powers contained in debenture dated January 15th, 1926.

David J. Patton, Ltd.—Particulars filed on May 5th of £1,500 debentures, authorised March 31st, 1926, charged on the company's property, including uncalled capital, the whole amount being now issued.

Ferrow Electrical Co., Ltd.—Satisfaction in full on January 28th, 1926, of debentures dated December 2nd, 1924, securing £1,000. (Notice filed May 19th.)

Cymbal, Ltd.—Debenture charged on the company's undertaking and property, present and future, including uncalled capital, dated May 4th, 1926, to secure all moneys due or to become due from the company to Barclay's Bank, Ltd.

J. Churly Cann, Ltd.—Particulars filed of £800 debentures, authorised May 1st, 1926, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

Chambers & Champion, Ltd.—Debenture dated May 14th, 1926, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: C. E. Mott, 14, King William Street, E.C.4.

White & Mantle, Ltd. (186,403).—Capital, £1,000 in £1 shares. Return dated December 31st, 1925 (filed March 6th, 1926). 551 shares taken up. £301 paid. £250 considered as paid. Mortgages and charges, nil.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Siemens Bros. and Co., Ltd.

The annual meeting was held on May 31st, Mr. G. Mure Ritchie presiding. The chairman, in proposing the adoption of the report (*vide* our last issue, p. 804), said that the results could be regarded as satisfactory. They could not have been attained without a sound and progressive policy, adequate capital, good plant, efficient management, and friendly co-operation on the part of employés generally, but those advantages by themselves could not have produced such a balance-sheet. Many other companies in different lines of industry possessed all those advantages in equal degree, but nevertheless showed meagre profits or, indeed, losses. That was because they had lacked the one additional thing needful, which, fortunately, the company had had at reasonable prices—an order book large enough to enable the works to be operated practically at full capacity during the year. In so far as they were a sheltered industry, *i.e.*, contractors to H.M. Government, sharing with other contractors a large amount of work for which they competed keenly, they were at least relieved of competition from foreign countries employing cheaper labour and working longer hours, whose home markets were protected, and whose exports were subsidised both directly and indirectly. That limited protection did not, however, apply to their general Home or export trade. Their relations with their employés continued harmonious and friendly. Except for the strike of wireless operators, when about 25 per cent. of theirs ceased work, they were not affected by labour disputes. The policy of the directors in providing extensions of buildings and plant had been amply justified; indeed, but for the provision made, they would have been in danger of being unable to maintain their manufacturing position. The large volume of orders received in 1924 was well maintained during 1925. In 1925 the Pacific Cable Board resolved to duplicate its cable between Vancouver and Fiji, and the company was successful in securing the order for the section to be laid between Fanning Island and Fiji, a distance of over 2,000 nautical miles. This would be the latest type of high-speed loaded cable, the manufacture of which required special machinery which had been installed in part of the new Woolwich extensions. In 1925 they manufactured the latest balanced and loaded type of submarine telephone cables for communication between the north and south islands of New Zealand, and also for the Japanese Government for laying across the Straits of Tsugaru. Further orders were also received for lead-covered submarine telephone cables, one for extending telephone facilities with Bel-

gium and one for communication with France. The volume of business in underground telephone cables was not quite so large as in 1924, but they had obtained orders which kept the shops fairly well occupied. In the case of power and lighting cables, their full manufacturing facilities were needed to cope with the orders received. Substantial contracts for underground cables for overseas were secured against keen competition. During 1925 there was a steady demand for telephone exchanges, both of the manually-operated and automatic types. Their contracts with H.M. Post Office, now in course of execution, included the public exchanges of Wakefield, Hereford, Colwyn Bay, Llandudno, Brighton and Hove, as well as many other smaller exchanges at Home and abroad. Among overseas contracts might be mentioned automatic exchanges for Pernambuco, Stratford (New Zealand), West Winnipeg and Edmonton (Canada), Newmarket and Albion (Australia), and Kloof (South Africa). The work on the "Western" exchange, in connection with the conversion of the London telephone system, was proceeding satisfactorily, and they expected to commence installation of the automatic exchange before the end of 1926. Their telephone shops during 1925 had been considerably extended in anticipation of the development of the public telephone service at Home, but such development was necessarily dependent on the yearly allocation of Government funds, the expenditure of which, however, in that direction, was truly economic, inasmuch as it was not only revenue-earning, but was also vital to the commercial progress of the country. Their wireless marine apparatus business in 1925 again showed an increased turnover, though expansion was still retarded by the depression in the shipbuilding and shipping industries. Their telegraph section was transferred last year to their associated company, Elliott Brothers (London), Ltd., in order to centralise under one management the business carried on by both companies. Though their overseas business was not yet on a satisfactory scale, they had secured notable increases in some directions, chiefly in South Africa and Australia. Dealing with the future prospects, the chairman said that the value of the unfulfilled orders brought into 1926 was larger than that brought into 1925, but a substantial proportion of the business was of a sporadic character and did not recur every year. Their orders received during 1926 were so far smaller in volume than they were for the equivalent period of last year. He saw no reason, however, to apprehend that the profit for 1926 would be lower than that realised for 1925, provided their manufacturing operations continued without further interruption on the present scale. They would, however, realise that profits depended not only on the favourable conditions he had already indicated, but on continuity of manufacturing operations. When their stokers, transport workers, electricians, and engineers—in all only a small fraction of their employés—suddenly stopped work at the beginning of May the works were brought to a standstill, thousands of employés willing to work became idle, and a very serious loss was inflicted on the company. The existing coal dispute, whilst not so far seriously limiting their activities, would, if it continued, do so. The report was adopted.

British Thomson-Houston Co., Ltd.

The annual meeting was held on May 31st. Mr. H. C. Levis (chairman), who presided, expressed his regret at the death, in January last, of Lord Carmichael, who had been a member of the board since 1917. In moving the adoption of the report (*vide* Elec. Rev., May 14th and 21st, p. 773), Mr. Levis said that during the year under review the general trade conditions of the country had been depressed, and competition had continued to be very keen. The value of the orders received during the year was slightly less than in 1924. On the other hand, the amount invoiced to customers was somewhat greater, but, due to competition, the percentage of profit was lower, and, as a result, the profit for the year had been reduced. The expenditure on buildings and equipment during the year amounted to £289,000. It was the policy of the company to develop its manufacturing facilities as rapidly as business warranted; there were few new commitments made during the year under review, and at present the outstanding amount was quite small. After reviewing the accounts, the chairman called attention to the fact that sundry creditors and retentions amounted to £1,332,333, whereas on the other side of the account sundry debtors amounted to £1,907,384; apparatus, supplies, &c., finished and in process of manufacture, to £1,415,544; and cash at bankers to £342,762, giving quick assets amounting to a total of £3,665,609, so that their financial position was strong. The falling-off in orders for heavy plant for use in this country was very marked during the year, but to some extent that was offset by orders from abroad. It was probable that this falling-off was due to the uncertainty created by the Electricity Bill, as well as by the general trade conditions in the country. That situation had continued up to the present, but as it now seemed to be the policy of the Government to pass the Electricity Bill, the uncertainty should disappear and the flow of orders should be resumed, provided there was an early and definite settlement of the coal dispute, and the general business of the country was not interfered with by further industrial troubles. The Government had not exaggerated the possibilities of growth, and it was to be hoped that the outcome of the proposed legislation would be such that the electrical business could advance unhampered, to meet the demand which existed, and a still further demand which could be created. The immediate effect of the strike upon the operation of the company's works was felt but little, and the percentage of employés who were out at any time was very small. The effect upon the placing of new orders was much more serious, and it was to be feared that the strike and the coal situation would continue to have an adverse effect upon prospective orders. On the other hand, it was probable that matters would ultimately so settle down that they would enjoy a period of industrial peace. It was to be hoped that the revival would not be delayed so long that trade conditions during 1926 would fail to reap any benefits therefrom. The report and accounts were adopted.

Westinghouse Electric and Manufacturing Co.

The report for the year ended March 31st last shows gross earnings of $166,006,800 and a net manufacturing profit of $14,294,862. The gross income was $16,590,225, and the net income available for dividends, &c., $14,122,001. To this was added the surplus brought forward, &c., making $65,404,090. Dividends absorbed $9,474,511 and $51,715,396 was carried forward. The report mentions the operations of the Westinghouse Commercial Investment Co., which was formed to increase the distribution of the company's products by supplementing its system of jobbing agents with its own jobbing houses throughout the United States. The investment company declared a dividend of 6 per cent. for the past year. The Westinghouse Electric International Co., which conducts the company's export business, now has branch offices or distributors in 42 countries and has operating agreements with manufacturing companies in England, Holland, France, Germany and other countries.

Rangoon Electric Tramway and Supply Co., Ltd.

During the past year £117,880 of 4½ per cent. debenture stock was redeemed, leaving £103,778 outstanding; the amount of 5 per cent. debenture stock outstanding at December 31st was £300,000. The gross profit for the year was £169,869, plus £1,250 interest, &c., making £171,119. After providing for debenture interest, &c., including transfers of £20,000 to the reserve for cables and £45,000 to renewals account, there was a net profit of £47,983, to which was added £17,599 brought forward, making £65,582. Preference and interim ordinary dividends absorbed £40,582, and after paying a final dividend of one rupee per ordinary share, free of tax (making one rupee 8 annas for the year), a balance of £20,582 is carried forward. The tramway traffic showed an increase during the year and the electricity supply business also expanded. Considerable extensions were made to the distribution system to meet the growing demand, a 3,000-kW turbo-generator was taken over from the contractors, and two 500-kW rotary converters to take the tramway load were installed.

Sir W. G. Armstrong, Whitworth & Co., Ltd.

The report for the past year records a balance of £8,498 at the credit of profit and loss after charging debenture interest, &c., and transferring £900,000 from the general reserve fund. To this is added £656,893, making £665,391. After providing for the interim preference dividend, a balance of £645,391 is to be carried forward. The directors attribute the adverse result to bad trade, heavy production costs, and foreign competition. The company has been unable to obtain business to compensate for the loss of armament orders. Many contracts have shown heavy losses, and it is considered that the greater part of the £900,000 transferred from the reserve will be needed to write these off. The directors have been in consultation with certain of the largest shareholders and the company's bankers, and the present position will be further explained at the annual meeting. The following directors have resigned :—Sir G. H. West, Mr. J. M. Falkner, Sir G. H. Murray, Sir C. L. Otley, and Lord Sydenham.

Aron Electricity Meter, Ltd.

The annual meeting was held on May 27th. Mr. H. Kahn, presiding, said that they had purchased the lease of their old factory building and two adjoining buildings, and the alterations which were being made would equip them with up-to-date factory and office accommodation. The fall in the trading profit was due to the lower profits obtained by the Austrian company, which was caused to a great extent by loss on exchange. Austrian currency was now on a gold basis and the loss should not recur. The outlook for the current year was satisfactory for both the company and the Aron Taximeter Co. Although the Vienna works had had a temporary setback, it was hoped that impending developments would counterbalance that. Altogether the future appeared promising, but the directors intended to pursue their careful policy.

Prospectus.—*Ericsson Telephones, Ltd.*—A prospectus appeared at the beginning of the week inviting subscriptions for an issue at par of 99,980 seven per cent. cumulative preference shares of £1 each in this company, which has heretofore been known as the British L.M. Ericsson Manufacturing Co., Ltd. The issue is being made to provide additional working capital required for handling the largely expanded trade of the company. Record sales figures were experienced for 1924 and 1925, their totals being treble those for 1912, when the last increase in capital was made. Further capital is also necessary to enable the company to commence the manufacture of automatic exchanges and equipment. The ordinary dividend for each of the years 1924 and 1925 was 16 per cent. less income tax. The reserves and undivided profits amount to £227,258, and it is proposed shortly to capitalise part of this sum by applying it in paying up the unissued ordinary shares and issuing the shares so paid up to the existing ordinary shareholders. The list was to close on or before yesterday, June 3rd.

Weston-super-Mare and District Electric Supply Co., Ltd.—The revenue for 1925 was £34,881, and the balance available after deducting expenses, £14,000 for renewals account, &c., and adding £6,356 brought forward, is £18,603. It is proposed to transfer £4,000 to reserve, to pay a dividend of 10 per cent. on the ordinary shares, and to carry forward £6,204.

Electrical Finance and Securities Co., Ltd.—In compliance with the Stock Exchange regulations, this company last week published particulars of its objects, &c. It has an authorised share capital of £100,000 (£76,162 issued) and debenture capital of £20,000 (all issued). The company owns the whole of the capital of the Foots Cray Electricity Supply Co., Ltd., and the Colne Valley Electric Supply Co., Ltd. (which holds a controlling interest in the Northwood Electric Light & Power Co., Ltd.), and the whole of the ordinary shares of the Boston and District Electric Supply Co., Ltd. It has also acquired the share capital of the Lothians Electric Power Co.

Eastern Telegraph Co., Ltd.—The revenue for the year ended December 31st last was £3,473,047, and after deducting expenses there remains a balance of £1,321,125. After providing for taxation, preference stock dividends, debenture interest, &c., and adding £511,317 brought forward, there is an available surplus of £1,555,716, as compared with £1,461,317 for 1924. The directors have placed £500,000 to general reserve and have applied a similar amount from that fund to reduce the expenditure on new cables, renewals, &c. A final dividend of 2½ per cent., free of tax, has been paid (making 10 per cent., tax-free, for the year), and a balance of £555,716 is carried forward. Meeting, June 8th.

Stock Exchange Notices.—The undermentioned securities have been ordered to be officially quoted :—

River Plate Electricity Co.—£35,987 ordinary stock.

Application has been made to the Committee to allow the following to be officially quoted :—

Kaministiquia Power Co.—$1,248,500 seven per cent. cumulative preference stock (in shares of $100) and £200,000 first mortgage 25-year five and a-half per cent. sinking fund debenture stock, series "A."

Marconi's Wireless Telegraph Co., Ltd.—At an extraordinary general meeting on May 31st, an extraordinary resolution for the alteration of the articles of association to provide that the British character of the company should be maintained was carried unanimously. Subject to the confirmation of the resolution as a special resolution at a further extraordinary meeting to be held on June 15th, special forms of transfer, which will be supplied to Stock Exchanges, will be necessary on and after June 16th for the transfer of shares in the company.

Merthyr Electric Traction and Lighting Co., Ltd.—The net revenue for 1925 was £27,337 and the balance on working £4,497, as compared with £11,190 in 1924. To this was added £4,929 brought forward, making £16,119. Debenture interest absorbed £2,178, £2,000 is being put to reserve, and after paying the 5 per cent. preference dividend, a balance of £3,730 is carried forward.

Anchor Cable Co., Ltd.—After the general meeting yesterday, an extraordinary meeting was to be held for the purpose of considering resolutions providing for the capitalisation of £130,000 of the undivided profits and the issue of two fully-paid £10 ordinary shares for each £10 ordinary share at present held. A confirmatory meeting is to be held on June 24th.

Lewes and District Electric Supply Co., Ltd.—The surplus on working for the past year was £9,545, and after charging debenture interest, administrative expenses, &c., there remained £3,550, to which was added £3,444 brought forward, making £6,994. After transferring £1,000 to reserve and paying a dividend of 10 per cent. on the ordinary shares, a balance of £3,667 is carried forward.

Electric Construction Co., Ltd.—The directors recommend a final dividend in respect of the year ended March 31st last at the rate of 9 per cent. on the ordinary shares, making 7½ per cent. for the year, and a bonus of 2½ per cent.

W. T. Henley's Telegraph Works Co., Ltd.—Subject to audit, the directors of the company recommend a final dividend on the ordinary shares of 3s. per share, making 4s. per share for the year, as compared with 4s. for the fifteen months ended March 31st, 1925.

Barcelona Traction, Light and Power Co., Ltd.—A dividend of 1¾ per cent. has been declared upon the 7 per cent. non-cumulative participating preference shares.

Glenfield & Kennedy, Ltd.—A final dividend of 6 per cent. has been declared on the ordinary shares, making 10 per cent. for the year.

Erinoid, Ltd.—An interim dividend of 4 per cent. has been declared.

Stocks and Shares.

MONDAY EVENING.

ALTHOUGH at the time of writing on Monday evening, nothing has been settled definitely in regard to the termination of the miners' lock-out, this is making little difference to the firmness that prevails in most Stock Exchange markets, nor is it having a noticeable effect in any department except those sections which are most intimately connected with the coal industry. It might have been assumed that, having regard to the grave issues involved, electricity supply shares would have declined, but the reverse is the case, and in several shares improvements have taken place during the past few days.

Railway stocks are, of course, inclined to be dull, although, with regard to the electric services, prices are steady, holding their rises of last week. Central London Assented ordinary and Underground Electric Income Bonds are both a point to the good. It is doubtful whether there has ever been, on any previous occasion, an industrial disturbance of magnitude comparable to the present miners' lock-out which has exercised so little influence over Stock Exchange prices. Moreover, business in a good many of the markets, if not exactly brisk, is tolerably well maintained, and it may be said that racing has had more to do with interference of ordinary business this week than the coal crisis.

Rises in electricity supply shares are divided between Bournemouth and Poole, City of London, Metropolitan and Westminsters. Electric Supply Corporations are 1/16 down at 31s. 3d., and North Metropolitan Electric preference eased off to 22s. Midland Counties have recovered to 20s. 6d., the Provincial group as a whole being distinctly firm. Edmundsons regained their previous slight decline.

The market for cable and electrical construction shares is a little quieter after the remarkable strength which it showed last week. All the rises then scored have been retained, and fresh gains of half-a-crown accrued to Henleys and Johnson and Phillips. Henleys have declared a final dividend of 3s. per share, making the dividend 20 per cent., as compared with 16 per cent. in the previous twelve months. As, however, the figures last year covered 15 months, precise comparison with the figures just presented, for twelve months, is liable to be confusing.

Siemens strengthened to 31s. 3d. Callenders hold their rise at £4 per share. The new issue is expected to be made on Thursday in this week. Babcocks keep good at 52s., and General Electrics are 1s. up at 30s. 9d.: the "B" preference at 24s. 6d. have gained a trifle. The buying has slackened to some extent in this section, on the assumption that current prices are fairly well valued, although at the same time it is known that a wide circle of prospective buyers watches closely for any opportunity of picking up stock which looks cheap. Electric Constructions are unchanged at 32s. 6d. upon repetition of the 10 per cent. dividend and bonus, less tax, for the year.

Aron shares are a shade harder at 16s. 3d., as a result of the meeting at which its chairman stated: "I think we may say we are going steadily ahead." It will be well when the company is able to obtain from the Government a satisfactory settlement of the terms upon which the company's income tax ought to be calculated. There is a palpable hardship imposed upon any company that has to keep in hand a considerable sum of money against Government claims which, to the ordinary business man, it would appear obvious should have been settled long ago. The same conditions apply to Siemens, and it seems surprising that the Inland Revenue should be so dilatory over matters of tax collection.

The Eastern Telegraph Company reports an increased profit, the figures for last year being nearly a million and a half. Receipts and expenses both expanded. The allocations are liberal and the company's position is stronger than ever. The dividend is maintained at 10 per cent. free of tax for the year. No change has occurred in the list of Eastern cable stocks. Anglo-American Telegraph preferred strengthened to 102, upon that investment demand which is now so evident in most parts of the House. The American Telephone & Telegraph Company is about to offer next month to its stockholders, new shares at par ($100) in the proportion of one new share for each six shares at present held. The price of the existing stock is 154, so that there is a useful bonus involved in the distribution. This week there have been offered 99,980 7 per cent. cumulative preference shares of £1 each at par in Ericsson Telephones, Ltd.

Brazilian Tractions are at last in three figures again, being quoted at 100. The preferred strengthened to 106. Shawinigan Water has risen 5 points to 188. Montreal Light & Power shares are better at 232½. Anglo-American Tramways Second preference rose to 2¾. Mexican Utilities show a better disposition. In the English group, the excellent British Electric Traction dividend led to a further advance, to 111, in the preference stock: the ordinary holds its last week's gain of 5, at 132½.

Marconis, while nominally unchanged, are a better market at 24s. 6d. The Swedish Telegraph Board has recently concluded a contract with the company in respect of transmission equipment for Sweden's new and extensive broadcasting station. Engineering shares remain firm, although a deplorable report from Armstrong Whitworth was not conducive to cheerfulness in this group. The Armstrong Company transfers £900,000 from general reserve, and even then the profit for last year is but £8,500, compared with £505,000 a year ago, when no assistance was taken from the reserve. The price of the ordinary shares has dropped from 9s. to 6s. 6d. All the preference issues have to go dividendless, as previously announced. Rubber shares lack interest, the price of the raw material being about 1s. 9½d. per lb.

"A New Fuel Industry" is the legend that appears on the prospectus of the Chalk Fuel, Power-Gas and Bye-Products Corporation, Ltd. This concern is the latest of the series in which Sir Charles B. H. Soame and Major Brigden are two of the shining lights on the board. "Fancy burning chalk——!" exclaims one indignant reader: "it were easier to eat coke—to advantage." It is only necessary to add that the prospectus is so bare of the ordinary information which investors should require before parting with their money, that the issue should be left alone by anyone with regard for his capital. The prospectus claims that chalk will burn. So will paper.

An International Congress of Producers and Distributors of Electrical Energy.—This congress is to be held in Rome in September next. The principal subjects to be dealt with include pulverised coal as boiler fuel, the gasification of coal and lignite for electricity production, the employment of steam at high pressures and temperatures in central stations, the position of hydro-electric development in different countries, tele-communication between power plants and distribution stations, &c.

The I.M.E.A. Convention.—We understand that, as far as possible, the programme of the Convention outlined in our issue of April 2nd, p. 545, will be carried out without change at Glasgow, though under the circumstances slight departures from it may be unavoidable.

The exhibition of electrical appliances and novelties will be held at the McLellan Galleries, Sauchiehall Street, a space of about 10,000 sq. ft. being available; twenty-four manufacturers will be represented, besides the Electricity Department of the Corporation and the E.L.M.A. Lighting Service Bureau. The British Electrical Development Association and the Electrical Association for Women will also take part in it. The exhibits will cover not only, as usual, cooking, heating and lighting apparatus, but also a much wider range of appliances of interest to engineers, such as heat storage apparatus, industrial heating appliances, thermostats, meters, new wiring methods, &c. The exhibition will be open from 10 a.m. to 9 p.m. every day during the week; on Monday only members of the Convention will be admitted, but on other days certain hours will be allotted to the general public.

Exports and Imports of Electrical Goods and Machinery in April, 1926.

IT is unfortunate at a time when we need every encouragement to make up for the time lost last month, to say nothing of the effects of the coal dispute, the origin of it all, that our statistics of foreign electrical trade during April make such a bad showing, both against the March figures and those of April, 1925. The position cannot be attributed to the incidence of the Easter holidays, for Easter occurred in April last year, and yet our export total is over £400,000 smaller than in April, 1925. It may be that there was a slowing-down in anticipation of the industrial troubles, which were fully realised last month, but whatever the reason the fact remains that our exports declined for the third time this year.

The fall of over £280,000 in the total value of exported electrical goods followed a decline of £99,275 in March, although in the latter case the figure was above that for the equivalent month of last year, whereas April's total shows a serious falling-off from the 1925 total. The decline was spread over practically all classes, the only exceptions being "other motors and generators," switchboards (not telegraph or telephone), and telegraph and telephone instruments and apparatus. The most serious fall occurred in the exports of insulated wires and cables which lost over a third of their March value. This was accompanied by large decreases in the other two cable sections—submarine and non-submarine telegraph and telephone cables. Unenumerated electrical machinery and traction motors were affected heavily, and unenumerated electrical goods and apparatus was another item which "slumped." The other decreases were of comparatively small importance. As a result of the large fall in electrical exports during April, the total for the first four months of the year is about £560,000 behind the figure for the equivalent period of 1925. The May total is, naturally, certain to be smaller, but there still remain seven months in which the exports have time to recuperate. We may observe as an extenuating circumstance that April, 1925, was a very good month indeed, in which exports rose by over a quarter of a million above the comparative totals.

Turning to the import section it will be seen that although there was a net decline of £4,100 as compared with March, the increases and decreases were fairly evenly balanced. The largest alteration was a rise of £18,000 in the imports of unenumerated electrical goods and apparatus, which, by the way, accompanied a large fall in exports of the same class. Insulated wires and cables showed the greatest decrease (about £15,000); none of the other items showed large alterations in value. As compared with the April, 1925, figures there was a large decrease in imports, but this was mainly due to the fall in the value of imported telegraph and telephone instruments and apparatus. On the other hand, the figures for batteries and accumulators and unenumerated electrical machinery were well up as compared with those for April, 1925. Imports for the four months also show a substantial decrease in comparison with the corresponding period of last year.

The comparatively unimportant re-export section also has decreases to record both in comparison with the preceding month and with April last year. As compared with March the decrease was fairly general, there being only two small increases. This section again shows a diminution for the first four months of the year as against January-April, 1925.

United States Electrical Exports.—The value of electrical goods exported from the United States during March reached a high level, totalling $8,586,252. Comparing the statistics with those for March, 1925, it is seen that there was a large decrease in the value of exported generators (except small lighting sets) and the exports of mining and industrial locomotives also declined. On the other hand, the exports of railway motors showed a very large increase, as did also transformers, converters and transmission and distribution apparatus. With the exception of the fractional-h.p. types all classes of motors recorded increases, particularly those from 1 to 200 h.p., which were nearly doubled in value. Domestic apparatus exports were larger and radio goods, including batteries, increased by $286,000.

Manufacturing in Belgium.—The report of the Société d'Electricité et de Mécanique (Procédés Thomson-Houston et Carels) states that although the industrial reorganisation of the undertaking was methodically continued in 1925 and the volume of orders received was considerably larger than in the preceding year, the accounts only show profits of 2,804,000 fr., which just cover the financial charges and permit of some necessary provision for depreciation. The company's inability to derive full benefit from the progress made in its various branches is said to be due to a labour dispute which lasted from July 2nd to the beginning of September. The result was that it was impossible to complete and invoice important orders which ought to have been brought into account last year. It is stated that the increase in the orders received was due to the continued development of the export trade.

The Frequency Characteristics of Telephone Systems.

The Apparatus and Methods used for Testing.

By B. S. COHEN, A.M.I.E.E., A. J. ALDRIDGE, A.M.I.E.E., and W. WEST, B.A.

(*Abstract of paper read before the* Institution of Electrical Engineers.)

The paper demonstrates the value of the frequency-amplitude characteristics of telephone systems and apparatus in determining the transmission efficiency, including volume and articulation efficiency. The audio-frequency ranges of importance for speech and music are considered and methods are described for the direct and indirect production of constant acoustic output over the audio range, and the calibration of acoustic measuring instruments is dealt with. Next, the production of electrical energy of constant value over the required frequency range is treated of and a special form of oscillator, together with associated apparatus for the direct recording of frequency characteristics, is outlined.

A thermionic oscillator can be arranged to cover all the requirements, and during preliminary work the use of two ultra-audio oscillators heterodyning with one another appeared to be the method which could be usefully applied to the present problem. If an oscillator working at a frequency of, say, 25,000 cycles per sec. is coupled loosely with another which is caused to oscillate at any point between 25,000 and 30,000 cycles, the fundamental of each oscillator will be inaudible, but a "beat" frequency will be introduced varying between 0 and 5,000 cycles. No difficulty is experienced in obtaining the "beat" frequency, but considerable difficulties are encountered in rendering it sinusoidal in shape and constant in value, and it is essential to secure these qualities if the maximum use and convenience are to be obtained from the instrument.

At frequencies of 25,000 cycles a change of frequency of 5,000 cycles can be effected by changing the oscillator capacity by a small amount, which can be covered in a 180 deg. movement of a small air condenser. This means that the whole range of audio frequencies normally required (say 0 to 5,000 cycles) can be obtained by the rotation through 180 deg. of a single dial. The range can, of course, be altered by modifying the ultra-audio oscillators, or the small variable condenser.

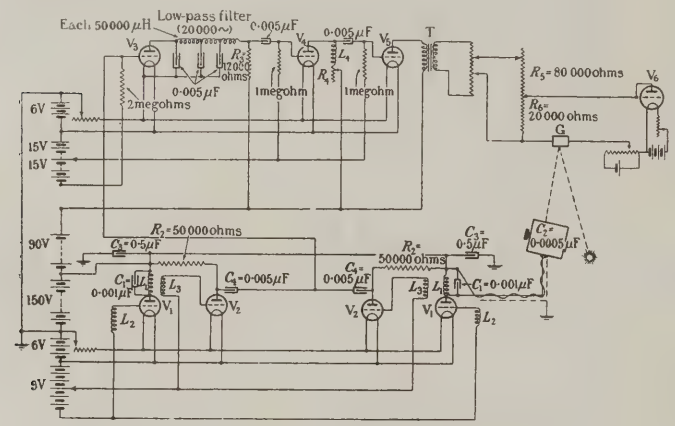

Fig. 1.—Complete Heterodyne Oscillator.

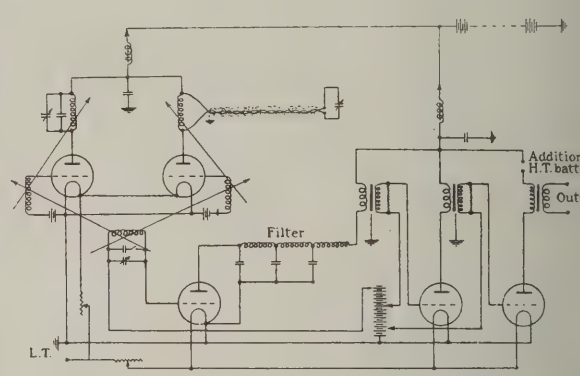

Fig. 2.—Portable Heterodyne Oscillator.

The general method of operation is to cause the oscillator to actuate the apparatus under investigation, the result of this actuation being measured as a galvanometer deflection recorded photographically on paper on a drum which is rotated with the variable air condenser used to obtain the variation in frequency. This method of operation required the use of receivers or transmitters having equal outputs over the range of frequencies under consideration. For example, in examining a transmitter for resonance it would be actuated by a special non-resonant receiver operated from the oscillator, and the a.c. output would be rectified and passed through a d.c. galvanometer, the deflections of which would be recorded, as described above. A receiver would be tested by operating it from the oscillator, and causing it to actuate a non-resonant transmitter. Non-acoustic apparatus, such as transformers, induction coils, &c., are examined by current or voltage measurements.

In designing the apparatus at present in use the following requirements have been covered:—(1) The range of audio frequencies covered by the rotation of the dial of the operating variable condenser through 180 deg. is from 0 to 5,000 cycles. (2) The output at all frequencies within the range is practically sinusoidal. (3) The output voltage is practically constant for all frequencies within the range. (4) The high frequencies of the oscillators are eliminated before reaching the audio-frequency output, in order to prevent interference with current measurements on the galvanometer.

The circuit diagram of the heterodyne oscillator used by the authors is shown in fig. 1, which illustrates also the method employed for taking photographic records. Each high-frequency oscillator circuit comprises a grid coil L_2 of 50,000 μH, coupled to a plate coil L_1 of 20,000 μH, tuned by a fixed condenser C_1 (about 0.001 μF). A variable condenser C_2 with a maximum value of 0.0005 μF is connected in parallel with one of the condensers C_1, to cover a frequency range of about 5,000 cycles. Output coils L_3 of 10,000 μH introduce the high frequencies from each oscillator into the high-frequency amplifying valves V_2, which serve to prevent, as far as possible, interaction between the two oscillators; each oscillator, with its associated high-frequency amplifier, is also enclosed in an iron box. The high frequencies are taken by resistance-capacity coupling and a common input lead to the grid of the detector valve V_3, which operates on the anode rectification principle. In the plate circuit of this valve is a low-pass filter having a cut-off at about 20,000 cycles, serving to reduce to a negligible quantity the high frequencies in the audio-frequency output; moveover, it provides (for the high frequencies) a sufficiently low-impedance path from the plate to the filament to ensure efficient operation of the detector valve. Two stages of resistance-capacity coupling bring the audio-frequencies to the output transformer of the set.

With an ordinary-type output transformer, the output/frequency characteristic was found to be unsatisfactory, the output increasing too slowly as the frequency was raised from zero, and falling off again at the higher frequencies. Output transformers for the heterodyne oscillator are accordingly built on 1-in. square cores of Stalloy stampings, the windings consisting of a number of interleaved wave-wound slab coils. It is, of course, essential that the secondary winding should terminate with a non-reactive load, a generally useful value for which is 800 ohms, through which a current of about 10 mA is obtainable. When more current is required this load may be increased to, say, 100 ohms, and the transformer ratio and resistance of the secondary winding may conveniently be adjusted by joining in parallel certain of the slab coils.

Whilst such a transformer gives a satisfactory output at the low frequencies, there is a tendency for the output to fall off at the higher frequencies. In order, therefore, to flatten out the characteristic, the output at the lower frequencies is cut down to the same value as that obtainable at the high frequencies. To effect this, a 0.2 henry air-cored inductance L_4 was inserted in the anode circuit of the first audio amplifying valve in series with a variable non-inductive resistance R_4, the impedance of this circuit thus having a rising characteristic with frequency.

The method of measurement is illustrated in fig. 1. A rectifying valve V_4 has in circuit a quick-moving reflecting galvanometer G, the spot of light from which falls on photographic paper wound round the drum of the condenser camera C_2 (V_4 is shown as a diode rectifier; as a general rule, however, it is preferred to use a triode with anode rectification.)

For many purposes it is convenient to substitute for the condenser camera a pair of variable condensers in parallel, one of, say, one-half the capacity of the other, and one equipped with a vernier that can be adjusted so that the beat frequency is zero when both condensers are set at zero. One condenser will then give half the available frequency range of the oscillator for a 180 deg. rotation of its dial, whilst the whole frequency range is obtainable from the other condenser; the dials of both condensers may be engraved in frequencies.

The wave-form impurity is almost entirely due to a second harmonic, as was tested by tuning out first the fundamental and then the second harmonic. From a measurement (with the impure wave-form) of the capacity of a condenser, the impurity did not exceed 5 per cent. of the fundamental.

A variable condenser (about 0.001 μF maximum) shunted across the input to the detector valve is a useful addition to the heterodyne oscillator, for as the value of this capacity is increased, so the output from the oscillator is reduced and, at the same time, the wave-form is improved. Hence, when-

ever the maximum output from the oscillator is not required, a suitable adjustment of this capacity is made in order to obtain the best wave-form available. The operation of the condenser in this respect is two-fold, by reducing the magnitudes of the alternating voltages in the audio-frequency amplifier it lessens the percentage of harmonics generated therein, and by providing, in the plate circuits of the high-frequency amplifying valves, an impedance, which is lower for the harmonics than for the fundamental, it tends to purify the wave-form of the high frequencies introduced into the detector valve.

The general method preferred for making frequency characteristic tests with the heterodyne oscillator is to introduce a constant voltage from the oscillator across a non-reactive resistance, which forms a part of the normal input connections to the apparatus under test, and to record the voltage output, with the circuit terminated by an impedance equivalent to that used under working conditions. This method involves the use of a suitable non-reactive attenuator run between the output transformer of the oscillator and the apparatus under test, serving to maintain a non-reactive load on the transformer and also to retain the normal impedance, on the input side of the apparatus under test, uninfluenced by the presence of the transformer.

A smaller and more portable pattern of heterodyne oscillator has also been constructed. The arrangement is somewhat different from that of the large instrument, and the circuit is shown in fig. 2. It will be observed that no high-frequency amplifier stages are used in conjunction with the oscillators.

The concluding part of the paper contains the frequency characteristics of each part of the apparatus used in a telephone connection, and also of audio-frequency amplifiers and loud-speakers. For the purely electrical portions of the circuit, current or voltage characteristics are added, whilst for such apparatus as transmitters and receivers the characteristics are given in terms of acoustic pressures on the diaphragm. The characteristics of some commercial types of granular transmitters are outlined, then under the heading of receivers will be found the characteristics of both the Bell pattern and some typical loud-speakers of the horn and hornless types. Particulars are given of apparatus designed to measure diaphragm motion, some results obtained by an aural balancing method being included.

In the section dealing with lines will be found characteristics of unloaded open wires and cables and loaded cables. An impedance/frequency characteristic is also given and its application to fault location illustrated. Some notes on telephone line repeater characteristics are followed by a section dealing with exchange cord circuits and subscriber's instrument characteristics. Under audio-frequency amplifiers some typical inter-valve transformers of the type used for broadcast reception are characterised, and an extension is given of the theory of this type of transformer covering the effects of resistance and capacity loads.

Finally, it will be obvious that it is impossible to deal adequately in one paper with the frequency characteristics of all apparatus used for the transmission of speech and music, and little attempt has been made to do more than indicate the results obtained with typical apparatus of each of the various classes. The few characteristics given indicate the highly resonant output of commercial telephone receivers and transmitters and the extent to which the volume efficiency must depend upon resonance. The characteristics show that there is considerable room for improvement in the case of receivers and transmitters, and it is claimed that the apparatus described in the paper forms a ready means of enabling the effects of change in construction and design to be conveniently observed, measured, and recorded.

Discussion in London.

During the discussion that followed the reading of an abstract of the paper by Mr. B. S. Cohen, it was pointed out that the paper differed markedly from that which the authors had previously presented. Telephone devices must be operative over a band of frequencies, and accordingly any single-frequency method of testing them was of no use by itself. The paper marked the advance which had been made in five years by the Post Office research staff, who not only knew what was being done, but also carried out original research. The authors made no reference to the "transmission unit."

The great strides made by weak-current engineers was due to the development of the thermionic valve; at the City and Guilds Engineering College attempts had been made to obtain similar results to those claimed by the authors by means of an oscillator very like that shown in fig. 1, but without much success. Whilst the values of various coils, condensers, resistances, and voltages had been carefully indicated in the diagram, the valves used were simply designated v_1, v_2, &c., and the authors had not explained how they had managed to obtain their results, nor how they were able to use a common high-voltage battery. Scientifically accurate pictures needed to be very carefully interpreted acoustically, for the ear very quickly became saturated; for broadcast radio-telephony the full picture was required, for ordinary telephony an outline sufficed, whilst telegraphy conveyed a cubist impression which needed expert interpretation.

The employment of a heterodyne oscillator was a question of the degree of accuracy and constancy permissible, as distortion was introduced by the position of the listener's head. The Western Electric Co., in America, had carried out similar experiments and obtained like results. A gramophone and records, in the construction of which telephone principles had been applied, were exhibited; the machine and records could be calibrated and, therefore, the total output of the machine was known. As a producer of ascertained sound intensity its demonstrator claimed such a machine to be a better proposition than the so-called simple oscillator with its several valves, batteries, &c.

Much research had been carried out, and it was hoped that more of it would be translated into practical results, *i.e.*, better telephone lines and instruments. Many questions were put to the authors, and in reply to some of them Mr. A. J. Aldridge remarked that no real difficulty had been experienced in using the oscillator shown in fig. 1, but the Post Office authorities had no intention of placing an instrument of that kind on the market.

Insulating Compound Tests.

New Belgian Regulations for Cable Box Insulation.

The Comité Electrotechnique Belge has recently issued a new series of conditions for tests of insulating compound intended for the filling of electricity supply cable boxes. A distinction is made between the material, M.O.B., used in boxes located in positions subject to normal temperatures, and M.E.C.B. for use where high temperatures are met with. The temperature at which the material flows must not be lower than 40 deg. C. for M.O.B. and 60 deg. C. for M.E.C.B., when tested by the Kraemer-Sarnow method, which determines the temperature at which 5 grammes of mercury pass through a 5-mm. layer of insulating material contained in a glass test tube of the same diameter.

The apparatus is prepared by cutting a glass tube of a certain length and of a diameter of 5 mm. Inside the tube is placed a glass disk arranged to slide exactly within it, and wetted so that the test piece of material shall not adhere to it. After pouring the compound into the tube, when everything is cold the glass disk is removed, and the 5 grammes of mercury

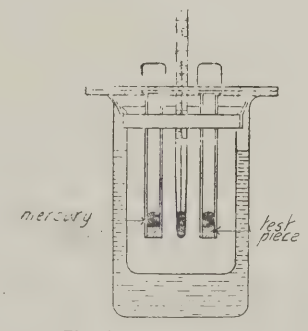

Fig. 1.—Temperature Test.

inserted on the top of the test piece. The tube is then fixed in a test bowl placed in a heated bath, fig. 1. The temperature at which the mercury passes through the insulating material is recorded by the adjacent thermometer.

At 20 deg. C. the insulating material is required to be non-breakable, although capable of being scraped by the finger nail, and when melted at 100 deg. C. it should be perfectly homogeneous and quite free from lumps.

The material must also be capable of adhering to metal, and to ensure that it possesses this property it is tested by flowing it, when melted at 100 deg. C., on to a 0.3-mm. sheet of tin set in a rectangular frame, 130 by 180 mm., made of 3-mm. sheet metal. The layer of compound is levelled off and allowed to cool to 15 deg. C. Then with the material on the upper side, the tin sheet should be capable of being bent in all directions, without the material becoming detached from the tin, although splits or cracks in the surface are permissible.

The minimum dielectric rigidity is laid down to be 25,000 volts effective per mm., the voltage curve to be practically sinusoidal and the frequency 50 periods per sec. The dielectric rigidity test is made by flowing on a flat circular horizontal plate, heated to a temperature of about 100 deg. C., a layer of the melted material at least 250 mm. in diameter and from 1 to 1.5 mm. in thickness. The plate and layer are then put aside until the former is quite cold and the material thoroughly hardened. The testing appliance consists of a lower electrode of at least 250 mm. diameter, and an upper electrode, of the shape shown in fig. 2, weighing 1 kg. and having a surface contact with the material of 25 sq. cm., and an outside diameter of 110 mm. By measuring the thickness of the test disk at a distance of 5 or 6 mm. from the pierced crater, it is possible to deduce, by a simple proportional calculation, the rigidity per mm. in terms of breakdown pressure.

The contraction of the material at temperatures from 150 deg. C. to 15 deg. C. should not, during test, exceed 7.5 per cent. This test requires a graduated metallic recipient in which a sample of the material is first heated to 150 deg. C. and then allowed to cool to 15 deg. C. Oil is then added to the 150 deg. C. level, so that the degree of contraction can readily be determined. There should be no sign of bubbles when the material is kept heated up to 200 deg. C. for five hours. Finally, the tests for acidity and alkalinity provide that the compound when placed in boiling water should impart

neither alkalinity nor acidity to the liquid, nor at temperatures below 150 deg. C. should it have any attacking effect on metal, while when dissolved in sulphide of carbon the material should not leave a residue of more than 2 per cent.

In using insulating material in cable boxes, the Comité points out that the flow of the material should only take place after the boxes have been thoroughly cleaned. When filling the boxes the material should be at about 125 deg. C. in order that it should neither burn the insulators nor solidify before it has penetrated into every part, so that the formation of air

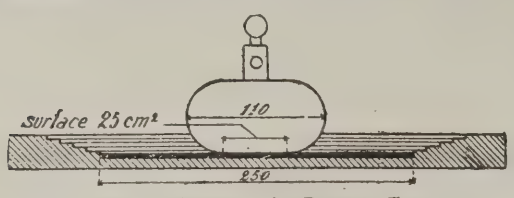

Fig. 2.—Apparatus for Puncture Test.

pockets is prevented. The material should be poured slowly, a little at a time, until the box is filled. Insulating material which has been kept heated a long time is unsuitable for successful use.

Our Mr. Smith.

By a Tenderfoot.

Out of the cold, drizzling rain and the gloom of a small manufacturing town, into the comparative warmth and light of the hotel, comes a tired, travel-stained person carrying a bag. The bag is small, but tightly packed drawings, photos and catalogues, plus a slide rule and a few other essentials, seem to increase in weight during the day and finally turn the scale at about .25 lb. per cubic inch. Probably the weight varies according to some such formula as $W = w + wkt$, where w is the weight at the beginning of the day, k a constant depending on the weather and the state of trade, and t the time in hours which has elapsed since the last meal.

The figure with the bag collects an envelope, and finds inside a copy of a letter sent from his head office to a prospective customer—sorry, client—in a particularly obnoxious town 80 miles away on a branch line. The letter reads :—

"We thank you for your letter of the 2nd inst. Our Mr. Smith is in your district, and we have asked him to call on you at the time you suggest, to discuss our quotation of the 23rd ulto."

At the bottom is a penned note, "10.30 Friday morning. Hope you can manage—we must get in with these people."

Mr. Smith, for the transporter of the bag is none other, murmurs a little prayer, chalks up 6.30 on the call board, and departs to extract food after "service hours" out of an unwilling kitchen staff.

The morning fulfils the promise of the previous night; rain in parts, further outlook unsettled. Mr. Smith, his brain cleared by a little blood-letting—why are hotel bedrooms built so that a shaving mirror can never be suspended in a favourable position?—reflects that he has to be 80 miles away by 10.30, and in the afternoon is due to investigate some trouble on plant installed some miles from a station on another branch line.

The breakfast is not good. Doubtless the cook is a slow starter, and serves up delicious bacon after a few trial runs, but Mr. Smith always seems to be down in time for a trial run.

We will not follow our friend's fortunes through the day. The branch line was typically branch, the prospective client disappointing, the plant trouble something which any ordinary engineer would have cured without worrying the makers. Lunch, taken late, was a respite from rain, but as a meal left much to be desired.

After a long (time, not distance) and foodless journey, our Mr. Smith seeks a haven for the night. Tucked in his little bed, in a room near the lift and overlooking the tram terminus, he reviews the happenings of the day; he has not "got in" with the prospective client; the trouble which he cured was due to unskilled handling of the plant, and he will not receive any plaudits from a delighted works for saving the visit of a proper trouble-man; he has left his slide-rule somewhere around the engine room, and if not broken by now it will certainly be damaged in the post; he must have a hair-cut to-morrow, but doesn't quite see how or when.

A few hours later, at the works, a worried manager is scanning an attenuated list of orders and cursing the sales staff, ignoring the effect of trade depression, competition, seasonal slackness and other factors. At a desk in a neighbouring office an engineer gazes out of the window at a blue sky and wishes he had an outside job, instead of being chained to a desk in an unbeautiful works.

At about the same time our Mr. Smith is sitting at a wayside junction watching the back of his train vanish into the distance and murmuring, perhaps, "Now more than ever seems it meet to die, to cease upon the midnight with no pain." A thin rain is falling and there is no refreshment buffet.

There is a moral for us all in this, somewhere.

The Electrical Imports of Egypt.

The following statement, showing the imports of electrical and similar goods into Egypt during the year 1925 is taken from the recently-issued trade statistics. The figures for 1924 are added for purposes of comparison, and notes of any increases or decreases are given :—

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

A New Rectifier.

A rectifier has been put on the market by MESSRS. PHILIPS LAMPS, LTD., of 145, Charing Cross Road, London, W.C.2, for charging motor-car batteries of up to 6 V at 6 A, or up to 12 V at 3 A, from alternating-current circuits of various voltages up to 260 V. It consists of a transformer, a rectifying valve, and two current-regulating lamps, mounted on a base 8 × 6 in., in a neat case standing 14 in. high. The apparatus weighs 24¼ lb. It is provided with a plug

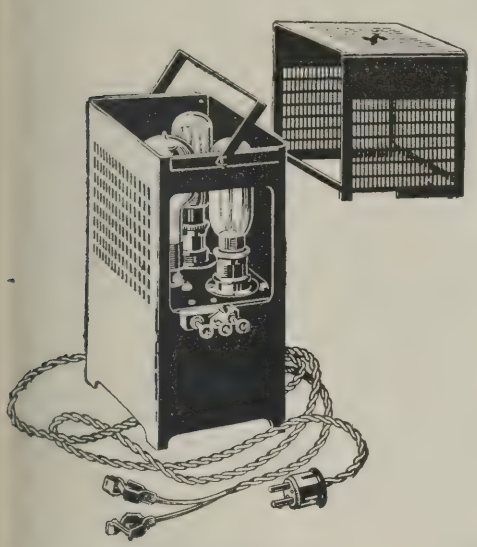

Fig. 1.—The Philips Rectifier.

Fig. 2.—A New h.p. Cable-handling Pole.

for connection to the lighting circuit, and terminals for connection to the battery. When charging at 6 amperes, both waves are utilised, but for 3 amperes it operates as a single-wave rectifier; in the former case it takes about 150 W; in the latter case, at 10-14 V, 125 W, and at 2-8 V, about 90 W. On no-load it takes 20 W. The current remains constant, independently of the number of cells charged, and no ammeter is necessary; the charging terminals can be short-circuited without any ill effects, and the rectifier is silent in operation.

A similar rectifier, using both a.c. waves, is made to charge from 1 to 6 cells at a constant current of 1.3 A, and is very suitable for charging accumulators for radio sets; we have used one for some months for this purpose, and have found it in every way satisfactory. This set is contained in a neat perforated aluminium case.

The rectifiers work on all frequencies from 40 to 100 cycles, and on any voltage specified; the life of the valve and lamp is stated to average 1,000 hours. The appearance of the device is shown in the accompanying illustration (fig. 1).

An Electric Iron with Damping Device.

A new development in electrical apparatus for domestic ironing operations is represented by the introduction of the "Eldec" electric steaming iron, described in *Electrical Merchandising*, by the ELDEC CO., INC., 501, Fifth Avenue, New York, which applies moisture to the material during the ironing operation. The "Eldec," a 6-lb. iron, fig. 3, is fitted with a water reservoir, contained in its insulated handle, with conduit leading to the bottom plate. The water, regulated by a

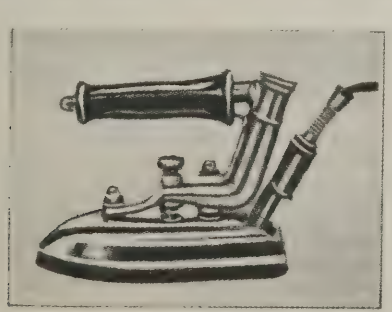

Fig. 3.—A Damping Electric Iron.

small turn-screw valve, passes drop by drop into the heated plate, and issues as steam through a series of tiny holes, forming a mist-like film on the fabric being ironed. The iron is designed for 106/115 V. It is nickel finished.

A New H.P. Cable-Handling Pole.

With the object of indicating the electrical state of the apparatus being dealt with, the Etablissements Merlin and Gerin, of Grenoble, France, have recently introduced an improved form of insulated cable-handling pole for the accompanying sectional drawing of which we are indebted to *L'Electricien*. The device (fig. 2) consists of a narrow tube C of bakelite, which, when protected from wet and damp, has a very high dielectric rigidity. As an additional protection against damp, the lower portion of the pole, from A to B, is filled with a melted insulating compound. The upper end of the pole terminates in a double hook used for the manœuvring of the cables, the hook being secured in position by a concentric device. The novel feature of the pole consists in mounting within it, between the hook and the plug A, a glass bulb which is visible through a slot in the pole. The bulb is filled with low-pressure neon, a gas which has the property of self-illumination when placed in an electrostatic field. The bulb is held in place by a felt packing and upper and lower springs R1 and R2. The two extremities of the bulb are connected through the springs with the double hook and with a metallic ferrule V.

When the hook is in contact with a live cable the electric field causes the neon to show a red light at voltages of 5,000 and over. The luminosity increases with the pressure and for voltages of 20,000 and over the bulb will show a light when brought near to but without touching the cable. It is claimed that by using a suitable length of bakelite tubing the pole can be safely employed for voltages up to 70,000. For the high pressures the neon tube is located at a lower point in the pole and is not connected with the hook.

In addition to manœuvring live cables into position the new pole can be utilised to test whether the two ends of an open sectioniser are of the same potential and phase. By placing the hook on one conductor and bringing the metallic ferrule into contact with the other, the luminosity in the neon bulb will disappear if the two conductors are of the same pressure and phase. The luminosity will, however, continue if only one of the conductors is live or if both are live but are not in phase. In using the pole for this purpose luminosity appears in the bulb at 2,000 V, due to the fact that not only is there an electric field, but a flow of current in the tube. In using the device for the testing of two conductors, the safe pressure limit so far as tests have been made is from 30,000 to 35,000 V.

Low-Speed Worm-Geared Motors.

MESSRS. MARRYAT & PLACE, 28, Hatton Garden, London, E.C.1, have recently added to their range of worm-geared

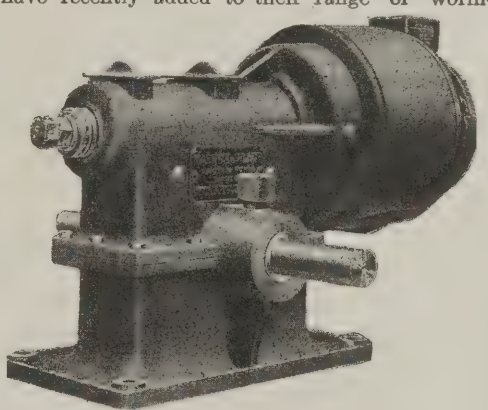

Fig. 4.—A New Fractional-h.p. Worm-geared Motor.

motors, machines covering from ⅛ to ¾ h.p., with shaft speeds of from 20 to 80 r.p.m. Fig 4 shows one of these machines. It is fitted with ball-thrust bearings, gun-metal bushed main bearings, gun-metal worm wheel and a castor-oil bath. The motors are continuously rated.

A Self-contained Outdoor Sub-station.

With a view to reducing the distribution costs in connection with the construction of brick and concrete transformer chambers and sub-stations, the FOSTER ENGINEERING CO., LTD., Morden Works, Wimbledon, London, S.W.19, has produced a self-contained outdoor sub-station, marketed in sizes up to 200-kVA capacity, and constructed for single-, two-, or three-phase, or for "Scott" connected three/two-phase transformation. The device is particularly suitable for use in connection with supplies to rural areas and isolated consumers. The transformer is housed in only one enclosure, thereby reducing heating losses. A specially designed chamber is fixed on top of the transformer containing the h.p. and l.p. control fuses, &c., including a tapping switch (connected to either the h.p. or l.p. side) and a substantially designed voltmeter and ammeter by which the load and pressure can be measured at any time. The standard control equipment also includes a plug connector, an isolating link and a tetrachloride on each phase, and an earthing link, mounted on a h.p. panel. A l.p. panel

is equipped with four fuses per phase, a bus bar for the return leads, and the necessary terminals for the incoming cables. The switch chamber has doors on opposite sides, one giving access to the h.p. panel and the other to the l.p. control gear. The combination of the transformer and switch chambers makes a pillar unit to which is added a cable column leading from the ground to the upper compartment. Fitted at the top of the column is a sealing chamber provided with armour clamps. Sockets are provided to accommodate the plug connectors on the h.p. side, and provision is made for the l.p. cable ends to be brought to the appropriate terminals. The transformer is of the oil-cooled type mounted in a strong steel tank of special construction, provided with rollers, which is fitted with cooling tubes for outputs of over 25 kVA. As it is desirable to keep the exposed fittings down to a minimum, the oil drain cock is arranged underneath the tank, and the oil gauge takes the form of a float with an indicating rod, the latter being inside the switch chamber.

In the case of a breakdown or other emergency it is intended that the whole sub-station be removed and another put in its place, making the operation much less formidable than removing a transformer out of a kiosk or chamber. The overall dimensions for a 3-phase, 100-kVA unit, are 72 in. high, 49 in. long and 32 in. wide.

Electrical Progress at Shanghai.

Annual Report of the Electricity Undertaking.

WE have received from Mr. T. H. U. Aldridge, M.I.E.E., engineer-in-chief and manager of the Shanghai electricity undertaking, a copy of the report of that concern for the year 1925. For the first time since its inception in 1901 the undertaking has suffered a drop in its output, the kWh sold during the year being 294,343,905, as compared with 307,307,401 for the previous year, a reduction of 4.22 per cent. This was due, of course, to the great strike. In spite of the diminished sales, the year's trading yielded a net profit of £212,953, against £219,624. In view of the reductions made in charges for lighting and heating during the year, 15.38 per cent. and 14.28 per cent. respectively, the result is particularly satisfactory. The estimated net profit for the present year, 1926, is £276,967. Of the profits for 1925 £180,000 has been contributed to the general municipal funds.

The plant capacity of the Riverside Power Station, including a 20,000-kW turbine then in the course of erection, was at December 31st last 121,000 kW The maximum peak load on the station during the year was 77,000 kW, and the maximum sustained load for thirty minutes was 76,600 kW, against 66,200 kW for 1924; the maximum load delivered to the feeders was 72,930 kW, an increase of 14.92 per cent. on the 1924 figure, as compared with 0.88 per cent. increase in that year on the 1923 figure. Since the close of the year under review the maximum sustained load has risen to 80,000 kW. The load factor for 1925 was 53.06 per cent.; this factor was calculated on the kWh generated to bring the result into line with the figures for the municipal undertakings in Great Britain. The number of consumers being supplied at the end of the year was 38,932, an increase of 2,413, representing 12,173 kW. The thermal efficiency of the station was increased from 16.2 per cent. to 17.43 per cent. The B.th.u.'s consumed per kWh generated have been reduced from 21,047 to 19,593.

The overall boiler efficiency was 77 per cent., but in the boiler house equipped with the larger boilers and operating under better conditions than the other two houses, the average efficiency was 79 per cent. Two of the larger boilers are being equipped with Howden-Ljungstrom air preheaters, which it is anticipated will increase their efficiency to 85 per cent.

The total length of underground cable in the distribution system at December 31st was 348 miles, of which 120 miles was 22,000-V cable. 4,265 miles of overhead cable was in existence. The total capacity of transformers in sub-stations, including induction regulators, was 266,278 kVA. The total c.p. of public lamps at the end of the year was 476,700, representing an increase of 25,000 c.p. A total of 116,650 h.p. of motors was connected to the mains, an increase of 6,857 h.p., during the year. The heating and cooking load added to the system during the year was 4,282 kW, bringing the total up to 13,450 kW. The rate covering these services was 1.08d. per kWh. The power rates varied from 1.08d. to 1.62d., and the lighting flat rate was 3.96d. per kWh. Special bulk supply rates are in some cases as low as 0.6d. per kWh, which is made up of an annual capital and fixed charge per kW demanded plus a running charge per kWh consumed, the latter being subject to adjustment each half year in accordance with the cost and calorific value of the fuel consumed.

In view of renewed business activity in Shanghai, the first instalment of a 50,000-kW extension is now in hand. This will consist of the 20,000-kW turbo-generator referred to and three boilers, each to evaporate 150,000 lb. of water per hour. A second turbo-generator and a fourth boiler of the same respective sizes are, it is hoped, to be ordered next year. Referring to the two new turbo-generators, Mr. Aldridge says that, as these machines will produce a considerable percentage of the total output, the economies of adopting higher steam pressures and superheat far outweigh any slight inconvenience which might be apparent by having two steam pressures in the same station. It is interesting to note that it is not expected to have to raise new money for the additional plant.

Notes from Canada.

(From Our Special Correspondent.)

FOLLOWING the death of Sir Adam Beck there was not for some time much to record regarding the doings of the Hydro-Electric Power Commission of Ontario. No doubt there would have been somewhat of a lull in any case until the new chairman had had time to take in the situation and get his bearings, but it seems as though the past few months must have been filled with work behind the scenes which has just begun to bear fruit. Owing to the rapid rate of growth of the loads on the Commission's systems, the one urgent need was to find sources of power additional to those at present available. There were several possibilities:—(*a*) Additional diversion of water from the Niagara river; (*b*) Development of power on the Ottawa River; (*c*) Development of power on the St. Lawrence River; and (*d*) The building of one or more large steam generating stations at suitable points.

With regard to (*a*) Canada desires to have a full settlement of the Chicago diversion question before any change is made in the International Boundary Waters Treaty which specifies how much water may be diverted from the Niagara river by Canada and the United States, the figures being 36,000 and 20,000 cubic feet per second respectively. Chicago, in the language of her opponents, is "stealing" something like 10,000 cubic feet per second from the Great Lakes system by taking water from Lake Michigan through the Chicago Drainage Canal and running it into the Mississippi River. The ostensible reason is for sewage purposes, but incidentally a considerable amount of power is generated from this water from which, it is said, the Chicago authorities derive a by no means insignificant profit. Development of power on the Ottawa River (item *b*) seems likely to be undertaken by the Commission in the near future, but it would not be available for use in time to prevent a power shortage. The same objection applies with greater force to item (*c*) on account of the international problems which have to be solved, the magnitude of the undertaking, and the fact that the question of navigation is more or less bound up with that of the generation of power. Item (*d*) seems to have received a good deal of attention, particularly in Toronto, where the simultaneous supply of electrical energy and heat, combined with the possibility of establishing a coking plant which would supply coke for domestic heating and, presumably, oil and gas for power generation, has been under discussion. In the United States the supply of heat (using exhaust steam) as well as electricity is undertaken in a number of instances and seems to be making headway steadily if somewhat slowly.

The Commission is meeting the more immediate needs of the power situation by arranging to purchase power from Quebec Province. The Ontario Government has recently authorised the Commission to make a contract for the supply of from 230,000 to 260,000 h.p. with the Gatineau Power Co. The company will develop the power on the Gatineau River at a point near Ottawa and close to the boundary between Ontario and Quebec. Delivery of 80,000 h.p. is to be made in 1928 and the full amount by 1931. The contract is for 30 years, commencing with 1928, and the price of power at the point of generation will be $15 per h.p.-year. The Commission will build a 230-mile, 230,000-V transmission line to take the power to Toronto, where the total cost of the delivered power will be about $22 per h.p.-year. The capacity of the transmission line will be from 300,000 to 400,000 h.p., so that the needs of Eastern Ontario can be served, as later on power from other sources will be fed into the same transmission line.

Shortly after making an official statement regarding the power contract mentioned above, the Hon. Howard Ferguson, Premier of Ontario, made a most important and gratifying announcement to the effect that the Provincial Governments of Ontario and Quebec will in the very near future appoint a joint engineering board to survey and report on the power possibilities of the Ottawa River, the question of the remission of Quebec's export tax on power (50 cents per h.p.) in the case of the contract to be made between the Gatineau Power Co. and the Hydro-Electric Power Commission of Ontario, and the agreement between the two Provincial Governments to jointly resist any action by the Dominion Government to lease or sell any power sites of which either of the Provincial Governments claims to have the ownership. It is understood that the Provincial Government of Quebec has already agreed that the power to be exported to Ontario shall be free of the tax.

The full accord on all matters relating to power questions as affecting the two provinces which has thus been reached is of great significance as, owing to differences in race and in religious beliefs, the people of Quebec and Ontario have a tendency to look each on their own side of the shield without paying over much attention to the other. Consequently, any drawing together such as is indicated by the decision to create a joint engineering board is hailed as the forerunner of better relations all round.

Referring to the Gatineau River, a recent issue of the *Canadian Engineer* states that "acquisition of the Hull Electric Co. by the International Paper Co. will give the latter company practically full control of the Gatineau River as far north as the great water storage dams which are being built at Maniwaki." The International Paper Co. controls the Gatineau Power Co., which will supply power to Ontario as stated above.

The Institution of Electrical Engineers.

The Council's Annual Report and Accounts for 1925-26.

At the annual general meeting on May 27th the Council's report and accounts for the year April 1st, 1925, to March 31st, 1926, which are summarised below, were presented, indicating a net increase in membership of 399, which raised the total to 12,142; there were 67 deaths, 140 resignations, and 381 lapses of membership during the period under review; there are 11 honorary members. The A.M.I.E.E. examination was held at eight places in this country, and also in Australia, Ceylon, India, New Zealand, South Africa, and the U.S.A.

During the past 12 months 374 meetings were held in London and at the local Centres by the members, the Council, and the various committees. The interest in, and attendance at, the meetings of the local Centres and Sub-Centres have been well maintained, whilst the Wireless Section held eight meetings at which nine papers were read and discussed. In view of the suggested formation of a separate wireless society the Committee of the Section reported to the Council with a view to developing and extending the activities of the Section.

Eleven informal meetings have been held during the session, the average attendance being 65, as against 59 last year. There are at present 3,582 students on the register of the Institution, and meetings, visits to works, and social functions have been carried out at the eight Students' Sections now in existence. The London Students' Section created an interesting precedent last summer by holding a summer meeting in London, and in addition to London students it was attended by some 20 students from the provinces and Scotland.

The Faraday lectures this session were given by Mr. A. P. Trotter, who took for his subject "Illumination and Light," and were delivered at Cardiff, Dublin, Liverpool, and Manchester. The attendances were very satisfactory, and the principal object of the lectures, namely, to direct the attention of the general public to electrical engineering, was achieved to a marked degree by the presence of many hundreds of non-members.

The Council decided this session to publish in the *Journal* periodical reviews of progress in electrical engineering, and for this purpose the subject has been divided into 13 sections, a beginning having been made this year with six sections, and a further selection will appear in 1927. The reviews briefly record recent advances and are intended, not so much for the information of experts in the particular subject under review, as for the information of those members of the Institution who wish to follow the trend of progress in branches of electrical engineering other than their own.

A David Hughes and two Salomons scholarships were awarded by the Council, in addition to a grant of £100 for educational purposes from the War Thanksgiving Education and Research Fund (No. 1).

The annual conversazione was attended by 1,400 members and guests; the annual dinner was particularly well attended, members and guests numbering 575, and 350 members and ladies took part in the summer meeting.

At the third session, in June, 1925, of the Paris International Conference on Large E.H.P. Supply Systems the number of countries represented was 27, Great Britain being represented by seven delegates appointed by the Institution and 21 ordinary members; the number of papers presented was 98. At the New York meeting of the International Electrotechnical Commission, in April, 1926, 16 countries were represented, and there were 24 British delegates, including four appointed by the Council to represent the Institution. The Council, which took an important part in founding the Society of Radiographers in the year 1920 and (under that Society's constitution) had until last year nominated six out of the 18 members of the Society's Council, has withdrawn its nominees and terminated the Institution's connection with the Society because the majority of the Council of the Society of Radiographers resolved upon alterations to the Society's articles, which in the opinion of the Council of the Institution were not in the public interest.

The September, 1921, edition of the Model Conditions "A" (Home—with Erection) has been amended to make it clear that the regulations and by-laws with which the contractor has to conform are those which the local or other authorities are authorised by statute to make; the new edition (revised January, 1926) in all other respects conforms with the old edition. The following sets of conditions were also issued during the session:—B1. Conditions for Export Contracts (delivery f.o.b.); and B2. Conditions for Export Contracts (including complete erection, or supervision of erection).

The former five "Sectional Committees" have been reorganised as nine "Technical Committees," whose functions will be to obtain suitable papers on subjects within their respective fields and to assist the Papers Committee in connection with the reviews of progress referred to above. With the concurrence of the Council of the Institution and of the National Gas Council, a joint committee has been set up "to consider whether in the national interest an inquiry might advantageously be held into the possibility of closer co-operation between gas and electricity undertakings in promoting capital and fuel economy in the supply to the public of energy derived from coal."

During the year 163 books and pamphlets have been presented to the Reference Library, and 80 volumes have been purchased. The total number of readers for the year was 3,537, of whom 114 were non-members, as against 2,419 and 108, respectively, in 1924-25. The Council records the continued circulation of books from the lending library, to which 71 new volumes have been added; during the year, 1,938 books were issued to 857 borrowers, the corresponding numbers for the previous year being 2,184 and 872, respectively.

The number of applicants for posts who were registered by the Electrical Appointments Board on March 31st, 1926, was 87, against a total of 78 last year. The Council earnestly hopes that members in a position to assist will not fail to make use of the register.

The net cost of printing and posting the *Journal* in 1925, after allowing for sales and the revenue received from advertisements, was £4,166, as compared with £3,078 in 1924. This increase was due to the greater size of the volume (1,180 pages, as compared with 1,006 in the previous volume), the larger number of copies printed (12,500, as against 12,000), and an appreciable increase in the number of illustrations. The revenue from sales and advertisements was practically the same in the two years. The physics volume of *Science Abstracts* for 1925 contained 195 pages less than for 1924, and the electrical engineering volume contained 39 pages more than in the previous year; the net cost of the publication to the Institution in 1925 was £281.

The report of the Committee on Electricity in Agriculture has been published, and the Council has instructed the Committee (1) to prepare a special recommendation to the Government in connection with the provision of financial assistance for rural electrification, and (2) to co-operate with agricultural bodies in tests and experimental work. The Council has also addressed a letter to the Electricity Commissioners urging that, in any schemes of railway electrification, regard should be had to the requirements of rural areas.

Regarding the award of national certificates and diplomas in electrical engineering, for the final examinations of 1925 the Joint Standing Committee representing the Board of Education and the Institution examined at various schools and colleges students from 46 approved courses for the award of ordinary certificates in electrical engineering, 17 courses for higher certificates, 3 courses for ordinary diplomas, and 1 course for higher diplomas. The final examinations were held during the summer of 1925, and the number of awards was as follows:—229 ordinary and 79 higher certificates; 8 ordinary and 2 higher diplomas.

The Council has authorised the publication of a revised edition (the second) of the I.E.E. Regulations for the Electrical Equipment of Ships, and as a result of suggestions in connection with the revised edition of the Regulations for the Electrical Equipment of Buildings, the Wiring Rules Committee recommended the Council last summer to publish a small number of amendments which were considered to be of sufficient importance to justify their immediate publication. Further alterations have been, and some still are, under consideration by the Committee and, if not published separately, will be incorporated in the next revision of the Regulations. The Committee is also conferring with the B.E.A.M.A. and the B.E.S.A. in connection with certain of the Regulations.

The Council has approved for submission to the Electricity Commissioners a report from the Electricity (Supply) Regulations Committee containing recommendations on the Electricity Commissioners' Regulations (*a*) for securing the safety of the public, and (*b*) for ensuring a proper and sufficient supply of electrical energy. During the session the Council approved a report of the Proving House Committee, "having in view that there appears to be very little interest in the establishment of a testing authority and proving house," that the proposal be dropped.

In December, 1925, the Council received an invitation to join a delegation which the First Lord of the Admiralty had consented to receive on the status of engineer officers of the Royal Navy, which, it was considered, was detrimentally affected by the new conditions introduced by Fleet Order No. 3,241, of November 21st, 1925. Representatives duly met in conference delegates of the Institutions of Civil and Mechanical Engineers and of Naval Architects, and the deputation was received at the Admiralty on January 14th, 1926. A reply has since been received which is considered by the joint Conference as unsatisfactory, and steps are being taken to carry the matter a stage further.

The Committee of Management of the Benevolent Fund of the Institution reports that on December 31st, 1925, the capital account of the fund stood at £10,004 and the accumulated income at £2,380. The donations and subscriptions to the fund in 1925 amounted to £1,241. In 1925, 78 grants were made to 30 persons, amounting to a total of £1,199.

The Institution's annual accounts show that, after making provision for contingencies, there is a margin to the good on the revenue account for 1925 of £1,196, which has been carried to the credit of the general fund, and compares with £2,925 in 1924. The assets amount to £145,336.

The Annual General Meeting.

The usual small attendance was presided over by Mr. R. A. CHATTOCK, who drew attention to the chief items in the Council's report for the year, intimating at the same time that the summer meeting at Newcastle would be held there next year, it having been cancelled this year on account of the coal miners' strike.

Mr. E. W. Moss seconded the adoption of the report and accounts, and asked about the Registration of Engineers' Bill.

Mr. F. W. PHILLIPS asked about the possibility of arranging for the publications of engineering institutions to be obtainable abroad at reduced rates, and suggested that it would be more in keeping with the dignity of the award if the Faraday medal were made of gold or platinum. He then spoke of grievances which are said to exist on the part of some students who are transferred to the Graduate class, and urged the Council to make the Graduate class more attractive so that it would be regarded as a real step in the upward direction of membership. After commenting on the Council's action in issuing a circular in December in connection with members enrolling as volunteers in case of a national emergency, Mr. Phillips suggested that the time had come to reinstate "enemy" members.

Mr. F. W. PURSE said that although there was a total increase of 399 in the membership last year, it represented principally Students and Graduates, the fact being that in two years there had only been an increase of 17 corporate members; that could not be regarded as satisfactory for the premier engineering institution in this country. The Institution did not seem to be making the progress it should, for no fewer than 228 Students had lapsed last year and 77 had resigned. The average expense per member was about £2 10s., and the subscriptions of the Students did not cover that; the Council should review the position as regarded Students' subscriptions and also the relationship between full and associate membership, his point being that many Associate Members ought to be full Members, but they did not transfer because they got all the privileges for a lower subscription.

Mr. A. H. ALLEN commented on the fact that no reference was made in the report to the protest made by the Institution some time ago in connection with the Electricity Supply Bill, 1926, and expressed the hope that the matter would not be left there.

The PRESIDENT said it was not intended to take further action in connection with the Electricity Supply Bill, it being thought that the various sections of the Institution could better voice their own particular points of view with regard to the Bill; no decision had been come to with regard to the Registration of Engineers' Bill, and any necessary action would be taken when the occasion arose. The Faraday medal, after all, was given as an honour (not for its material value), and the Council felt that it should remain a bronze medal. He did not agree with the comments of Mr. Phillips as to the Graduate class, and he regarded it as a very useful class for those Students who could not, for the time being, take the associate membership examination. As to the strike, the Institution merely sent out the circular at the request of the Government without expressing an opinion, as the Council did not consider it within its province to take part in industrial matters. The fact that there had been only a small number of new corporate members during the past two years was due to the stiffening-up of the requirements for membership, and there need be no fear that the Institution was going back; it was essential to maintain the supply of Students, who, however, had not much money, so that they should "temper the wind to the shorn lamb" by fixing a small subscription for Students. The question of "enemy" members would be dealt with when the articles of association were next revised.

The accounts were adopted after the hon. treasurer had explained that the increase in expenditure of nearly £5,000 was accounted for by certain special items, such as the rewiring of the Institution building, which would not recur as an annual charge.

Electric Incubation.—It is known that eggs hatching under a hen vary in temperature by several degrees at the top and bottom. Although it is not known why this is desirable, experimenters in this country, according to *Science*, have tried to imitate the condition by covering artificially hatched eggs with a thin sheet of rubber to keep the top warmer; they claim a highly increased percentage in their hatch. Mr. Edmund Burke, Chemist at the Agricultural Experiment Station at the University of Montana, has, as the result of recent experiments, concluded that the electric incubator is the most satisfactory substitute for the hen. The temperature can be more readily controlled to simulate the required conditions than with the older types of hot-air incubators. Mr. Burke found in his experiments that the carbon dioxide and moisture given off by the body of the hen during hatching are necessary elements in the chemical changes that render the calcium of the shell available for the bone formation of the embryo chick. Electric incubators were found to be superior in reproducing this condition also. The amount of moisture and carbon dioxide could be more easily controlled than in the hot-air types, and the quantity of each admitted to the eggs approximated more nearly to the amount given off by the hen with a consequent increase in the hatching percentage of viable chicks.

Electroplaters' and Depositors' Technical Society.

Heavy and Rapid Copper Deposition.

A DISCUSSION on this subject was held at the Northampton Polytechnic Institute on April 14th. The opener, Mr. J. S. SUNDERLAND, dealt principally with the deposition of printers' electrotypes, but subsequent speakers, Mr. F. S. SPIERS (since deceased), Mr. A. E. OLLARD, and Mr. D. J. MACNAUGHTON among others, spoke on the process of manufacture of heavy copper cylinders, such as are used by calico printers, copper engraved printing plates, the reproduction of chased or modelled decorative panels, and other processes where deposits of considerable thickness are required.

It is well-known that the rate at which the electrodeposition of copper can be maintained and the quality of the deposit, both as regards mechanical properties and smoothness, are determined by the following factors:—(1) Composition of the solution; (2) its temperature; (3) the rate of agitation of the solution; (4) the presence of so-called "addition agents." As regards (1) all experience shows that a solution consisting of about 14-18 per cent. crystalline copper sulphate and 4-6 per cent. free sulphuric acid is the most satisfactory for most purposes and within that range any composition will yield satisfactory metal if the other factors are suitably adjusted. It appears that a solution approximating to 15 per cent. sulphate and 5 per cent. acid happens to be the optimum composition for maximum current efficiency at the cathode combined with minimum corrosion of the electrodes by chemical action. Too high a concentration of copper in solution tends to yield soft deposits—that is, of large crystalline structure—unless the acidity also be high, and then the solubility of the sulphate is diminished, so that on cooling the solution the salt may crystallise out on the electrodes, rendering them non-conducting.

The advantages of working at high current densities are increase of output, and thus a diminution of capital charges, and a good mechanical quality of deposited metal. For such purposes as printing plates the latter requirement is essential, and it is also necessary that the deposits should be extremely smooth. Both conditions can be satisfied if the solution be adequately agitated, and one speaker advocated the procedure of driving the solution between anode and cathode by means of suitable pumps, as being a far better method than the employment of blowers, agitators, or fans. Of course, in certain uses, such as the manufacture of copper tubes, the cathode itself can be revolved at a high speed on a mandrel, as in the Cowper-Coles process. In either case, there is a beneficial quasi-burnishing effect of the solution on the cathode which tends to harden the deposit, as well as the rapid renewal of electrolyte close to the deposit required when a high current density is employed. The "treeing" which occurs along the edges of a deposit when a high current density is used can be reduced, if not eliminated, by keeping the solution perfectly clear and free of suspended matter. In some processes the solution is being constantly filtered while circulated, and it may sometimes be advantageous to enclose the anodes in bags to prevent the anode-sludge from contaminating the solution.

Changes in the constitution of the solution were referred to in the course of discussion. It was pointed out that current at the cathode converted cupric into cuprous ions, and that but for the free acid present cuprous oxide would be deposited. The presence of cuprous copper might be the cause of a change in the colour of solution from blue to green often observed. From such solutions copper inferior in mechanical qualities would be deposited and one remedy was to oxidise it by means of aeration. This reaction, as well as ordinary chemical corrosion, would usually cause more copper to dissolve than was deposited, an effect accelerated by high current density and rapidity of agitation, so that solutions usually needed periodical readjustment due to enrichment by copper.

Where copper of high tensile strength or hardness was required it was desirable to apply mechanical tests, a procedure not sufficiently practised in this country. The use of Brinell hardness tests, in particular, was recommended. The curious phenomenon was referred to of the influence of the cathode material on the crystalline structure, and hence mechanical properties, of the deposit. Copper deposited on plaster was large-grained and therefore inferior in quality to that deposited on wax, for example; and even the treatment of the surface, such as graphiting and silvering, had an effect on the grain. The reason for this was pointed out many years ago by the late Professor A. K. Huntington, who proved experimentally that the first layers of an electrodeposited metal tended to conform to the crystalline structure of the base metal. It was stated that to obtain copper of the highest ductility and tensile strength it was necessary to have recourse to one or other of the colloidal organic substances added in minute qualities to electrolytic solutions. Experience could indicate to a nicety how much to add from time to time, the quantity depending mainly upon the acidity of the solution and the amount of work it was called upon to perform.

The discussion generally must have been of considerable value to those engaged in the practical art of copper deposition and was a tribute to the utility of the newly-formed Society.

The Electric Drive of Reciprocating Machine Tools.

The Ward-Leonard v. The Single-Motor System.

By L. MILLER, A.M.I.E.E.

(*Abstract of a paper read before the* MANCHESTER ASSOCIATION OF ENGINEERS.)

THE paper discusses investigations carried out by the author, assisted by certain members of the staff of the Metropolitan-Vickers Electrical Co., into the question of developing a satisfactory drive for the table of a planing machine. At the time the investigations were started the most successful drive was the Ward-Leonard. The single-motor drive utilising d.c. from the power mains was a very bad second. Its lack of success appeared to be due to trouble with the control gear, but the application of contactor gear solved the difficulties, with one exception, *viz.*, the prevention of the table of the planing machine coming off the slides in the event of failure of voltage. This difficulty was eventually overcome by utilising a series winding on the motor to provide excitation on the failure of the power. This winding was connected so as to obtain dynamic braking at the instant of reversal, but not in the current-carrying circuit, except when stopping and starting in the reverse direction at the end of the stroke, or on failure of power.

From oscillograph curves taken from planers equipped with the single-motor drive and also the Ward-Leonard drive, it is clear that the acceleration curve for the planer table is such that on short-stroke work the planer table cannot achieve full speed before a reversal takes place. This is true of either the Ward-Leonard drive or the single-motor drive. The actual effect of this on the time occupied in completing two reversals, a cutting stroke at 42.4 ft. per minute and return strokes varying from 51.4 ft. per minute to 150 ft. per minute (or a complete

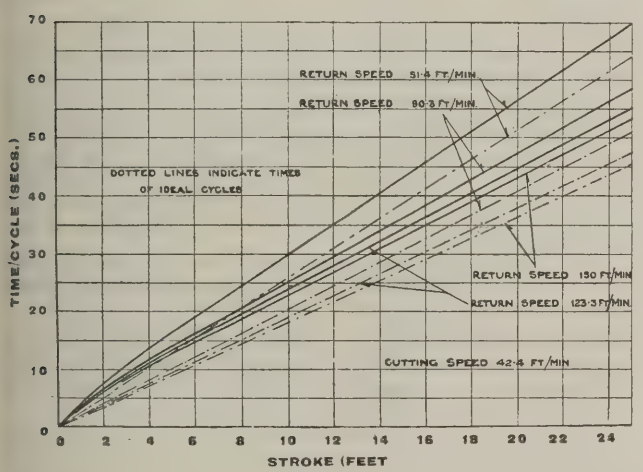

Fig. 1.

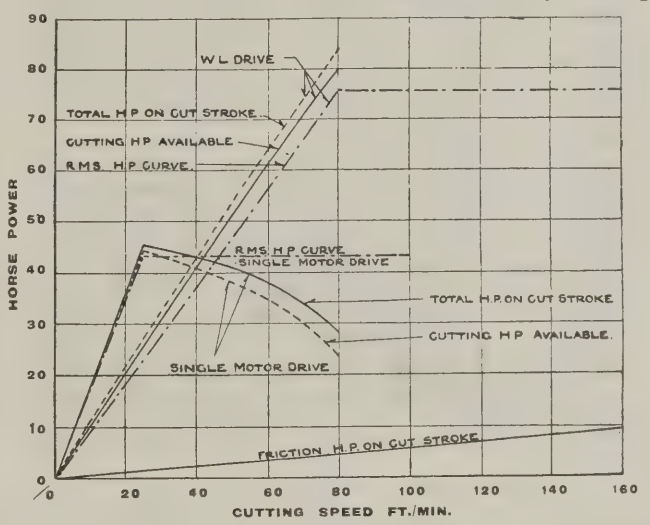

Fig. 2.

cycle) for different lengths of stroke, is shown in fig. 1. The straight lines on the curve indicate the ideal time of one cycle, that is, the time occupied on the assumption that the planer takes no time to reverse, and immediately reaches speed on either stroke. These results were taken for a very heavy planer of an old type, that had been converted to electric drive. These curves make clear the fact that the saving in time between a return speed of, say, 100 ft. per minute and one of 150 ft. per minute amounts to not more than 8 per cent. on the large planer. They also show that the loss of time due to reversing and accelerating is very small indeed, and nothing like as much as would be at first anticipated. At 1/5 of the maximum stroke on the large planer, it amounts to 2.93 per cent. and on the maximum stroke 2.28 per cent., an average of about 2.6 per cent. The power required to return the table at 150 ft. per min. is 50 per cent. greater than that required to return it at 100 ft. per min. An objection to returning the table at a high speed is that it is often very difficult to secure the work to the table in such a way as to ensure that it will not move when accelerating and retarding on the high-speed stroke.

In order to get a high-speed return, say, of 150 to 180 ft. per minute, with a minimum cutting speed of, say, 25 ft. per minute, by shunt field control, it would be necessary to utilise a Ward-Leonard equipment, since the single-motor drive would only give about 100 ft. per minute with a minimum of 25 ft. per minute by shunt field control. The extra cost of the Ward-Leonard equipment, compared with a single-motor equipment, is approximately 70 per cent., and it is very difficult to justify such a capital outlay. This difficulty is further increased when it is realised that, if heavy cuts at low speeds can be taken, the single-motor equipment is capable of removing considerably more metal in a given time than the Ward-Leonard equipment in spite of the high-speed return.

The single-motor drive can only give a maximum difference of speed between the lowest cutting speed and the highest return speed of one to four without dissipating some energy in resistances. This is due to the fact that it is not regarded as commercially feasible to build a motor having a greater speed range than one to four. It is possible, however, to get a wider range by a double-voltage system, or by means of resistances connected in the armature circuit. It is also possible by suitably arranging the resistance to obtain very little speed variation with load, and some very successful drives are operating with this form of control embodied. On the other hand, the Ward-Leonard drive, since it is a self-contained power unit, will give almost any reasonable speed range up to a maximum of one to ten. This speed range is obtained by varying the voltage of the generator up to about half of the maximum speed, and varying the field of the motor driving the planer to obtain the other portion of the speed range.

The Ward-Leonard equipment has its motor running at the top speed for a much higher table speed than the single-motor drive. As a consequence of this the motor of the single-motor drive runs at a much higher speed than that of the Ward-Leonard drive on the cutting stroke for the same cutting speed. Therefore, the single-motor drive has to deal with considerably more stored energy on the cutting stroke than the Ward-Leonard equipment. The effect of this, in reducing the available h.p. for cutting metal, is clearly indicated in fig. 2. This means, of course, that in actual fact it would be possible to push up the speed of the Ward-Leonard motor and to make a reduction in the price by doing so without seriously affecting its cutting characteristic at normal cutting speeds. The exact difference in the cost between the two drives depends upon the design of the Ward-Leonard set.

The h.p.-speed characteristics of the Ward-Leonard and single-motor drive are shown on fig. 2. Characteristic curves have been drawn for the r.m.s. h.p. and for the actual h.p. available for cutting in both cases. The root-mean-square characteristic indicates that constant h.p. is obtained with the Ward-Leonard drive from 80 to 160 feet per minute, and constant torque from 80 feet per minute downwards. The curve showing the power available for cutting also indicates the same characteristics except that, of course, reductions have to be made for the friction load at the high speeds and the stored energy at reversal. The effect of these factors is clearly indicated on the curve. The r.m.s. curve for the single-motor drive indicates constant h.p. from 25 to 100 ft. per minute, and constant torque by control of the voltage by means of resistance in the armature circuit from 25 feet per minute downwards. The power available for cutting is also clearly indicated on this curve, and the effect of the stored energy and friction load is clearly indicated for the various speeds. It will be seen that the effect of the stored energy is nothing like so great in the case of the Ward-Leonard equipment as it is in the case of the single-motor drive. In spite of this, however, it is clear from the curves of the Ward-Leonard equipment that it is not possible to take a bigger cut at 25 feet per minute than it is at 80 feet per minute, whereas with the single-motor drive it is possible to take a cut at 25 feet per minute of practically six times the area at 80 feet per minute. This characteristic conforms more nearly to that required for removing metal than the Ward-Leonard characteristic, and also a great deal more metal is removed at low speeds when heavy cuts can be employed.

The power available at the low speeds, in the case of the single-motor drive, enables it in practically all the cases investigated to remove more metal in a given time than the

Ward-Leonard equipment, in spite of the very considerably higher speed return. It is also seen that the high power, which can be obtained at high speeds with the Ward-Leonard curve, cannot be used because it usually falls outside the limit of cutting speed. The characteristic, with the 1 : 2 speed range on the motor, is very bad in this respect, and fails to give adequate power at the low speeds, and in fact is really not suitable for removing metal. The characteristic with the 1 : 4 speed variation is better, and conforms more nearly with that of the single motor drive. It is apparent, however, that the results obtained with the Ward-Leonard equipment cannot justify any increased cost, except in such cases where it is impossible to remove heavy cuts. In order to get any advantage from the Ward-Leonard drive sufficient to warrant the extra cost, it would be necessary to increase the distance between the two limit curves. This can only be done by decreasing the time per cycle, which is practically impossible.

Notes from South Africa.

(From Our Special Correspondent.)

Durban Bulk Supply.

AN agreement has been prepared between the Electricity Supply Commission of South Africa and the Durban Town Council embodying certain amendments which have now become necessary consequent on the decision of the Commission to purchase two 6,000-kW turbine sets and two 60,000-lb. boiler equipments from the Durban Town Council when the Council's present station shuts down on its taking supply from the Commission. It may be remembered that the original agreement was entered into in March, 1925, and provided for a supply of 9,000 kW and 48,000,000 units per annum, the charges being :—A fixed charge at the rate of £33,500 per annum, or £3 14s. per kW, and a minimum of 48,000,000 units at 0.29d. The amendments to the agreement are that the basis be fixed at 14,000 kW at a standing charge of £5 8s. per kW, and 60,000,000 units at 0.2d. per unit, which will operate from about January, 1929, by which date it is hoped that the Commission's plant will be installed and in working order at the Congella (Durban) power station.

While the existing agreement shows a load factor of 61 per cent., the new proposal will not be so high, being 49 per cent. Though at first sight it may not appear to be so advantageous to the Durban Town Council, the new scale will certainly show a distinct saving when its consumption exceeds the 60,000,000 units, which, judging from the present rate of growth, is likely to be the case well before supply is available, as it is estimated that by July, 1928, the Durban power station will be turning out well over 70,000,000 units, in view of the present demands that its cheap supply of current has brought about for cooking and heating, &c. The Commission station will thus have installed two 6,000-kW and three 12,000-kW sets and eight large boilers fitted with pulverised fuel firing apparatus, and it is anticipated that an early start will now be made with the foundations and buildings. The agreement is for a term of 30 years.

Pietermaritzburg (Natal) Bulk Supply.

An agreement has also been prepared between the Electricity Supply Commission of South Africa and the Pietermaritzburg Town Council in regard to supply of electricity in bulk to that city from the Commission's power station at Colenso. The agreement will date from August 1st, 1927, to July 31st, 1932, and the charges are as follows :—

(1) A fixed charge of £150 per annum, plus £5 per kVA of maximum demand.
(2) A charge of 0.3d. per unit for the first million units.
0.2d. per unit for the next two million units.
0.15d. per unit for all over.

The change-over to the Commission supply will mean drastic alterations in the distribution system, as the supply at present is single phase, 100 cycles, whereas the Commission's supply is three-phase, 50 cycles.

Durban Time Clock.

Durban has for many years made use of its electricity supply for indicating the time by the dimming of the lights at 8 p.m. by the insertion momentarily of extra resistances in the field exciter circuits of the generators at the power station, but it is now proposed to go one better and have the time controlled throughout the whole 24 hours by those who wish to install such clocks, which will be of the synchronised type. The master clock has already arrived, and will shortly be put into operation, so that Durban will be the first town in South Africa to introduce this service, and perhaps it may be ahead of many a Home town in having municipal synchronisation of time.

Trade Mark for C.M.A. Cables.—It is announced that as the result of certain cable manufacturers at home and abroad who are not members of the Cable Makers' Association applying to their own products the term "non-association grade," the trade mark Nonazo has been registered in the name of the C.M.A. This name is to appear on the labels of "Non-Association" class cables made by members of the Association.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Earth Tubes in Radio Sets.

Radio users should be indebted to Mr. Paul D. Tyers for his article in your issue of May 7th. With reference to water-pipe earths, he remarks that "the efficiency depends upon the actual conditions of each specific example"; I think this is even more applicable to driven earth tubes, as those which give poor results are as a rule not properly designed for use in the ground which is usually found near a house, but may be satisfactory in a moist flower bed. For this reason, I prefer an iron tube with a welded spike, which can be driven, if necessary, through a gravel path; by filling the tube with carbon, kept moist in dry weather, I utilise the internal surface of the tube, the carbon surrounding the earth wire. I received the following account of a two years' test from the technical expert of a well-known company: "Your tubular earth was driven through brick rubbish and stones just below the window, where the set is installed, and there is not the slightest difference between this and the water main earth."

If Mr. Tyers will make a test, I am sure the G.E.C., who supply the device, will be very pleased to give every facility.

Killingworth Hedges.

London, *May 25th*, 1926.

The Independent Power Plant.

One of the first steps taken by the Government to deal with the situation created by the General Strike was to restrict the use of electric power. As a direct consequence, many works were compelled to work short time, although they were really in a position to carry on normally. The resulting loss to the firms concerned, and the hardship to their employés, were, unfortunately, unavoidable, and everyone must agree that the Government acted wisely in imposing the restrictions.

The very fact that these restrictions were necessary does, however, make one wonder whether the Government will still proceed confidently with its electricity scheme.

The General Strike has forcibly demonstrated the value of the independent power plant. Manufacturers who generated their own power, and were, consequently, not dependent on the electric power stations, found themselves in a very favourable position, and it is certain that many of those who suffered under the restrictions will profit by the lessons the strike has taught them, and will install their own power plant at the earliest opportunity.

Cheap and plentiful power is one of the country's greatest needs, but it is a great mistake to assume that super power stations are the only means of providing it.

Power can be produced now in private plants quite as cheaply as (and in some cases even cheaper than) the super power stations will be able to distribute it. (It is, of course, the distributed cost that the consumer will pay, which is quite a different thing from the cost of production.)

In common with most other makers of power plant, we can show the manufacturers of this country how to produce electric power and light for use in their own works, at from ½d. to 1d. per unit (everything included), at the same time rendering them quite independent of power station strikes or lockouts.

Country-House Fires.

Having followed the correspondence in connection with the above, I should like an opportunity of replying to "Engineer Surveyor." Speaking generally, I have not found any great difficulty in obtaining tests provided the client is approached in the right manner. What is often refused when insisted on is generally obtained when asked for. I also think "Engineer Surveyor's" remarks *re* the non-tariff companies are in the way of a cheap advertisement. I can assure him that as far as my own company is concerned I have yet to find it accept any risk that I, as its electrical surveyor, turn down. What I consider to be even more important than an occasional test is an inspection during the time that the installation is being put in.

Electrical Surveyor
(NON-TARIFF).

Electricity Meters.

Both your leaderette and your correspondent emphasise the fact that meters may go either slow or fast owing to the instability of the permanent magnet.

The Bastian Meter Co., Ltd., have for many years been working to produce a meter *without* this so-called permanent magnet, and I am happy to inform you that their efforts have now been crowned with success.

After a great deal of research work a method of overcoming this difficulty was invented and a meter on this invention has been designed, tested, and patented. Work is in progress now to place this meter on the market on a commercial scale.

F. J. Campbell Allen,
Managing Director BASTIAN METER CO., LTD.
London, *May 31st*, 1926.

Legal.

McCarthy v. Leicestershire and Warwickshire Electric Power Co.

AT the Ashby County Court on May 20th, Michael McCarthy, New Swannington, sued the defendant company for damages and an injunction in respect of poles erected by the company on his land at Coalville. Mr. F. W. WALLACE, for the defendants, stated that the land was in no sense building land, and it was not possible that the value of the land had been seriously reduced by the erection of the poles, as was alleged by the plaintiff. Colonel GERMAN, a witness for the defendants, said the land was quite unsuitable for the erection of dwelling houses. It was almost tucked under a railway embankment, where the coal from seven collieries was collected, and shunting went on day and night. After a long hearing Judge T. E. HAYDON said that the railway traffic at the spot made it an impossible site for houses, but he was not satisfied that the land could not be made use of as a site for factories. He estimated the value of the land at 10d. per square yard; and in his view the erection of the poles halved the value of the land. He was therefore in favour of plaintiff for as many fivepences as there were square yards in the plot affected. The exact amount having been ascertained his Honour gave formal judgment for plaintiff for £3 10s. 10d., plus the amount paid into Court, in all £15 18s. 4d. Costs were awarded on Scale B and the injunction was refused.

An Electric Stove Exonerated.

BEFORE Judge Cluer, in the Whitechapel County Court, on May 21st, Esther Libstein, Clapton, E., sued Mr. S. Skropski, Whitechapel Road, E., to recover £7 7s., damage done to a coat through the alleged negligence of the defendant. Mr. White appeared as counsel for the plaintiff and Mr. Walter Stewart, barrister, for the defence.

In opening the case, Mr. WHITE said the suit was a novel and peculiar one. The plaintiff went into the defendant's shop to make a purchase, and at the time there were three other customers there. The shop not being a large one, she went into a corner of it and had not been there long before she noticed a smell of burning and discovered her coat was alight. This had been caused by its coming into contact with an electric stove, and irreparable damage was done. He (Counsel) submitted that it was negligent for a shopkeeper to have an electric stove in his shop, unprotected, and without giving the plaintiff any warning of its presence.

The plaintiff gave evidence in support of Counsel's statements and said she called the attention of the defendant to the ridiculous place in which the stove had been put.

For the defence, DAVID ANDERSON, an employé of an electrical firm, said that this stove or radiator was fitted up behind the counter, but had a flexible lead about two feet long; it was capable of scorching at a distance of six or seven inches.

Judge CLUER said he did not wish to hear any further evidence. Negligence had been alleged but not proved, and this stove was not in the nature of a trap. The stove was in a reasonable position and therefore there was nothing in the nature of a trap, as when it was on a certain amount of light would be given off, which could be seen by anybody using reasonable care. The plaintiff had not proved negligence, and judgment would be given for the defendant, with costs.

Theft of Radio Valves.

AT Old Street Police Court on May 28th, Arthur Ernest Peers, Bethnal Green, was charged with stealing five radio valves, value £2, the property of his employers, the London and North-Eastern Railway, from Bishopsgate goods depôt. He was found guilty and sent to prison for one month.

Stepney Councillor Fined.

The Times reports that on May 27th Daniel Frankel, Mile End Road, E., a member of the Stepney Borough Council, was at the Thames Police Court fined £25 and ordered to pay £5 5s. costs for unlawfully committing an act calculated to injure or to prevent the proper use or working of the shop and bakery of Israel Kossoff, by threatening to cause the electric power to be withdrawn. Evidence was given that during the recent strike the defendant, who was chairman of the Stepney Trades Council, sent a letter to Kossoff, from the "Stepney Council of Action," stating that the Council's attention had been drawn to the trade dispute which had occurred between him and his workmen, suggesting an immediate settlement, and stating that unless the council heard from him it would be compelled to consider the recommendation of a withdrawal of electric light and power as far as his premises were concerned. The defendant said that, as a fact, he was not aware at the time the letter was written that the current had been already cut off. The object of the letter was to prevent trouble arising, in view of the general strike.

False Pretences Charge.

AT Hull, on May 31st, Edward W. Clark was charged with having obtained £1,000 from Mr. W. F. Shuttleworth, a director of the Humber Electrical Engineering Co., by false pretences. It was stated that the accused had obtained nearly £8,000 in connection with patents which he proposed to exploit. The prosecution alleged that forged documents purporting to bear the signature of Sir George Thurston had been produced by the accused. Clark's counsel applied for bail, stating that previous patents of the accused were very valuable, but development had been retarded by the shipping depression. The accusations of forgery were denied. Bail was refused, and a remand to June 10th was ordered.

Reviews.

Industrial Electricity, Part II. By CHESTER L. DAWES, S.B., M.A.I.E.E. Pp. xv + 480; figs. 431. London: The McGraw-Hill Publishing Co., Ltd. Price, 13s. 9d.

The first volume of this work, which is concerned with direct current circuits, has already been noticed in our columns. The present volume, which, like its predecessor, is largely of a descriptive nature, deals at length with the flow of alternating current in circuits and with electro-magnetic appliances for use on alternating current mains. In addition, there are chapters dealing with the transmission and distribution of electrical energy, illumination and photometry (though little matter is given concerning the art of illumination), thermionic valves and their uses, and the interior wiring of buildings. The chapter dealing with the last named subject seems to lie outside the general scheme of the rest of the book and in any event will not be of general utility to readers in this country since it deals with methods and conditions which are usual in America.

The general mode of treatment in the book is one involving only the simplest mathematics, considerable use being made of wave and vector diagrams, though it is rather surprising to find that the chapter on the transformer does not contain a single vector diagram since one would have thought that they could have been used with good effect in explaining the action of this appliance. The chapter on the thermionic valve and its uses may be well commended as giving a very useful account of the present state of this branch of electro-technology.

The book appears to be accurately written and the only error of moment which we have observed is on page 74, where it is stated that the *natural frequency* of the oscillations of current in an oscillatory circuit is given by the expression $f=1/2\pi\sqrt{LC}$. This formula is only true if the resistance of the circuit is zero. When there is an appreciable resistance, though not of sufficiently large an amount to render the circuit non-oscillatory, the frequency of the natural oscillations has a somewhat different value which can be found by a well-known formula.

The work concludes with a large number of examples, including some dealing with purely trigonometrical matters which seem rather out of place. The value of these examples would be increased if answers were given to those involving numerical working.

The book is well supplied with illustrations, including many half-tone blocks, and will perhaps be found most useful by those engineers and students who are studying electrical engineering as a subsidiary subject and do not desire to enter too deeply into details of matters of an electrical engineering nature.

Illuminating Engineering. Prepared by a Staff of Specialists for Students and Engineers. Edited by F. E. CADY, B.S., and H. B. DATES, E.E. Pp. xiii + 486; figs. 162. London: Chapman & Hall, Ltd. Price, 25s. net.

This volume is something of a departure in literature on illumination. It is a textbook based on six years of experience of a course in illuminating engineering. The Editors are respectively Mr. Frances E. Cady, of the National Lamp Works of the General Electric Company, and Professor Henry B. Dates, head of the Electrical Engineering Department at the Case School of Applied Science, where the course was held. The fourteen chapters, based on this series of lectures, are contributed by experts on the various phases of illumination discussed.

This method of treatment presents certain advantages and also some possible drawbacks. Each subject being treated by an expert one may expect accurate and up-to-date information; but careful editing is necessary to avoid gaps or duplication of matter. On the whole the editors seem to have been successful in avoiding the latter difficulties. The earlier chapters are devoted to the physics of light-production and sources of light. It is desirable that students should have a good knowledge of such principles and the treatment is adequate. The nature of spectra, black body radiation, the distinction between incandescence and luminescence are discussed and the distribution of energy in the spectrum with rising temperature is illustrated. It may be noted that the highest luminous effi-

ciency theoretically possible, in the most efficient yellow-green region of the spectrum, is 670 lumens per watt, whilst a body radiating in much the same manner as the sun, but yielding no non-visible energy, would operate at about 250 lumens per watt. For black body radiation 90-95 lumens per watt is the limit—but even this is far greater than the highest efficiencies (10 to 30 lumens per watt) obtainable from commercial illuminants.

A brief account is given of the sun as an illuminant. Gaseous light-sources are then discussed, after which electrical illuminants are treated. This section is well done and incandescent lamps are particularly fully treated. We notice a complete and useful diagram comparing the distribution of energy in the spectra of the chief electric illuminants. Neon lamps are somewhat cursorily dismissed, whereas a considerable amount of attention is devoted to mercury vapour lamps and their operating mechanism. The apparent absence of any account of mercury vapour lamps using quartz tubes seems a rather marked omission. The space devoted to the Nernst lamp (following the treatment of vapour lamps and somewhat out of place), might preferably have been used for a brief account of the quartz tube lamp and the special nature of its radiation.

The treatment of photometry is on sound lines, though the illumination photometers described are either American or German; the Bechstein instruments (described as "Beckstein") are singled out for special reference.

After a chapter by Professor Cobb on Physiological Optics, we come next to the use of polar curves, calculations and various forms of globes, shades and reflectors. There is a table of foot-candle intensities, and it is interesting to observe that data are presented in two parallel columns, one containing "recommended" values, the other showing the range of illuminations applicable in practice. The ingenious "guide to the selection of reflecting equipment," in terms of efficiency, favourable appearance, glare, &c., which is a feature of recent American literature, is also included; 28 different typical units are thus illustrated and appraised. Other tables deal with coefficients of utilisation on familiar lines. The chapter entitled "Light Shade and Colour" makes interesting reading. The hints subsequently given on natural lighting of buildings are sound, though one misses any reference to the "daylight factor," widely used in this country.

The final chapters on applications (domestic and industrial lighting, illuminated signs, street-lighting, &c.), are well handled and contain a good review of these problems in the space available. The book is exceptionally well illustrated, and although it is naturally based on American experience and written primarily for students in the United States, it is well worth study by those in this country concerned with illumination.

Trade-Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from May 12th. In the case of foreign applications, the names and addresses of the British representatives are given in parenthesis :—

Elektrophit. No. 468,005. Class 4. Electrical and galvanic carbons, and graphite, raw or partly prepared, for use in manufactures. No. 468,006. Class 6. Brushes and commutators for dynamos and electro-motors.—The firm of C. Conradty, Nuremburg, Germany. (S. Sokal, 1, Great James Street, Bedford Row, W.C.1.)

Dimic. No. 466,936. All goods in Class 8.—L. McMichael, Ltd.

Ecco. No. 467,463. Class 8. Batteries, cells, accumulators, and Leclanché cells.—Ecco Battery Co., Ltd., 5, Bow Common Lane, E.3.

Millgate (lettering and design). No. 467,840. Class 8. Electric batteries (not for medical purposes), coils, coil holders, thermionic valves and holders, condensers, transformers, and headphones.—The Chorlton Metal Co., 60, Long Millgate, Manchester.

The Electro-Hit. No. 468,398. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Homophon Gesellschaft, Berlin. (J. E. Evans-Jackson & Co., 57-60, Holborn Viaduct, E.C.1.)

Deckorem. No. 468,477. Class 8. Apparatus for use in radio-telephony and telegraphy.—Arthur F. Bulgin, trading as A. F. Bulgin & Co., 9-11, Cursitor Street, W.C.2.

Antix. No. 468,077. Class 11. Lead glass, lead-loaded india-rubber and similar appliances for use as protection against X-rays.—Watson & Sons (Electro-Medical), Ltd., 43, Parker Street, W.C.2.

Perfecta. No. 466,817. Class 13. Steel tubes and steel electric conduits.—Perfecta Seamless Steel Tube and Conduit Co., Ltd., Birmingham.

Cosmos Lamps (lettering and design). No. 468,879. Class 13. Electric lamps.—Metropolitan-Vickers Electrical Co., Ltd.

Sax (lettering and design). No. 468,204. Class 18. Electric bells and alarms (as systems in buildings).—Julius Sax & Co., Ltd.

Published Specifications.

Compiled expressly for this journal by Patent Agents.

The name of the applicant's patent agent, if any, will be found on the printed specification.

The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

24,819. "Frequency and voltage regulation of self-excited dynamo-electric machines." British Thomson-Houston Co., Ltd. October 18th, 1923. (223,599.)

24,926. "Lamps for use in producing photographic records of electrical variations." T. W. Case. October 20th, 1924. (251,307.)

30,810. "Copying telegraphy." L. Semat. July 25th, 1924. (237,549.)

30,862. "Liquid rheostats." A. Gray (legal representative of B. Gray, deceased) and R. Curtis. June 16th, 1924. (227,431.)

1925.

1,151. "Rotary distributors for use in telegraph or like systems." Automatic Telephone Manufacturing Co., Ltd., H. H. Harrison, and S. R. Smith. January 14th, 1925. (250,996.)

1,632. "Electric coils." Fuller's United Electric Works, Ltd., and A. P. Welch. January 19th, 1925. (251,000.)

1,755. "Systems and apparatus for electric distant-control or signalling." M. E. A. Baule. January 21st, 1924. (228,166.)

1,883. "Electrodeposition of nickel." E. A. Ollard and Metropolitan-Vickers Electrical Co., Ltd. January 21st, 1925. (251,010.)

1,905. "Manufacture of fixed electric condensers." Paralite Composition Co., Ltd., and W. A. M. Valon. January 21st, 1925. (251,012.)

1,984. "Vacuum electric tube devices." R. W. Lunt. January 22nd, 1925. (251,015.)

1,993. "Electromechanical telephone systems." F. Aldendorff. January 26th, 1924. (228,173.)

2,077. "Electrolysis or splitting-up of air or water." T. D. Kelly. January 23rd, 1925. (251,021.)

2,208. "Variable coupling-devices for alternating-current coils." British Thomson-Houston Co., Ltd., and J. Hutt. January 24th, 1925. (251,025.)

2,625. "Electric switches." British Thomson-Houston Co., Ltd., and P. T. Harris. January 29th, 1925. (251,034.)

3,182. "Thermionic valve circuits for wireless signalling and like purposes." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). February 4th, 1925. (251,041.)

3,519. "Electric generating plants operated by windmill power." L. Constantin and P. Fortier-Beaulieu. February 11th, 1924. (229,290.)

5,053. "Variable electric condensers." C. G. Hofman and L. C. Hofman. February 24th, 1925. (251,049.)

5,083. "Armatures for dynamo-electric machines." W. B. Sayers and P. Baxter. February 24th, 1925. (251,050.)

5,262. "Variable resistances." W. Knorr, W. A. Appleton and J. Joseph. February 25th, 1925. (251,053.)

7,260. "Electric connector or adaptor." General Electric Co., Ltd., and W. Manchester. March 17th, 1925. (251,068.)

7,648. "Electric switches." G. Edmonds, Ltd., and H. Edmonds. March 21st, 1925. (251,071.)

7,758. "Thermionic valves." W. R. Bullimore. March 23rd, 1925. (251,073.)

7,769. "Means for connecting electric conductors." F. V. Collins and L. F. Mayersbach. March 23rd, 1925. (251,074.)

8,172. "Receiving systems for high-frequency electrical oscillations." H. Wade (Carborundum Co.). March 26th, 1925. (251,078.)

8,243. "Electric cables." Siemens Bros. & Co., Ltd., A. E. Foster and H. G. Wood. March 27th, 1925. (251,081.)

8,686. "Electric fuses." Electrical Improvements, Ltd., R. W. Gregory and L. C. Grant. April 1st, 1925. (251,085.)

10,262. "Electric motors." A. H. Midgley. April 20th, 1925. (251,095.)

10,295. "Lead accumulators." Soc. Anon. Le Carbone. June 14th, 1924. (235,530.)

10,302. "Machines for helically winding wire on a travelling mandrel wire." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. April 29th, 1924. (233,330.)

10,372. "Lead accumulators." Soc. Anon. Le Carbone. December 11th, 1924. (Addition to 235,530.) (244,399.)

11,115. "Electric heaters." G. Wilkinson. October 5th, 1925. (251,099.)

11,390. "Sound-diaphragms and the like." Soc. Française Radio Electrique. May 3rd, 1924. (233,356.)

13,152. "Starting switchgear for electrical coal-cutting machines." W. A. Logan. May 20th, 1925. (251,114.)

13,354. "Loud-speaking telephone." C. A. Vandervell & Co., Ltd., and A. L. Murrell. May 21st, 1925. (251,116.)

14,361. "Sound amplifiers." C. H. Payne. June 2nd, 1925. (251,125.)

15,254. "Electric polyphase current arc lamps." E. Steinberg. June 12th, 1925. (251,129.)

16,012. "Relay mechanism responsive to voltage control." R. Wetzer. June 20th, 1925. (251,137.)

18,715. "Articulated coupling adapted to permit misalignment of two shafts, especially for power transmission in electric railway vehicles." Maschinenfabrik Oerlikon. September 1st, 1924. (235,179.)

19,276. "Electron-discharge devices." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Bell Telephone Laboratories, Inc.). July 29th, 1925. (251,149.)

19,776. "High-voltage cables and methods of maintenance." Standard Underground Cable Co. February 5th, 1925. (247,143.)

19,810. "Loud-speaking devices for wireless receiving apparatus." J. Piquart. August 6th, 1925. (251,151.)

22,108. "Method of and means for use in binding insulated electrical conductors or insulating bare conductors or the like." P. F. Hellermann. February 9th, 1925. (247,147.)

22,760. "Frequency transformers." Telefunken Ges. fur Drahtlose Telegraphie. September 12th, 1924. (Addition to 238,559.) (239,873.)

23,806. "Device for indicating sparking and other disturbances and for automatically cutting-out transformers, choke coils, and other electrical apparatus operating in an insulating medium." M. Buchholz. March 24th, 1925. (Addition to 198,936.) (Divided application on 7,933/25.) (250,827.)

24,668. "Electric heater element." E. W. Moss (McClary Manufacturing Co.). October 3rd, 1925. (250,833.)

25,074. "Electrical driving arrangements for sewing and other machines." W. Fairweather (Singer Manufacturing Co.). October 8th, 1925. (250,835.)

25,132. "Indicator devices for variable electrical instruments, such as variable condensers, variometers, and tuning units." A. H. Midgley and Auto Sundries, Ltd. October 8th, 1925. (250,836.)

25,460. "Electric flue-gas testing apparatus." G. Sokolow-Winchnevsky. October 12th, 1925. (251,170.)

25,540. "Spacing device for electric accumulators." Soc. de Loye et Touzot. June 15th, 1925. (250,840.)

26,101. "Thermal time-lag relay." Schiele & Bruchsaler-Industriekonzern. October 18th, 1924. (241,587.)

26,354. "Electric welding." British Thomson-Houston Co., Ltd. October 25th, 1924. (241,915.)

27,063. "Electric contact-breaker arms." British Thomson-Houston Co., Ltd. October 30th, 1924. (242,293.)

28,539. "Electric jet-wave commutators and interruptors." J. F. G. P. Hartmann. November 12th, 1925. (251,189.)

28,600. "Dynamo-electric generators." R. Bosch Akt. Ges. February 3rd, 1925. (247,152.)

29,561. "Conductors with artificially increased self-inductance." Dr. U. Meyer. November 22nd, 1924. (243,390.)

29,652. "Spark-gap discharges for use in connection with electric condensers." Dubilier Condenser Co. (1925), Ltd. November 24th, 1924. (243,392.)

29,958. "Current-collecting devices for dynamos." Ruthardt & Co. Ges. November 27th, 1924. (243,753.)

30,368. "Rectifying installations for electric current." Siemens-Schuckertwerke Ges. December 2nd, 1924. (244,092.)

32,434. "Machines for making electric incandescent lamps and similar articles." British Thomson-Houston Co., Ltd. February 21st, 1925. (247,923.)

32,474. "Electrically-driven vacuum cleaners." Soc. de Paris et du Rhone. December 24th, 1924. (245,148.)

1926.

1,288. "Vacuum-producing apparatus of the mercury-vapour jet ejector type." Akt. Ges. Brown, Boveri et Cie. August 10th, 1925. (251,213.)

2,125. "Traffic signals and like light-projectors." British Thomson-Houston Co., Ltd. January 24th, 1925. (246,514.)

3,687. "Alternating-current motors." British Thomson-Houston Co., Ltd. February 9th, 1925. (247,232.)

The

Electrical Review

VOL. XCVIII. JUNE 11, 1926. No. 2,533

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

LIST OF FOREIGN AGENTS (see first page "Official Notices").

Electricity Supply Legislation.

ON June 3rd, after a fortnight's recess, Standing Committee C resumed consideration of the Electricity (Supply) Bill; on the same day there appeared in *The Times* a trenchant criticism of its proposals, signed by nine men in the front rank of the electricity supply industry, which we reproduce elsewhere in this issue. In the main the letter is identical in tenor with the views that we have expressed in these columns—that the cost of the proposals for general standardisation and interconnection would impose an additional burden upon the consumers of electricity, and that the Bill in its present form will not effect the desired result of developing the use of electricity. It is added that its provisions tend to diminish efficiency by unnecessary interference, to introduce further bureaucratic administration without financial responsibility, and to discourage private enterprise.

With the exception of Mr. R. A. Chattock, president I.E.E. and head of the Birmingham Corporation Electricity Department, all the signatories are chairmen or engineers representing important undertakings owned by companies. Mr. Chattock, it will be remembered, set forth his views at much greater length in a manifesto which was published in our issue of April 30th last (p. 719); he then pointed out that if there were just grounds for the complaint that the supply undertakings had not adequately developed the industry, it was rather due to hampering legislation than to the shortcomings of the undertakings, and he cited the delay in granting facilities for extensions of area and the difficulty in obtaining wayleaves for overhead lines as instances which called for remedy. The machinery of the Bill, he considered, would only aggravate the troubles of the existing situation, and he appealed for freedom from interference with undertakings owning big generating stations. His suggestion that the Central Board, as middle-man, should be content with purchasing energy from the existing large power stations and retailing it to outside distributing authorities was an important item of constructive criticism which should receive full consideration; it would go far to appease the opposition of the great power companies and municipal under-

takings, and would obviate the absurdity of buying energy and reselling it to the producers at a price in all probability higher than the purchase price. Mr. Chattock also endorsed our contention that whilst regional interconnection is desirable and economically sound, there is no justification for national interconnecting lines. A further valuable suggestion of his was that in a station of non-standard frequency, additional generating plant of standard frequency could be installed, which would serve the purpose of interconnection whilst sharing in the high economy of the whole station. His statement, as a whole, deserves the most careful attention, and if, as Lt.-Col. Ashley stated at the E.A.W. luncheon last Friday, the Government is prepared to consider any suggested improvement, with a view to obtaining the best possible Bill, it cannot do better than begin with this well-weighed essay.

We have already drawn attention to the important resolution adopted by the I.M.E.A. in special general meeting on May 28th, condemning both the Bill and the Weir Report; in view of the enormous interests represented by this Association and the Parliamentary influence exercised by the municipalities concerned, the resolution is certain to receive the serious attention of the Government. It is not without interest to recall that the whole trouble derives its origin from the legislation of 40 years ago, which was welcomed by the municipalities whose representatives are now, in chorus with the companies, declaiming against the Government's Bill.

One point upon which all, including supporters of the Bill, are agreed is that it is most important to put an end as soon as possible to the uncertainty created by the patchwork legislation of recent years; as Mr. R. P. Sloan remarked at the E.A.W. luncheon, when justifying the attitude of the opponents of the Bill, there has been excessive legislation and constantly recurring uncertainty in the past, and what the industry most needs is a rest, so that it can "get on with the job." The splendid development which has been accomplished in the North-East Coast area is ample vindication of his policy and authority for his right to offer constructive criticism. Mr. W. B. Woodhouse, in a recent article published in the *English Review*, has set forth his considered opinions, many of which are so closely in accord with those which we have expressed in these columns that to quote them would be tautological. We must refer also to the resolution of the Council of the Institution of Electrical Engineers, in concluding that it is abundantly clear that there is a mass of reasoned opposition to the Bill—in its present form—emanating from the whole of the electricity supply industry; a large number of manufacturers and many prominent business men are also opposed to its provisions, and its progress in Committee is marked at every step by detailed arguments of which, unfortunately, we can only find room for an outline. Those who wish to follow this very instructive discussion more closely will find it fully set forth in the "Official Reports" of the proceedings of Standing Committee C, which can be obtained from H.M. Stationery Office at trifling cost, a day or two after each sitting. Provided that the Government is sincere in its expressed willingness to improve the Bill by amendment—and it has already accepted a most important change in the relationship between the Central Electricity Board and the Electricity Commission—we have strong hopes that in the end a really useful measure will be placed on the statute-book. But we take this opportunity of again pointing out that amendment of existing provisions is insufficient; the omissions are no less important, and it is urgently necessary to insert additional clauses drastically changing the situation with regard to wayleaves, the powers of the Postmaster-General, and other obstacles to the extension of distribution networks. **The Bill, as we have previously said, deals only with generation, which represents but a small fraction of the total cost to the consumer; unless it is so framed as to reduce the cost of distribution, it can have but little effect on the ultimate cost, and that fact is the most damning of all—for it means that the Bill, as it stands, fails to effect its most fundamental purpose.**

State Ownership—or Public Control?

WHETHER it be a question of coal mines, electricity supply, transportation, or telephone service, the people who think, and are not, as the Americans say, "dead from the neck up," are unanimously concerned to-day in settling once and for all the vexed question of industrial ownership. The absence of clear thinking on the subject in this country is largely the cause of high taxation and low wages, resulting in strikes, unrest among all classes, and positive misery in some cases.

In our report of the N.E.L.A. convention on another page we quote some striking words by that eminent authority on industrial relationships, Mr. Owen D. Young, who is chairman of the General Electric Co. of America. Mr. Young, who has studied for thirty years the war that has been waged between "public ownership" and "private ownership," sums up his conclusions in no uncertain manner in the speech to which we have referred. He concludes that efficiency and economy of operation are best attained by private ownership, and that a Governmental organisation is an inefficient and uneconomical instrument to do public utility business. Moreover, where there are no economic checks, political expediency tends to lead to extensions as an uneconomic social act rather than as a result of investigations leading to a paying business proposition. The rapid advance of the light and power supply industry in the United States is the envy of every foreign country, and the benefit of such a development is found in the solution of labour problems. If human beings are made the controllers of power instead of the generators their earning power is so much increased as to make it possible to pay them not only a living wage, but a cultural wage.

The high standard of living of all classes in the United States is evident to the most casual observer, and the recent delegation of British Trade Unions saw that the reason lay largely in the extensive use of machinery and labour-saving devices and the initiative displayed in American business organisation. As Mr. Mellon, the Secretary of the Treasury at Washington, has said: "An industry cannot pay high wages even under threats of strikes unless that industry is prosperous. Labour, as well as capital, must think constructively and in harmony. By the investment of capital in labour-saving machinery the production per man is so much increased that increased wages may accompany increased profits." But this means operation on the grand scale, and as Mr. Mellon goes on to say: "Corporations are no longer owned by a small number of individuals. In the United States there are 19 million holders of stock in industrial concerns, many of them persons of small means, who can secure a better and surer return on their money through investment in some useful well-organised company than in any other way."

In this connection we noticed a short time ago that the American Telephone and Telegraph Co., which has 350,000 shareholders on its books with less than a hundred shares each, and over 100,000 holding less than five shares each, has recently issued additional stock which brings its total capital to over a thousand million dollars, and the efficiency of the telephone service in the United States controlled by this huge private enterprise is second to that of none in the world. The article by Mr. R. E. Turnbull on "Customer-Ownership," on p. 890 of this issue is also very pertinent to this subject.

Private initiative is at the foundation of America's prosperity to-day, and although there exist many Government agencies to protect the public against abuses, this is quite a different thing from Government ownership or subsidy.

As we said earlier, our greatest need is for clear thinking. The relative merits of municipal and private ownership of means of transportation should not be confused with the relative technical merits of tramcars and 'buses; nor in a dispute, whether on coal mines or telephones, should we assume that either disputant is entirely in the right. He probably never is. Let us

get it definitely established that an interested employé gives better service than a disinterested one, and that a combination of employers and employés forming an industry must stand or fall on its merits as the result of co-operative service to the public, and we shall have gone far towards reaching a settlement of some of our present-day industrial problems.

Safety First Records.

A REPORT received from the American Museum of Safety bears striking witness to the immense importance of accident prevention; it relates to the records of organised precautions against accident in the works of the United States Steel Corporation over a period of 20 years. The figures are, of course, imposing in their magnitude because of the enormous scope of the company's operations, and the large number of its employés, but after allowing for this factor it cannot be doubted that very great benefit has been derived by both employers and employed from the safety movement.

It is stated, on a statistical basis, that in 20 years 46,000 men have been saved from death or serious injury, and 322,000 from accidents which would have resulted in disablement; a very large saving in money has also been made. These data represent reductions of over 60 per cent. in the former class, and over 80 per cent. in the less serious class of accident. Nearly 10 millions sterling has been spent on measures to promote safety and sanitation in the last 14 years.

It is very significant that accidents due to hazards peculiar to the steel industry, such as hot metal and flame, accounted for less than 5 per cent. of the total, and only 4.9 per cent. were due to machinery; nearly half of the accidents were due to hand labour, which cannot be controlled by mechanical safety appliances. The inference is that, as is shown by our own records of accidents in coal mines, &c., a very large proportion of cases arise from carelessness and inattention, which can only be remedied by educating the workman to protect himself. The adoption of improved methods of lighting, heating, and ventilation also goes a long way to improve the safety records—bad lighting is one of the most potent factors in swelling the list of accidents in workshops.

By spending two millions on accident prevention in 10 years the U.S. Steel Corporation states that it saved three millions, apart from the enormous saving of life and limb.

Trade Difficulties.

IT is no easy task to make new suggestions of practical value regarding the development of our industries while they still lie under the heavy shadow cast by the coal dispute. For years past we have ransacked our own and others' brains in search of solutions of our problems, and pens have run dry setting forth reasons for this, criticisms of that, grounds for hope, and reproofs of pessimism. Committees have investigated and reported, trade and other associations have deliberated and acted, and then, years after, our spokesmen have delivered speeches containing practically the same ideas as we listened to from their predecessors when things were very different. The explanation seems to be that there is really very little new to say in spite of the altered times—practically everything has been said. That, we suppose, is why Mr. A. M. Samuel, M.P., the Parliamentary Secretary to the Department of Overseas Trade, in addressing the Iron and Steel Institute's members last week, reiterated once more the familiar remarks about the need for loyal and efficient labour to work hand in hand with sympathetic managers; for up-to-date equipment and wide-awake selling organisations; for the ingenuity of the technical expert, and the individuality and initiative of the business man; for increased attention to be devoted to research; for overseas agencies to be strengthened and methods of sale attended to; and for engineering firms to be in personal contact with customers abroad through representatives possessing knowledge of our products and armed with authority to act. Yet familiar as these points are, not one of them is of less importance to-day than it has been in the past. However substantial may have been the improvement made as the result of efforts of the past decade, there is still need for something more; probably there always will be. Sometimes we make changes which we genuinely regard as advances; perhaps experience proves them to be otherwise, or some new hand takes command and old ideas are revived and given a chance. Compared with foreign competitors we may or we may not have advanced in our method—such things are very difficult to measure, for we are all constantly changing. Really it is better to get on with the job than to sit talking about it. To be as efficient as possible in every department is what is required, but all such thoughts and ambitions must inevitably drive us back to the question of the cost of production, for we cannot continue to hold existing business or regain lost trade if we indefinitely shelter under the sentimental or the artificial. If the coal dispute is teaching the nation one thing more than another it is the inevitability of the economic truth that if we try to take out of an industry more than it will yield, that industry, like any little shop or other business, must shut down. The position of the general engineering trade, in which, as everybody recognises, the wages of skilled men are deplorably low, affords examples of the way in which some of the biggest concerns are being compelled to adjust their affairs in order to accommodate themselves to the circumstances of these trying years. While things so continue, it is impossible to force higher wages without further crippling the industry. It is unfortunate, and opposed to everybody's wishes that good work should be poorly paid, and no humane or social organisation can feel more deeply on the point than we do, but we believe that the truth regarding economic inevitabilities is becoming more widely recognised and both sides are more familiar with each other's difficulties. Now that the atmosphere is clearer than it was before the general strike, we ought all to be pulling together to bring our suffering industries round, but even these seem to be little better than idle words until the coal trouble is at an end.

Electricity in the Service of Women.

ON Friday last the first annual general meeting of the Electrical Association for Women was held and was followed by a luncheon to which were invited many distinguished men associated with electricity supply. The occasion was described by Alderman Mrs. Hammer (chairman of the Association) as its first official birthday, and we have the greatest pleasure in wishing it many happy returns; for the Association, which has for its object "the promotion of the wider use of electricity in the service of women," has another aspect, no less laudable—the wider use of women in the service of electricity, and from both points of view we heartily welcome it as a permanent and pleasing addition to the great electrical family.

The Association has made remarkably rapid progress during its short life of 18 months and, as Lt.-Col. Ashley observed, it is a very vigorous infant. The same speaker emphasised the fact that selling electricity was as important as generating it, and held that the reason why electricity in the home was a commonplace in the United States and Canada, whilst it was the exception here, was that in America the selling side of the business had been more efficiently conducted. That, as we have often pointed out, is the truth; and we look to the "E. A. W." to put a new face on the matter, by educating women in the art of utilising electricity to lighten labour and brighten the home. As Sir Hugo Hirst remarked, there is great scope for women not only to sell electrical home appliances to women, but also to carry on that continual *service* which is absolutely essential to success, and which will involve a serious course of training, but will ensure them remunerative employment.

The Association is in excellent hands, and will command success by deserving it.

Electricity Supply Undertakings.

The Effect of Load Factor.

(Communicated.)

During the current year two articles have appeared in these pages, analysing from different points of view the statistics of returns of the Electricity Commission for the year ended March 31st, 1923.*

The first article showed that on the average no clear decrease in coal consumption per kWh generated accompanied an increase of output beyond about 10 million kWh per annum, and the second indicated that very little difference in average price could be detected when the output rose above the same figure.

These two pioneer investigations, to which the present author is indebted for inspiration, were, quite naturally, a spur to further effort, and out of the mine of information contained in the statistics referred to, a

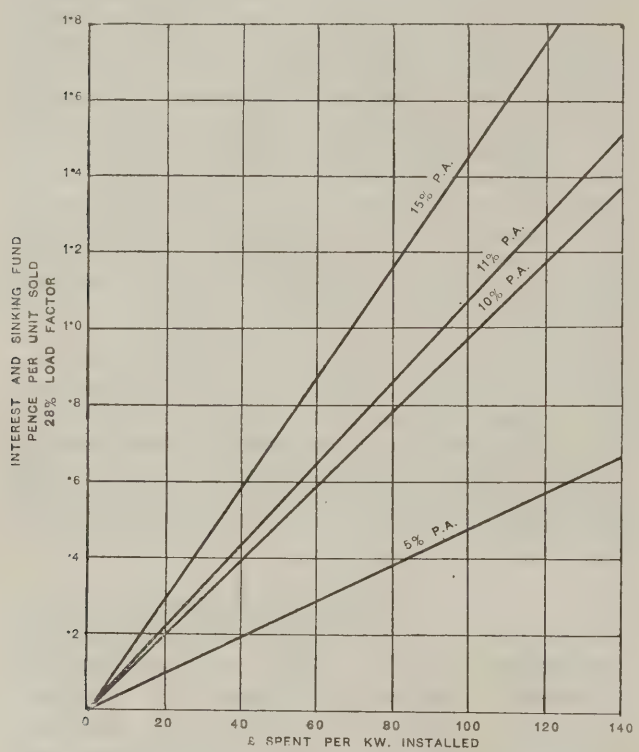

Fig. 1.—Cost of Plant and Capital Charges.

further search for instruction has been made. Following a preliminary investigation, it was decided, if possible, to trace the correlation, if any, of load factor and output as well as load factor and price per unit sold.

Load factor, it is perhaps needless to say, is the ratio of the mean to the maximum load observed upon any producing and/or distributing plant, be it either farm, factory, or electricity undertaking. The importance of cultivating. so far as possible, a full and continuous use of capital already expended, whether in the shape of farming implements, tools, steam, or electrical plant, and at the same time of arranging that all hands are well and effectively engaged, has, wherever prosperity is wooed, been fully recognised for generations. Such full use of capital and labour has for natural reasons some limitations, not the least being that man must sleep, and generally prefers to do so for 8 hours at night time.

Turning now to what may be expected in electricity undertakings, not only is load factor affected by natural causes, but it is found to be further influenced by working hours being normally concentrated within a part of the remaining 16 hours of the day. It must be remembered, too, that. although light, heat, and power are needed for purposes of recreation and pleasure, these agents are not called upon to render service with the same degree of intensity as in the process of creation and production.

* Elec. Rev., Jan. 1st, 1926, p. 5, and Feb. 5th, p. 204.

The cost of producing and distributing electrical power is itself a product of operating and capital costs, and both of these in turn are affected by load factor. As to operation, the lower the load factor the greater becomes the percentage of stand-by losses both in respect of coal and staff. Banking of boilers, radiation from steam pipes and steam plant may be cited as examples of heat losses, and unused attentiveness of skilled operators as an instance of the latter loss. The advent of pulverised fuel will, no doubt, greatly diminish the really serious operating charge of banking, but it is possible to conceive that even this may be done at too great a capital cost.

As to capital costs, these are the real and important burden, and no relief appears in sight. The value of individual savings collected and directed towards safe investment is not less than that indicated by a return of 5 per cent. on the money lent, and it is unwise at present to base any calculation of the return due to capital, in the shape of interest and of redemption, at less than 10 per cent. or 11 per cent., even when such capital is so well secured as in undertakings for the generation and distribution of electricity.

The total sum charged to capital account by electricity supply undertakings coming within the purview of the Electricity Commissioners' report was, up to 1923, approximately £158,000,000, the load factor being on the average about 28 per cent., the units sold 3,762 millions, and the total capacity of the generating plant installed about 3,100,000 kW. From this it is evident that the average cost per kW installed is £51, and the charge on each unit for capital purposes at this l.f. is not less than 0.5 of a penny (see fig. 1).

Since it is imperative to bring down the total cost of the unit, as made up of capital and operating costs, to very little over 0.5 penny, if the country is successfully to secure markets at home and abroad, the magnitude of the task upon which the electricity supply industry is engaged will be realised. It almost looks as if certain of our undertakings (unnamed) may shortly be faced with the necessity of reducing their charges for electricity and, as a consequence, will be faced with sacrifice of capital, or, alternatively, some of the interest thereon.

Reverting to the general question of load factor, one of the greatest obstacles in the way of decreasing the cost of electricity is the interest and sinking fund which must be found for capital lying idle so many hours of each day.

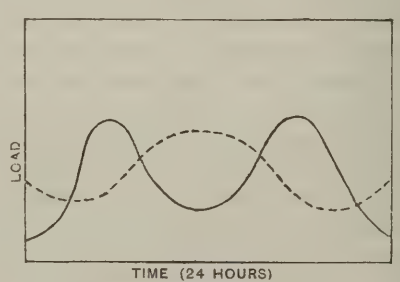

Fig. 2.—Diverse Load Curves.

The mean load, as is also well known, may in one industry be made up of demands varying in time and degree of intensity as compared with that of another industry, and although the same low load factor is found in each case when run separately, an improved result may be anticipated when they are run together. The curves in fig. 2 illustrate this point, the extent of the variation in time and intensity being commonly referred to as the diversity factor.

Turning, then, to the relation between load factor and output under examination, it might be supposed

that as a power station grew in size and the original early lighting supply was followed by power supply,

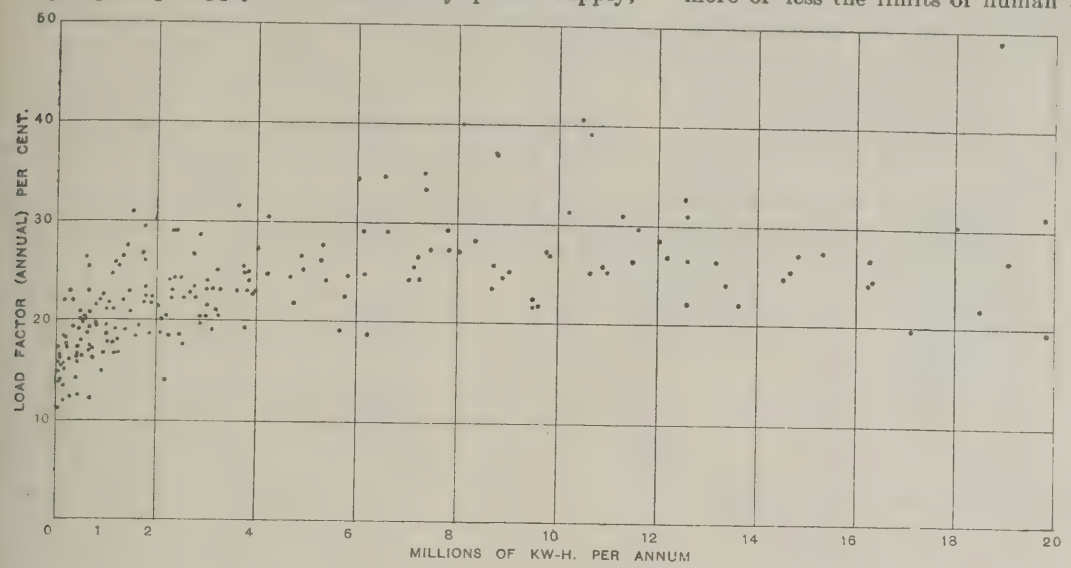

Fig. 3.—Relation between Load-factor and Output.

traction load, and delivery of electricity in bulk, quite a marked increase in load factor would follow. As a matter of fact, as will be seen from fig. 3, continued on fig. 4, no such marked change is to be noted. Certainly, between outputs of 200,000 and 6,000,000 units per annum there is a well defined rise, but for greater outputs ranging from the latter figure to 186,000,000 units, little material change can, in any definite way, be detected. The analysis, it is true, relates only to undertakings run by English local authorities, but it is sufficiently indicative and

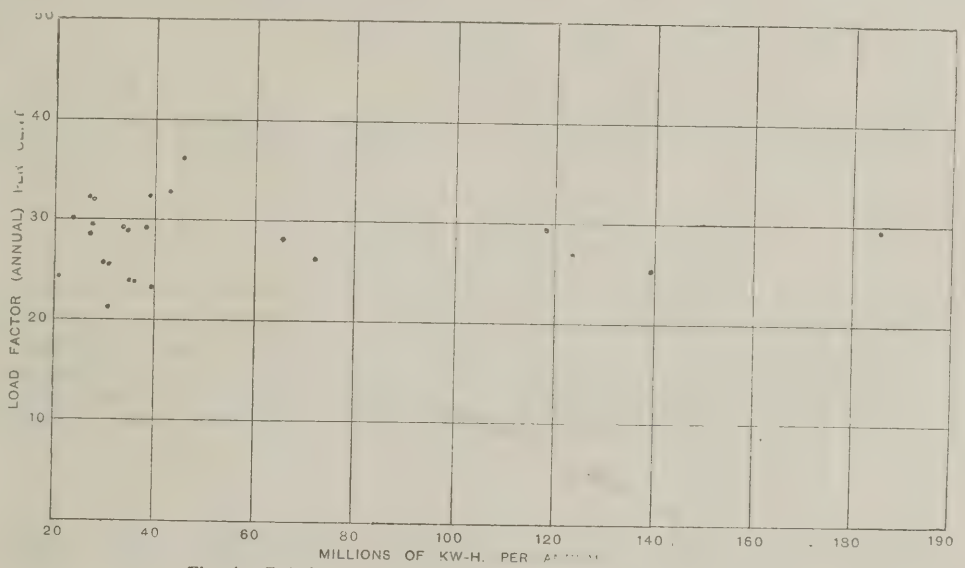

Fig. 4.—Relation between Load-factor and Output (Fig. 3 continued).

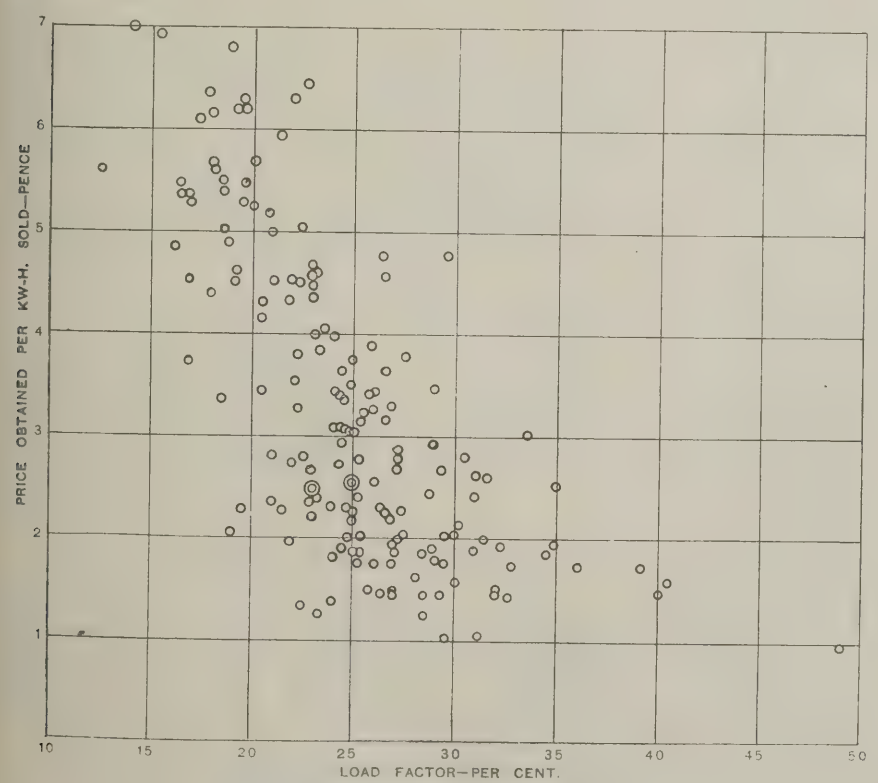

Fig. 5.—Relation of Load-factor to Selling Price.

no doubt reflects the true state of affairs not only of all local authorities, but also of company undertakings. This uniformity is interesting: can it be that there is a somewhat low limit to load factor following more or less the limits of human activity or endurance during a normal period of 24 hours? It would seem that unless hours of toil and amusement—especially the former — are materially extended, a maximum load factor of much over 50 per cent. and a mean of over 30 per cent. need not be expected. Such a high figure as 50 per cent. is to be found occasionally on suburban railway and tramway undertakings, but on the whole it would appear optimistic to expect throughout the length and breadth of the land anything above an average of 30 per cent. The reader must be left to draw his own deductions, but in extracting the figures determining the relationship under review, it should be recorded that no rise in load factor can be attributed positively to an increase in the ratio of electricity supplied for domestic plus public lighting requirements, to electricity supplied for power, traction and bulk supply, when such ratio is anything between 1 to 1 and 1 to 10. Apparently diversity of supply does not influence load factor as greatly as has hitherto been accepted. This is undoubtedly a matter of interest to engineers at the present moment, and raises a question as to the wisdom of effecting interconnection of two or more power stations operating in industrial centres placed in widely-separated parts of the kingdom, and in which it has been shown that, when individually operated, no increase in load factor has occurred with increases in output as made up of the many varieties of supply found in such centres. In other words, if load curves coincide the economies interconnection might introduce will be reduced to those of lessening the amount of spare plant required and some

minor economies in operation. As to the relation of load factor to selling price, as shown in figs. 5 and 6, although there is, as might be expected, great disparity in results, a gradual fall on expected lines does occur in selling price with increase in load factor. The limits of such an investigation must be acknowledged, for the price obtained is, of course, related to the market value, as well as to the cost of production. Yet something seems out of joint when at a 25 per cent. or 27½ per cent. load factor a difference in price of 350 per cent. occurs. This glaring discrepancy has no doubt been recognised and

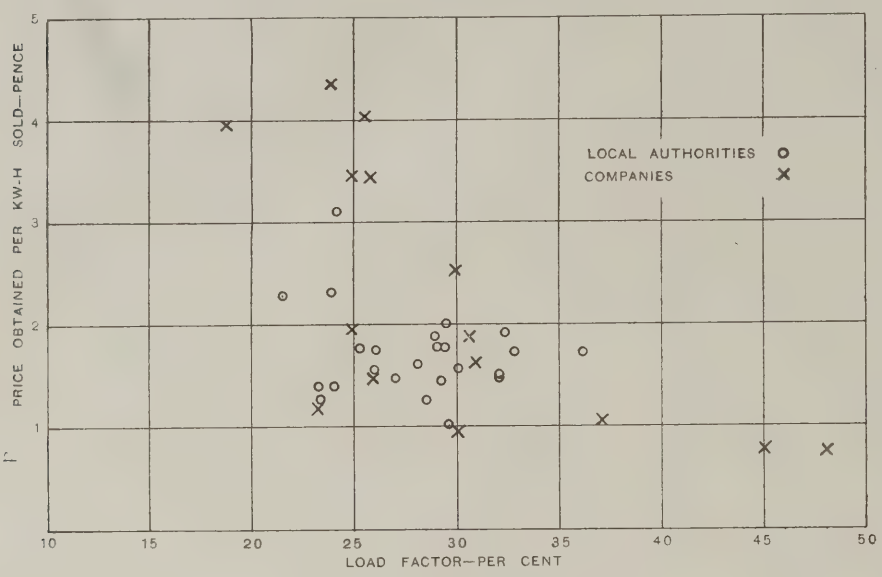

Fig. 6.—Relation of Load-Factor to Selling Price.

will, it is hoped, be provided against in the Government's new Electricity Bill when it becomes law. Undertakings having costs and prices of such "ignoble eminence" should no longer be allowed to scotch progress, and should be assisted, dutifully, to fade away.

Fig. 5 relates to *all* local authorities in England having outputs from quite small figures to nearly 50 million units per annum, but in fig. 6 a comparison of price and load factor has been made between companies and local authorities having outputs ranging from 10 million to 186 million units per annum. The Newcastle-upon-Tyne Electric Supply Company, with its Associated Companies, is not shown; it is singular as having an output of 443 million units per annum. It has the highest load factor—48 per cent.—and the lowest price at .76d. per unit sold; but it will be remembered that it is operating in a particularly favourable field.

The comparison (fig. 6) is singularly interesting as showing how much more consistent are the results of local authorities than those of the companies. The companies do not show up very well, the greatest variation in price on approximately the same load factor being: companies 360 per cent., and the local authorities 220 per cent.

A contemplation of fig. 6 may, it is suggested, prove instructive and helpful to the companies in so far as it may indicate to them the advisability of making some sacrifice in the interests of their consumers. It is perhaps unwise in early and development stages to curtail profit, for the spirit of adventure must be encouraged; but it would seem that, not only in the present state of the public supply of electricity, but also in the greatly extended and far-reaching sphere in which it is intended it shall function in the near future, some sliding scale whereby profits are allocated so as to ensure some definite relationship between dividends on capital and reduction in price should be applied, and would result in nothing but good in the end.

The Insulating Properties of Fused Basalt.

Basalt is a rock of volcanic origin, and is plentiful in many parts of the world, notably in England, France, Germany, and America.

The approximate constitution of basalt is: Silica, 55 per cent.; alumina, 12 per cent.; iron oxide, 22 per cent.; and small quantities of lime, soda, potash, and magnesia.

In its natural state basalt is extremely difficult to work, owing to its great hardness. It can, however, be fused at a temperature of 2,300 deg. F., and can then be cast in moulds of any desired shape. At this stage it resembles black glass and is extremely brittle, but if it is then subjected to a lengthy thermic process it becomes annealed and is restored to its original state.

The dielectric strength of the annealed basalt is 35,000 volts per ¼-in. thickness; it possesses a tensile strength of 18¾ tons per square inch, and withstands a compression stress of 18¼ tons per square inch.

The coefficient of expansion with temperature of basalt is comparable with that of iron; consequently iron parts may be incorporated in the molten basalt before solidification, thus doing away with the need for cementing, with all its disadvantages. This is particularly important for certain forms of switchgear insulators. Metal parts can, if desired, be screwed direct in the basalt.

A further great advantage of basalt is that, should an over-pressure, such as might be caused by lightning, occur, and the arc pierce the insulator, the basalt resolidifies immediately after the passing of the current, and the insulator will remain in service without damage.

Some interesting tests, which bring out this unique property of basalt, were made by the Laboratoire Central d'Electricité, of Paris, on April 13th, 1925 (Test No. 32,202). The tests were made on 10 anchorage insulators, the dimensions of which are shown in the accompanying sketch, fig. 1, with an alternating current having a frequency of 42 cycles.

The tests showed a first flashover at from 27,000 to 30,000 volts, whilst arcing commenced at from 32,000

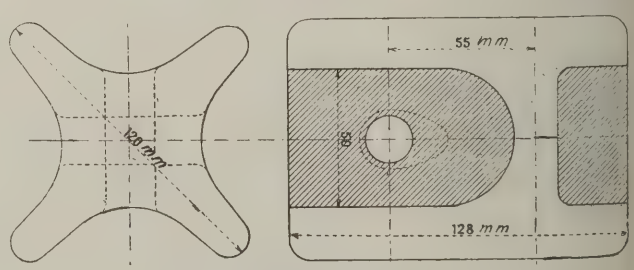

Fig. 1.—Basalt Anchorage Insulator.

to 37,000 volts. Each insulator was then immersed in oil and subjected to four consecutive piercing tests. The e.m.f. was gradually built up till puncture occurred. A second similar test was recommenced immediately after the first piercing, and likewise a third and fourth.

The following is an average result:—

First piercing occurred at		32,000 volts.
Second	ditto	35,000 volts.
Third	ditto	33,000 volts.
Fourth	ditto	33,000 volts.

It will be noticed that it took a greater e.m.f. for the second puncture than the first. This phenomenon occurred in most cases, either between the first and second or the second and third tests.

The chief advantages claimed for fused basalt over existing materials are:—

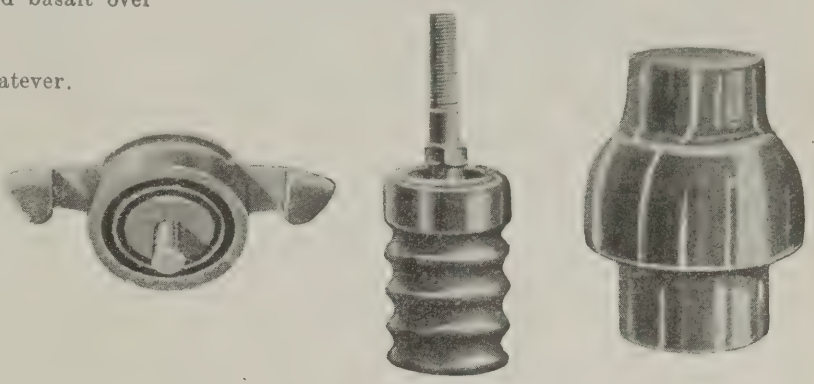
(1) Its high dielectric strength.

(2) It has no hygroscopicity, none whatever.

(3) Its resealing properties when punctured.

(4) The possibility of incorporating stalks, hoods, or any other metal parts in the insulator.

(5) It resists all atmospheric changes, and even acids.



(6) It can be moulded to practically any shape.

(7) It is somewhat cheaper to produce than the porcelain now in common use.

(8) Comparing its strength with any known vitreous material, it possesses a very much greater tensile strength and will withstand a far higher compressive stress.

Fused basalt insulators are at present used extensively on the French electric railways, the P.L.M. alone having 75,000, and it is under test on several railways and tramways in this country.

Figs. 2, 3, and 4 illustrate some of the insulators which have been made from basalt.

Figs. 2, 3 and 4.—Types of Fused Basalt Insulators

The firm dealing with the manufacture of this new insulator in this country is Messrs. R. W. Blackwell and Co., Ltd., to whom we are indebted for the foregoing particulars.

CO_2 Records and their Interpretation.

By CHAS. F. WADE, A.M.I.Mech.E., A.M.I.E.E.

Careful and continuous observation of the percentage of CO_2 in the waste gases from any boiler plant is indispensable if the efficiency is to be maintained at its best figure, but what is equally essential is that the records obtained shall represent as nearly as is practicable what is the true state of affairs and that such records shall be correctly interpreted. The mere blind following of the records obtained from an instrument connected either to the main flue of a battery of boilers or at the back of a single boiler, without special precautions having been taken to ensure that the percentage shown will give a correct indication of the true average CO_2 content will, almost certainly, lead to erroneous conclusions which may have quite a serious effect upon the efficiency of the plant.

When we begin to study the question carefully, it is found that the extraction for analysis of a really representative sample of the gases is not such a simple matter as may appear at first sight, and the larger and wider the boiler becomes, so much more difficult is the problem to be solved. First, let us consider the various influences which will be at work on the type of plant found in the majority of power stations to-day, which will consist of water-tube boilers fitted with mechanical stokers and burning various grades and sizes of coal. In the more recent installations pulverised fuel will be in use, but in this case it will be much easier to obtain true and representative samples of the gases than with solid fuel firing owing to the homogeneous nature of the mixture of fuel and air to begin with. In this article the writer will confine his remarks to the question of solid fuel only.

The first influence upon the CO_2 indication will be the size of the fuel, whether it be mixed or screened, and also how it is fed into the stoker hopper, followed by its distribution over the firegrate. Secondly, the CO_2 percentage will be influenced by the nature of the fuel in regard to its relative percentage of fixed carbon and volatile matter. Next, the width of the grates will exert a considerable influence upon the tendency to stratification of the gases, this last also depending for its extent upon whether the tubes are staggered or otherwise. Air leakages into the gas passages will vary in their effect upon the accuracy of the record obtained by their position, *i.e.*, whether near to the point of sampling or otherwise. Another point to be considered is what the record is required for; if needed for the accurate regulation of fuel and air supplies only, a point for sampling must be selected as near to the firegrate as possible and only far away enough from it to ensure that at the point selected combustion has been completed, but the gases have had the least opportunity of being diluted with air by leakage through the settings. When an indication of the general state of the boiler is desired, including the condition of the brickwork settings, the correct position for the testing point is at the final exit, while a comparison of readings at the two positions referred to will give a good idea as to the extent of any air leakage which may be taking place.

Dealing with the effect which the size of the fuel will have upon the CO_2 record, with the usual arrangement of coal-gate on chain-grate stokers in which the contour of the gate allows greater thickness of fuel at the sides of the grate, provided that the weight of fuel is distributed evenly across the hopper, the CO_2 content of the gases will not vary to any appreciable degree across the gas path, for the additional thickness of fuel at the sides will burn more rapidly than at the centre owing to the effect of the proximity of the incandescent side walls of the arches. If ordinary fixed coal chutes are in use, the result will be that the increased opening at the sides of the coal gate will be neutralised by the decreased weight of the fuel in the hoppers at the sides so that the fires will not only burn out more rapidly, due to the effect of the hot side walls, but also because of the greater air access to the fuel caused by less close packing than at the centre of the grate. There will consequently be a tendency towards greater excess of air at the sides of the furnace than at the centre, this being aggravated by the diversion of the air from the centre and thicker fire, where it is mostly needed, to the sides where the supply should be, if possible, restricted. It does not by any means follow that the excess of air passed through the sides of the fire will mingle with the partly-consumed combustibles from the centre, the probable result being that the stratification of air and gases set up in the fire will be more or less preserved throughout the complete path of the gases through the boiler.

When mixed coals are employed, the sorting-out of the nuts and slack in the hopper will greatly accentuate the stratifying effect described above, and the use of

this class of coal is to be avoided wherever possible. As the grates become wider, the greater will be the difference in gas analysis between the sides and centre and in the middle chamber of a water-tube boiler there may be a variation from 9 per cent. to 15 per cent. of CO_2 in the gases from sides to centre respectively. Of course, every effort should be made to ensure even combustion right across the grate, but even with the best of precautions the likelihood of more or less stratification must not be overlooked when deciding upon the method to be adopted in sampling the gases for analysis. In the case of boilers with staggered tubes stratification will most certainly be reduced, but complete mingling of the gases cannot be relied upon even in such cases and, if the gases and air do become thoroughly mixed by the time they reach the dampers, the final mixture will not have been attained until active combustion has entirely ceased. Under these circumstances it will readily be appreciated that with fires which are not burning evenly across their width, it is quite possible to have a comparatively low CO_2 record at the dampers while the gases actually have an appreciable percentage of CO, CH_4, and H_2 left in them and representing serious waste of heat value of the fuel. Such a state of affairs would exist when the sides of the gas passages give a CO_2 percentage of 5 per cent., and the centre a reading of, say, 15 per cent., the resulting test of the mixture showing 10 per cent. of CO_2.

Where such stratification exists, however carefully we arrange our sampling pipes, whether in the form of a spider in the flue or of a series of pipes of different length, the simple CO_2 recorder or indicator will not necessarily give us a true idea of the conditions of combustion, especially in connection with a large modern unit. Even the inclusion of a CO record does not furnish data for accurate calculation of losses, although this will afford an indication that things are not as they should be. The CO originating from the centre core of the gases will probably be the percentage generated from a considerably smaller amount of coal consumed per hour than that burned at the sides with a much larger percentage of excess air, so that the CO will apparently indicate a more serious shortage of air generally than is actually the case.

The existence of air leakages will be another factor helping to increase the difference of analysis between centre and sides if the inleakage takes place through the side walls, as is usually found.

Two methods are in use for the purpose of obtaining as nearly as possible a true average sample of the gases across their path. One of these methods is to employ a spider pipe with its centre situated halfway between the wall and centre line of the boiler. If the spider has six legs or branches, care must be taken that one diametric pair of branches is vertical, so that in each vertical line the gases will be tapped at two points. If the spider is so set that a pair of its legs are horizontal, the result will be that samples taken at the centre and extreme side of the gas passage will only be half the amount of those extracted from the intermediate positions, so that the sample passed to the recorder will not be a true average of the whole. The other method is to use several horizontal pipes with their open ends in the flue equally spaced across half the width of the boiler, while the other ends are brought into a common pipe leading to the recording instrument. Although the collection of a fair sample of the gases, from which the state of combustion and losses can be calculated accurately, is practically impossible, yet either of the two methods of sampling described will result in the collection of a sample which will be as nearly correct as can be hoped for.

From time to time one reads very definite statements by various writers asserting that either some particular percentage of CO_2 cannot be exceeded without CO becoming manifest or, on the other hand, that quite a high percentage can be obtained without any danger of the presence of CO. One has to realise that the name "coal" is not one indicative of a substance of definite composition and properties, but covers a very great range of combustibles from semi-anthracite to sub-bituminous coals at opposite extremes of the scale, and including an equally wide variation in burning characteristics. In view of this fact, it is easy to see that the writers referred to in all probability have quite accurately stated their own experience, but have carried out their respective investigations with quite different varieties of fuel. Any pronouncement on CO_2 limitations will be of little or no value to other fuel users unless a description and proximate analysis are furnished at the same time. As illustrative of the above facts, some very interesting investigations have been carried out on the Continent with a view to ascertaining what is defined as either the "critical point" or "critical range" of combustion for fuels with differing burning characteristics, or the point at which CO becomes present in sufficient percentage to constitute a serious source of loss. It was found that with coals which are difficult to ignite and burn, *i.e.*, those low in volatile content, a well-marked point was reached at which, although the CO_2 content was low (12 per cent. to 13 per cent.), CO became manifest and increased very rapidly with attempts to reduce air supply or to fire more heavily; with such coals the presence of the least percentage of CO indicates a point where any attempt to increase the CO_2 percentage will be accompanied by a greater loss due to partly unconsumed combustible than the saving effected by reduction of sensible heat loss in excess air. On the other hand, with coals easy of ignition and burning, this critical point is only reached with a much higher CO_2 percentage, and at the same time the point is not at all definite. CO becomes manifest in small percentage, and increases so slowly with increase of CO_2 that the loss due to the unconsumed monoxide is balanced by the saving of heat due to reduced percentage of excess air; consequently there is no definite critical *point*, but there is a critical *range* instead. Once, however, the loss due to unconsumed combustible begins to outweigh the saving due to decreased excess air, the curve of percentage loss begins to rise rapidly. With the bituminous coals, which are those mainly used and which constitute the class having a more or less protracted critical range of combustion, it must be remembered that other effects which lead to loss may be introduced if working to a high percentage of CO_2 is adopted. The production of black smoke is the principal trouble which is likely to be experienced with the accompanying trouble of the heat insulating layer of true soot on various portions of the heating surface; this, unlike flue dust which lodges only on the upper surfaces of tubes, adheres to every portion of the surfaces with which it comes in contact. In the comparatively moderately-sized plants, where a battery of boilers is served by a common main flue and chimney, the localisation of the cause of black smoke is not always easy, and some sort of indicator is needed for picking out the offending boiler in a battery, the most simple

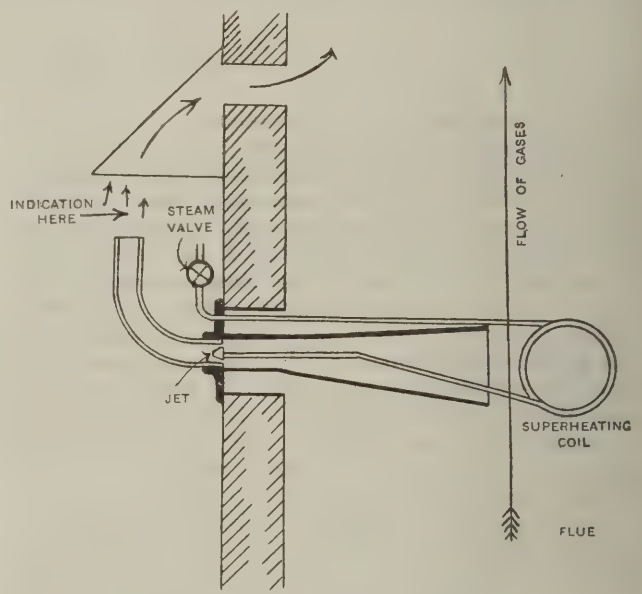


Fig. 1.—Carr's Combustion Indicator.

and effective device of this kind known to the writer being shown in the sketch. This appliance is known as Carr's combustion indicator, and consists of a small jet of superheated steam or compressed air which extracts a small sample of the gases from the middle chamber or other suitable point in the circuit, and discharges it either into the boiler ashpit, where it can readily be seen, or else by means of a suitable hood whence it came. When smoke is being produced, it is made instantly visible, the ideal conditions to work for being the least suspicion of visible smoke which indicates the nearest practical approach to perfect conditions of combustion in the particular furnace to which it is attached. Incidentally, this device does not appear to be nearly as well-known as it deserves, and it has given the most satisfactory results in the writer's hands, being easily comprehended by the most unintelligent of firemen.

From what has been said, it seems that in the case of large boiler units at least, two combustion records should be kept, the first being taken at the middle chamber and preferably including both CO_2 and CO charts for the observation and control of air and fuel regulation. while a plain CO_2 recorder installed at the point of gas exit will, by comparison with the first record, furnish evidence as to the physical state of the boiler settings with regard to air leakage and overall condition.

Bearing in mind the variation in critical point or range of combustion with various classes of coals, it is essential that the economical limit of maximum CO_2 percentage shall be carefully determined before setting any particular figure to be aimed at by the boiler-house staff, and this maximum will be somewhat variable if the coal used is not all of one class. In order to set about this, a close approximation to the carbon and hydrogen contents of the fuel used is necessary and is preferably obtained by regular ultimate analysis for these constituent elements, and this will provide the necessary data, together with the waste gas analyses and temperatures, to calculate accurately the percentage chimney loss under any conditions. It is also necessary that a boiler shall be put into as nearly perfect a condition as is possible with regard to cleanliness, baffling, and absence of air leakage, so that the limits it is desired to ascertain will be arrived at accurately when the particular coal under examination is used under the boiler. The actual calculations involved will not be described here, but once the ultimate analysis is known, a chart should be prepared showing the heat loss per pound of fuel under various conditions of CO_2 and temperature in the waste gases, and also a chart showing the additional loss for varying percentages of CO for the same coal. The test is made by gradually decreasing the amount of air admitted to the fires per pound of fuel burned and taking careful note of the CO_2, CO, and temperature of the waste gases, from which data subsequent calculation will determine the most economical CO_2 percentage and the highest permissible CO with minimum loss in the gases.

Since high percentage CO_2 is accompanied by high furnace temperatures, the permissible maximum will be largely influenced by the fusion temperature of the ash. With ash of a low fusing temperature, usually associated with the ferruginous ash of reddish or brown colour, high furnace temperature will cause ash fusion, which. in its turn, causes obstruction in the firegrate air spaces and results in incomplete combustion, while the light-coloured ashes are of much higher fusing point and permit of higher furnace temperature and more efficient conditions of combustion and radiant heat transmission. Incidentally, it is often a paying proposition to introduce steam jets beneath the firegrates when coal containing "low fusing" ash is obtainable at a price which makes the additional steam consumption worth while, as this will prevent the formation of masses of fluid clinker and enable full furnace temperature to be developed without risk of losses through incomplete combustion. The steam will also preserve the life of the firebars enormously, this being proved by the large number of patent steam-blown hand-fired grates which have not required firebar renewals for periods of years, although high-furnace temperature is one of the reasons for the economy in use of this class of furnace.

In conclusion, it may be as well to mention that CO_2 and CO records by themselves do not furnish all information as to losses which may be taking place, but only the degree of efficiency with which the fuel actually burned to the gases mentioned is used. Short circuiting of gases, excessive convection losses, blowing off. excessive blowing down, poor heat transmission due to dirty heating surfaces, combustible in the ash heap, &c., are all important sources of loss which the gas analysis tells us nothing about.

Concerning High-Tension Batteries for Radio Sets.

How to obtain Efficiency with Economy.

By PAUL D. TYERS.

Probably one of the greatest deterrents to the universal popularity of broadcast reception is the frequent necessity of replacing the high-tension battery. The high-tension difficulty has been partly solved by the marketing of various devices for deriving the high-tension supply from public electric light mains. Most of these devices, however, usually provide only one or two voltages, and are, therefore, not so readily adapted as the ordinary type of high-tension battery. Moreover, the alternating-current models particularly are apt to be expensive, and, accordingly, a vast majority of listeners still employ the more normal high-tension battery.

Probably few users and retailers realise the importance of employing a high-tension battery suitable for the particular set with which it is to be used. The power valve, which has been developed and popularised during the last two or three years, necessitates a greater demand for current upon the high-tension battery, and it is a well-known fact that the smaller the rate of discharge the longer is the probable life of the high-tension battery. Batteries are now made in two or three capacities, the larger-sized cells probably having a life of two or three times that of the smaller sizes for any given discharge.

It is interesting to note that one well-known battery manufacturer is now indicating on the batteries the type of sets or valves for which they are really suitable, and the dealer would do well to point out this fact to his purchasers. The man with a seven- or eight-valve set, including perhaps two power amplifying valves, will receive little satisfaction from employing the ordinary small type of high-tension battery, although, no doubt, thousands are using them. If the dealer points out the benefits which will be derived from purchasing the larger type of cell he will do much to gain the confidence of his customer. Although it means that he will not have the opportunity of replacing the high-tension battery for a much longer period, he is not only

selling a much higher-priced article, but he is also giving more satisfaction, which is a point that should not be overlooked.

Nothing can be more deceptive than many of the cheap foreign high-tension batteries. It is not meant that foreign batteries as a whole are inefficient, but out of quite a large number tested by the writer they have been found to be inefficient when compared with our own productions. Although the cheaper types of battery may be more attractive from a selling point of view, their use appears to be false economy, since they do not last as long as the better class of battery, and several which the writer has tested have given trouble due to faulty cells developing.

Another factor very materially determining the life of a high-tension battery is that of insulation, and steps should be taken to guard against loss due to leakage. High-tension batteries should on no account be kept in damp places, while it is also important that they should not be exposed to too high a temperature. It is also a very wise policy to disconnect the high-tension battery from the receiver when not in use, as this not only eliminates the possibility of leakage in the set, or by wires connected to it, but also minimises the chances of the inter-valve transformers breaking down.

Efficiency in dry-battery high-tension supply can briefly be summarised as follows: Use a battery which is composed of cells sufficiently large to supply sufficient anode current without exceeding the useful discharge rate consistent with capacity. Use cells of good quality only. Maintain adequate insulation of the battery. Disconnect the battery when not in use.

The Electricity Policy of the French Government.

The Functions of the Electrical Committee.

By THEODORE RICH.

At the present moment, after our Government has forced through the second reading of the Electricity Bill with the argument that this country is behind the rest of the world, it is worth while to study the laws and policy of some Governments in countries where the conditions are not too far removed from those obtaining in our own land.

France is one of those countries where the climatic and social conditions do not differ very materially from ours, but it appears that the gross consumption of electrical energy per head per year from public supply is sensibly greater than in this country. If one can judge by the French technical Press, by the published laws and regulations, and by opinions expressed by men of standing, then apart from factors which hardly exist in our country, such as millions of horse power which can be developed from water flow, France, at the present day, cannot to any material extent be said to owe her position to the adoption in the past of any drastic policy such as that recommended to us by our Government.

The system adopted has worked very well; it has undoubtedly produced results. It is not the product of any political "stunt" legislation, and successive governments of different political complexions have supported it and improved it from time to time. The public as a whole realises that while the cost of many commodities has gone up about five times since August, 1914, the cost of electricity has gone up very much less, and is, therefore, satisfied. There are certain features connected with the densely populated Paris area, and certain arrangements which follow naturally from the development of water power without reservoirs of capacity equivalent to many weeks' power supply, which have certain similarities to some proposals in "The Bill," but they are not to the same extent applicable to our conditions.

France is still mainly agricultural in character, and despite that obstacle she owes her electrical progress very largely to factors that our Bill makes no serious attempt to touch upon—namely, the comparatively simple and inexpensive procedure for the obtaining of concessions, and the facilities for distribution at low capital cost. If one can judge from interviews with men of prominence in France, the absurdity and unfairness of contrasting California, Sweden, or Shanghai with England as a whole seem to be perfectly manifest; and the extraordinary way in which evidence was selected for the Weir Report, which report has been closely examined in some quarters on the other side, is not likely to improve the reputation of the British Government or of the parties responsible for it.

Common-sense Laws and Regulations.

The present policy in France is to a large extent based on the law of 1906, which has been modified somewhat to suit the conditions obtaining since 1914. Under this law an Electrical Committee was formed to advise the Ministry of Public Works, and in certain circumstances other Ministries, regarding practically all fundamental matters relating to electricity supply; its composition was such that political party influences were minimised, and Ministers soon realised that in accepting the advice of the Committee, they were relieving themselves of responsibilities of a highly technical and often very complicated character, and that in doing so in accordance with the spirit of the law of 1906, they were protecting themselves to a material extent against trumped-up attacks in Parliament regarding their actions.

For many years past, not merely in the case of electricity, the French Government has had sufficient far-sightedness to realise that if someone comes forward with a project for the provision of public services, the benefit to the community resulting from such services is likely to be considerable. Therefore, in legislation and in concession conditions, instead of putting in drastic penalties and pin-pricking obstacles, facilities are given so that in suitable cases the undertaking can be declared a "Public Utility;" it can then enjoy certain privileges analogous in some directions to those enjoyed by the Government Public Works Department itself. It goes so far, when so recommended by the Electrical Committee, where two public utilities are concerned, even if one is the Government Postal Telephone Service and the other is a mere money-making power company, that even if the former has been first on the field, it must give way if the interest of the public makes it desirable to do so.

When considering the legislative and administrative situation in France regarding electricity supply matters, one must remember that admirable as the arrangements are in many respects, owing to the differences in the Constitution, differences in local government (for instance, the existence of prefectoral supervision), and the fact that nearly all the electricity supply in France is in the hands of private enterprise, it would be undesirable, if not impracticable, to adopt the French system in our country *en bloc*. There are, however, numerous points of practical value, and subject to modifications and safeguards there is much in the French system worthy of adoption.

The Electrical Committee.

The Electrical Committee forms a sort of Parliament, Advisory Board, and Court of Technical Appeal for electricity supply and power matters. There are thirty

members, half nominated by representatives of the Ministries of Public Works, Interior, Commerce, Industry, Posts and Telegraphs, War, and Agriculture. Fifteen members are drawn from various representative professional and business bodies concerned with electrical matters, being as a matter of form nominated by ministerial decree on the recommendation of the Ministries of Public Works, Commerce, Industry, Posts and Telegraphs. As a matter of fact, as the Government genuinely desires to be on friendly terms with, and to co-operate with, the leading bodies in the electrical industries, several such bodies are invited to send forward a list of members of the executive in order of recommendation, and the required number from each body is almost invariably selected from the top of the list.

The secretary and assistant secretaries are chosen from the engineering staff of the Ministry of Public Works, men who have had a high-class engineering training at the College of the "Ponts et Chaussées" with practical experience to follow. At present the president of the Committee is M. de la Brosse, Inspector-General of the "Ponts et Chaussées," with vice-president M. Legouez, who is president of the Union of Electrical Societies. Among the members are to be found an Inspector-General of Road Services; the Head of the Roads, Lighting, and Sanitary Services of the City of Paris; the chief engineer of the Midi Railway Co.; a representative of the Union of Electricity Distributors; the general manager of the Lyons Gas and Electricity Co.; a General-in-Command of the Transport Services of the Army; a Colonel-in-Charge of the Electrical Branch of the French sappers; and representatives of electrical manufacturers and various power and tramway undertakings.

The Committee gives its advice in numerous cases laid down by the law, and has to assist public departments when required; some of its functions are analogous to those of our Electricity Commissioners, but it has nothing like the same compulsory powers; for instance, it does not claim the right to veto the extension of plant in any steam station, neither has it any right whatever to meddle in the selection of plant for private installations. The members of the Committee as such are unpaid, its offices are unpretentious, and the cost of electricity control to the different supply authorities is relatively small. In France Government officials are usually expected to give their services to other departments without extra pay, and apparently membership of the Committee is looked upon as an honour like membership of the Councils of some of our leading institutions. The Electrical Committee does not proclaim that electricity supply in France is so badly conducted that the Government is forced to make a huge monopoly of it, and the policy of the members is to assist rather than to dictate.

In the twenty years of its existence, the Committee has functioned in a harmonious manner. Those who find that certain regulations and rules are acting harshly and are tending to clog progress can appeal to the Committee usually through the Ministry of Public Works without a lot of legal expenses. Details of accidents which take place have to be reported to it, and in suitable cases it recommends prosecutions for infractions of regulations.

Other Committees.

Although strictly speaking without statutory powers, so that the Ministries concerned are not compelled to consult them, certain other committees have been formed, among them one connected with the distribution of electrical energy made up of twelve representatives from different Ministries, twelve from various branches of the electrical industry and professions, and twelve from Chambers of Commerce and similar bodies. There are also two committees relating to water power, one dealing with its scientific study, and the other with matters relating to its utilisation.

The N.E.L.A. Convention at Atlantic City.

By PHEIDIPPIDES.

The forty-ninth convention of the National Electric Light Association, held in Atlantic City, N.J., May 17th to 21st, proved to be a record gathering. Close on ten thousand delegates and friends attended from all parts of the United States to take part in the technical and commercial discussions of the numerous committees and to hear important speeches from men prominent in the electrical industry and political life of the United States. Even this immense gathering, however, was no very serious tax on Atlantic City, with its huge hotels and spacious piers. The headquarters for the meetings and social events was the main hall on the Million Dollar Pier, which accommodated the entire convention, whether as an auditorium during the day time or as a ball-room in the evening. The covered part of the pier also provided, in addition, a space of a hundred thousand square feet into which upwards of three hundred exhibitors had collected a remarkable display of electrical apparatus and machinery.

The guests were received on the evening of May 17th by the President of the Association and Mrs. Davidson. After the reception there followed a concert by the famous Vincent Lopez Orchestra from New York, and dancing continued to a late hour.

On the Tuesday morning the first general session was held under the chairmanship of President J. E. Davidson; the principal speakers were Mr. M. S. Sloan, of the Brooklyn Edison Company, and Mr. Owen D. Young, chairman of the Board of the General Electric Co. and Radio Corporation. It will be recalled that Mr. Young co-operated with Vice-President Charles P. Dawes in the drafting of the Dawes plan for the settlement of war reparations. In his speech, Mr. Young made an earnest plea for the private ownership of public utilities. He said that a quarter of a century of close observation of Government operation of utilities had convinced him that its efficiency was markedly less than that of the private companies. "I have seen too many instances," Mr. Young said, "where no one but the Government would have dared to give such inadequate and inefficient service." He showed how political influences interfered with the progress of electrical development, and called for support in the full adaptation of new inventions and new engineering, not only in the physical plants, but also in the social sciences, in order to attain the goal of maximum public service.

Public ownership and public relations were the chief points under discussion at this session, and the President's address was a stirring call to arms, that the industry might continue work of the character which had given it its present happy position. Though the light and power industry had lowered costs, increased standards of service, and established an enviable credit standing, it was still necessary to carry out the responsibilities of utilities in order to give good service.

In a vigorous and telling address, Mr. M. S. Sloan directed attention to public relations. Public opinion, he said, was now favourable to the industry, and this was due to the efficient work which had been done by the Association on this subject. He pleaded, however, for continued executive support, as the problem was not completely solved, and co-operation between public utility information bureaus was as necessary now as ever it was. Other speakers were Messrs. R. H. Ballard,

Southern Californian Edison Co., and W. C. L. Eglin, Philadelphia Electric Co.

On the third day of the Convention the Honourable Andrew Mellon, Secretary, U.S. Treasury, delivered a broadcast address, in which he showed that mass production, inventive genius, elimination of class hatred, and recognition by capital and labour that only a prosperous industry could pay high wages, were among the principal factors which had contributed to the high level of industrial development and the prosperity obtaining among all classes in the United States. "It is," said he, "organised industry that has brought about the present unprecedented development in this country. America has adjusted herself to the economic laws of the new industrial era, and has evolved an industrial organisation which can maintain itself, not only because it is efficient, but because it is bringing about a greater diffusion of prosperity among all classes."

The Honourable James John Davis, Secretary, U.S. Department of Labour, made a stirring appeal to the Convention to promote better lighting and more cheerful surroundings in factories so that workmen might be saved from accidents, goods saved from spoiling, and production increased. When science discovered that, by means of electricity, it was able to flood our homes and shops and streets with a light as brilliant as that of the sun, creation widened to man's view. "No wonder," said Mr. Davis, "that Diogenes failed in his quest for an honest man—his lantern was much too dim. Light has a strong tendency to make men honest, and the flooding of our streets and shops with electric light does more to discourage the burglar than all the police in the world."

Mr. G. E. Creed, chairman of the Water-Power Development Committee, said that twenty-three new hydro-electric plants put into operation during 1925 had increased the hydro-electric service of the United States by 2,352,537 kilowatt-hours, bringing the total up to 22,322,000,000 kilowatt-hours. Steam plants, he said, increased that to over 65,800 million kilowatt-hours, an increase of 11.5 per cent. in one year.

On the 19th, Mr. Thomas A. Edison visited the Convention, and during the day inspected the various exhibits. At the dinner in the evening one speaker remarked that the electrical industry was still interesting to the man who started it, and the remark evoked such continued applause that Edison, who has consistently refused to broadcast, was compelled to say a few words into the microphone. At the evening session the Charles A. Coffin Medal was awarded to Mr. Samuel Insull, president of the Commonwealth Edison Co., of Chicago, and other prizes ranging in value up to $2,500, for accomplishments resulting in higher standards of lighting, were awarded to various organisations.

Mr. Guy E. Tripp, chairman of the Westinghouse Electrical & Manufacturing Co., addressing a general session of the Convention on the 20th, dealt specifically with industrial electrification and the value of electricity to the farmer, who in America at the present time is having a struggle against the costs of commodities. He asserted that only by decentralisation of American industries, combined with an increased application of electric power, could the farmer be lifted to a plane of profitable existence. He found occasion for considerable optimism in the fact that such decentralisation was proceeding on an increased scale. The chief obstacle to the electrification of farms, Mr. Tripp said, was the high cost of bringing electric service to them. It usually did not pay to take care of the relatively small demand of a few scattered farms, but it frequently did pay to do these things to serve an industry; and, when once a service connection was made and a line was built, neighbouring farms could be supplied with electric power at reasonable cost. Hence, as rural industries developed, more and more farms would be electrified.

On Friday, May 21st, the closing day of the Convention, the principal speaker was Mr. William L. Green, president of the American Federation of Labour at Washington. He pointed out that production due largely to the application of electricity had increased by between 25 and 50 per cent. during the past twenty-five years. "Electrically driven machinery has lightened the burden of employment," he said, "and relieved the workers of the drudgery and hardship of human toil. Life has been made more tolerable, living conditions improved, and the workers have been permitted to enjoy the blessings and benefits of modern life."

Election of officers for the ensuing year brought the Convention to a close, but special mention should be made of the high order of excellence of the gigantic electrical exhibition held in conjunction with the Convention. We have already indicated the size of the exhibition, which was one of the greatest displays of electrical devices ever organised. It was a third larger than the one arranged by the N.E.L.A. two years ago, and would have contained still another 100 exhibits if space had permitted. The British public is perhaps inclined to look a little askance at electrical domestic appliances, but the large number of electrical washing machines and refrigerators shown at Atlantic City—there were over a dozen different makes of the latter on view—show that such conditions do not hold in the United States.

A curious new device shown in the development stage was a machine for "seeing" smoke, which can be utilised to give warning of fire, and to control lighthouses during foggy weather.

A good many "organisation" exhibits were packed with valuable suggestions for the electrical education of the public. The National Electric Light Association itself, for example, had one illustrating the advance of super-power development, and another showing the evils of defective lighting in the home. At numerous points in the exhibition moving pictures were employed to show how the device worked, and one exhibitor had actually a talking picture which created considerable interest in the operation of a particular domestic refrigerator. We noticed that the salesman in the case was as bright and interesting at the end of the exhibition, after having told his tale perfectly some hundreds of times, as he was on the opening day. This cannot always be said of the exhibition salesman.

Another centre of attraction throughout the exhibition was a life-size wax figure of Venus, which visitors were invited to paint with light through the operation of a score of switches controlling a large number of colour combinations. A prize was given for the attempt most nearly in agreement with the opinion of a committee of lighting experts.

Throughout the period of the Convention a six-page newspaper was furnished gratuitously to all delegates by the *Electrical World*, with lists of members, and daily programmes of business and social functions, and interspersed with incidental and humorous Convention news.

In every possible way the Convention this year was an outstanding success. After 24 hours of storm encountered by the early arrivals, the weather was delightful; the exhibition was of outstanding interest, the social functions were well organised and fully enjoyed, and above all the business sessions were well attended and appreciated by the great majority of the ten thousand delegates. The officials and voluntary workers of the National Electric Light Association are to be congratulated on achieving a masterpiece of organisation.

Maintaining the Supply at Manchester.—The Manchester Electricity Supply Department reports that during the general strike the whole of the men employed by the Department remained at work, with the exception of nine bricklayers employed in the Building Section. Electricity supplies to the Department's consumers were maintained continuously without interruption. The failure to run a tramway service was not in any way attributable to the Electricity Department. The current was kept on the overhead lines continuously throughout the night of May 3rd and all day on May 4th, until a communication was received from the Tramways Department announcing that there was no immediate prospect of resuming the service. The lines were then made "dead," but everything was kept in readiness for resuming the supply at the request of the tramway authorities. The Electricity Committee, at a meeting on May 19th, adopted the following resolution:—"That this Committee desires to place on record its recognition of loyalty to the public service of its employés during the period of the general strike."

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Our Trade Names Supplement.—Along with the issue of the ELECTRICAL REVIEW for June 25th we shall publish the first of a series of four Quarterly Supplements of Electrical Trade Names. These will contain the names and addresses of manufacturers and suppliers of a large number of electrical products and materials which bear special Trade Names. Each Supplement will be distributed free to every one of our 13,000 readers at Home and abroad, and will enable them to get into direct touch with the maker of any article included in the List.

Proposed Amendments to Company Law.—The Committee appointed by the Board of Trade in January last year to consider and report what alterations were desirable in the Companies Acts has made a number of recommendations. Among these are proposals that the "hawking" of shares from house to house should be prohibited, and that certain particulars should be compulsorily furnished by those who offer shares by means of circulars. It is also suggested that the amount of discount upon new share issues should be limited to 10 per cent. of the market value of similar existing shares; and that undischarged bankrupts should only become directors of companies by permission of the Court. Other matters with which the report deals are the remission of stamp duty in the reconstruction of a company involving the transfer of property to a new company; the keeping of proper accounts; companies outside Great Britain; and the issue of redeemable preference shares.

Local Exhibition.—WEST HAM.—The chief engineer and manager of the municipal electricity undertaking (Mr. F. W. Purse) informs us that an electrical exhibition is being held at the Town Hall during the whole of next week.

New Private Businesses.—The following new businesses have recently been registered under the Business Names Act:—

Paddington Electrical Supplies, electrical and radio engineers, 327, Edgware Road, W.2.

Eastern Wireless Battery Supply, radio goods, 147, Roman Road, Bow, E.3.

C. D. Appleton & Co., electrical factors, 11, Marsden Square, Manchester.

West of England Radio, radio dealers, 99, Newport Road, Barnstaple.

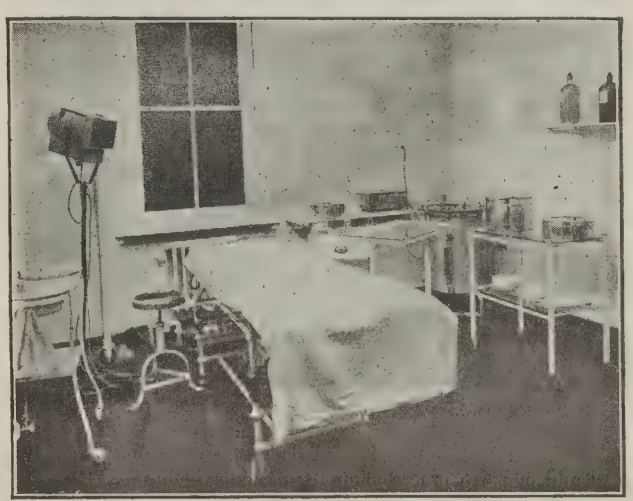
Phœnix Electrical Co., electrical and radio supplies, contracting and heating, Picturedrome Buildings, Water Street, Radcliffe, Manchester.

F. Westbrook & Co., electrical and radio engineers, 14, Cross Street, St. Leonards-on-Sea.

The British Electrode Co., welders and manufacturers of welding electrodes, Deptford Park, S.E.8.

New Metro-Vick Signal Company.—The Metropolitan-Vickers Electrical Co., Ltd., has recently entered into arrangements for the sole manufacturing rights, for Great Britain and the Dominions, of the General Railway and Signal Company, of Rochester, U.S.A., and accordingly a new company, under the title of Metropolitan-Vickers-G.R.S., Ltd., has been registered. The new company is preparing to manufacture at the Metropolitan-Vickers works at Trafford Park all types of railway signalling apparatus, including the all-electric interlocking system, embodying the use of the well-known "dynamic indication" principle, of which, it is claimed, the General Railway Signal Company was the pioneer, its experience in the art of signalling having extended over thirty years. The company will also specialise in automatic train control of the intermittent inductive auto-manual type and the continuous inductive type; the absolute permissive block system for signalling on single lines; low-voltage point-operating machines for remote locations; car retarders for gravity marshalling yards, and many other systems and appliances.—*Modern Transport.*

Cheap Power in New Zealand.—A company formed for the manufacture of special steels is starting operations, says a message from Christchurch, New Zealand. The Dunedin municipal authorities are supplying electric power at one-third of the price paid in Sheffield. The company will manufacture all those parts of machinery which formerly were forged and now are cast by a new process. It will probably supply most of the requirements of the New Zealand railways and other big businesses, to the exclusion of British manufacturers.—*Financial Times.*



United States Import Prohibition.—According to the *Board of Trade Journal*, the United States authorities have prohibited the importation of synthetic phenolic resin of Form C and articles made of this, wholly or partly, on the ground that certain articles made of synthetic phenolic resin have been imported and sold in infringement of the Bakelite Corporation's patent rights.

British Radio Exhibit in Jugo-Slavia.—*Commerce Reports*, dealing with the Zagreb (Jugo-Slavia) Spring Fair, says that for the first time there was a complete radio exhibit and great interest was shown in this section in view of the projected erection of a broadcasting station in the district. The best display was from England; others, in order of their importance, were from France, Switzerland, Italy, Austria and Germany.

French Customs Decisions.—The *Board of Trade Journal* reports that the French Customs authorities have decided that electro-medical lamps for producing ultra-violet rays are to be classed as electro-technical apparatus (No. 524 *bis*). Incandescent lamps or mercury-vapour lamps, not mounted, are dutiable separately as such. Electric transformers are also dutiable separately. Loud-speakers ("Selectron" and the like) for gramophones and wireless are classed under "Accessories and detached parts of gramophones" (No. 604).

Electrical Development in the United States.—Some up-to-date statistics relating to electricity supply in the United States were given by Mr. J. E. Davidson, president of the National Electric Light Association, at that body's recent annual convention. He said that at December 31st, 1925, there were 13,460,000 wired homes, 2,750,000 commercial customers, and 675,000 industrial consumers. The total investment in the electricity supply industry was $7,350,000,000, and the gross income for 1925 was $1,425,000,000. The total number of customer-owners was 1,322,367, and they held 9,775,572 shares. The amount of energy generated during 1925 was 60,250,000,000 kWh. The population of the United States was given as 116,000,000, and Mr. Davidson stated that electric motors throughout the country were doing every day as much work as could be accomplished by 170,000,000 men. Electrical service cost less to-day than it did at the beginning of the war. The number of domestic consumers of the electric light and power companies had doubled in the last six years, but there were still more than 10,000,000 homes waiting for electrical service.

Operating Theatre Lighting.—The operating theatre of the Rugby Infirmary has recently been equipped with a "B.T.-H." lighting installation. The operating table is lighted by means of six "Glassteel" diffusers, each of which contains a 300-W "Mazda" daylight gasfilled lamp. The units are arranged in such a manner as to concentrate their

The Rugby Infirmary Operating Theatre.

light upon the table, which is illuminated to an intensity of about 80 foot-candles. The excellent effect can be gauged from the accompanying reproduction of a photograph taken at night solely by the light of the diffusers. The "Glassteel" unit consists of a "Mazdalux" reflector fitted with a glass diffuser which completely conceals the lamp and eliminates glare and deep shadows, producing the conditions which are essential in such an application as an operating theatre.

Brazilian Railway Electrification.—The May *Monthly Review* of the Bank of London and South America reports that the Government of the State of Sao Paulo (Brazil) has appointed Mr. A. C. Cardoso, a Brazilian engineer, to study the most up-to-date railway electrification schemes in the United States and Europe. Upon his return Mr. Cardoso will be in charge of the electrification of the lines of the Sorocabana Railway. His report, together with specifications, &c., will be delivered not later than August next to enable the railway to call for tenders forthwith for the execution of the electrification works. In order to assist firms who may be interested in the scheme, several publications have been issued giving full technical data and the broad lines on which the works will be carried out. Copies of these have been sent to leading electrical concerns and institutions in Great Britain, Germany, the United States, Switzerland, and Sweden, including the British Engineers' Association. The electrification of the Paulista Railway continues rapidly. It is intended to inaugurate a further extension of electric line from the Tatú station to Rio Claro before the end of 1926. The Rio Claro-Ityrapina section will then be taken in hand.

D

Municipal Trading at Sydney.—The Sydney (N.S.W.) City Council has been informed by its legal advisers that it is within its powers to proceed with the proposed scheme for the sale of electrical appliances and the wiring of premises. It has accordingly reaffirmed its decision to carry the scheme through. Alderman Mostyn (vice-chairman of the Electricity Supply Committee) said that it was the intention of the Council to break the monopoly which enabled firms to charge 35s. for electric irons which were imported at a cost of 12s. and to prevent other apparatus being sold at similar profits. The Council is to set aside £10,000 for the purpose during the current year and it is stated that every opportunity will be given to manufacturers to send goods on consignment to the demonstration rooms. In the meantime the Electrical Employers' Association continues to attack the scheme. It is stated that the venture will result in a loss and will adversely affect the electrical traders who have done much to increase the use of the electricity supplied by the City Council. It is suggested that the whole matter should be referred to Mr. Forbes Mackay, the city electrical engineer.

Spanish Railway Electrification.—It is stated that the Bilbao-Santander Railway Company is about to convert its line between Bilbao, Las Arenas and Algorta to electric traction and that the order for the electrical equipment, including the transformer station, has been given to the A.E.G., Berlin.

Siemens-Xcel Cooking Demonstrations. — To demonstrate the efficiency and economy of "Xcel" cooking equipment, the Siemens & English Electric Lamp Co., Ltd., has arranged a model kitchen at its Upper Thames Street premises, where contractors or their clients may see actual cooking carried out. The kitchen is a well-lighted, airy apartment, and the "Xcel" equipment consists of two cookers. One is type H. 1040, consisting of an oven and a hob-plate mounted on legs of a convenient height. Above the oven is a hot cup-

The "Siemens-Xcel" Kitchen.

board and beneath it is a shelf for utensils. The oven has six 350-W elements fitted in the sides, while the hob-plate contains two boiling plates (1,800 and 1,500 W) and a grill (1,500 W). The various parts are assembled to facilitate cleaning or replacements. The elements are all of the plug-in type, and all connections and fuses are enclosed, thus eliminating any risk of harm to the user. The other cooker is of type H. 1010, and consists of the oven described in connection with the H. 1040 equipment on shorter legs and bearing a hob-plate with two boiling plates and grills.

An electricity meter is fitted in a prominent position near the cookers to enable visitors to see for themselves how much energy is consumed in cooking a meal. An efficient lady demonstrator is in charge of the kitchen. A view of the room appears in the accompanying illustration. Demonstrations are arranged as required, and intending visitors should notify the company before going.

Trade Announcements.—MESSRS. E. PINCOTT & Co. have removed from Market Street to 91, Queen Street, Exeter, where they wish to receive electrical catalogues, &c.

MESSRS. ARCHIBALD J. WRIGHT, LTD., have removed from City Road to 131, Bunhill Row, London, E.C.1. Telephone No.: "Clerkenwell 4439."

An electrical branch at 19-23, Park Street, has been opened in connection with the business of STEDDY & THOMPSON, LTD., 82, High Street, Ashford, Kent.

MESSRS. CHARLESWORTH, PEEBLES & Co. have removed their Glasgow office to larger premises at 276, St. Vincent Street, where they have their own warehouse. Telephone number unaltered: "Central 3537." The firm's head office is now situate at 5, Eden Street, Hampstead Road, N.W.1.

The Manchester branch of MESSRS. C. A. VANDERVELL & Co., LTD. (Bridge Street) has been transferred to that of Joseph Lucas, Ltd., 277, Deansgate, Manchester, where stocks of all radio apparatus are held.

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. and Messrs. James & Shakespeare report, June 8th: No change in copper and lead prices.

Messrs. Edward Till & Co. report, June 8th: India-rubber, Para fine, 1s. 8d., ½d. dec.

Catalogues and Lists.—HIGGS MOTORS, Witton, Birmingham.—June stock list of a.c. and d.c. motors, with full details and prices.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38 and 39, Upper Thames Street, E.C.4.—Catalogue No. 96, containing illustrated details and prices of cookers, fires, irons, washing machines, and other "Siemens-Xcel" domestic electrical appliances. Also the company's monthly general price-sheet for June.

MESSRS. JOSEPH KAYE & SONS, LTD., 93, High Holborn, W.C.1.—An illustrated price list of oil cans, funnels, pumps, &c.

ST. HELENS CABLE & RUBBER CO., LTD., Slough.—An illustrated pamphlet dealing with the company's "U-Seal" system of corrosion-proof fittings for "C.T.S." in positions exposed to corrosive conditions.

THE SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, W.C.2.—A catalogue of electric fans. Illustrated and priced.

FRANCIS LAMP LOCKS, LTD., 83, Pall Mall, S.W.1.—A folder describing the company's lock for preventing the theft of electric lamps.

MESSRS. FALK, STADELMANN & Co., LTD., 83-93, Farringdon Road, E.C.1.—An illustrated price list of "Antarctic" electric fans.

THE JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, S.W.1.—June blotter advertising the company's open protected hotplate.

MESSRS. HERBERT MORRIS, LTD., Loughborough.—Book 109, containing illustrations and details of electric cranes and lifts.

MESSRS. FERRANTI, LTD., Hollinwood, Lancs.—Pamphlet Ta. 159/2, describing a 300,000-V testing installation in a porcelain factory. Also a leaflet dealing with the company's radio transformers.

MESSRS. WOOTTON & Co., LTD., High Street, Ponders End, Middlesex.—A card announcing reduced prices of plywood meter boards and backboards.

DELCO-REMY & HYATT, LTD., 111, Grosvenor Road, S.W.1.—A list of the company's official service agents in various districts.

THE CAMBRIDGE INSTRUMENT CO., LTD., 45, Grosvenor Place, S.W.1.—List No. 909, illustrating and describing the "Cambridge" versatile galvanometer for numerous a.c. and d.c. measurements.

MESSRS. JOHN MOORES & Co., Ravald Street Works, Salford.—A price list of insulating fabrics, ebonite, mica, micanite, fibre, &c.

THE ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, W.C.2.—A descriptive pamphlet (No. 1024) containing illustrations and details of the company's induction motors.

Private Arrangements.—M. JAMIESON, Richmond, Surrey, radio and electrical dealer.—A meeting of creditors was held on June 3rd at Anderton's Hotel, E.C., when the chair was occupied by Mr. P. Houston (Messrs. Sydney Revill & Co.), who reported that about 10 months ago the debtor took over a business at The Arcade, Richmond. He started on a borrowed capital of £500, which was paid over to the outgoing owner of the business. The £500 was borrowed from his father-in-law and the latter was an unsecured creditor for that amount. According to the approximate statement of affairs the liabilities totalled £948 and the assets £810. In reply to a question, it was stated that there was no offer at present; the debtor, however, was desirous of carrying on the business. It was decided that the debtor should execute a deed of assignment in favour of Mr. W. A. J. Osborne, of Messrs. Corfield and Cripwell, Balfour House, Finsbury Pavement, E.C., as trustee, together with a committee of inspection consisting of the representatives of the Sloan Electric Co., the Westminster Electric Co., and Mr. E. H. Hawkins, representing creditors. The following are creditors:—

	£		£
Sloan Electric Co.	34	Fada Radio	28
Cahill, P.	32	Westminster Electric Co. ...	33
Princes Electric Co.	24	Watson, H.	22
Turpitz & Co.	24	Solicitors	20

Bankruptcy Proceedings.—ERNEST ARTHUR PYE, motor and electrical factor, 4, Oxford Mews, Edgware Road, W.—The first meeting of creditors was held on June 2nd at the London Bankruptcy Court, a receiving order having been made on May 6th upon a creditor's petition. No statement of affairs was lodged, but the debtor roughly estimated his liabilities at £1,500 against book debts of the value of £20. The debtor stated that in March, 1921, he and a partner took premises in Paddington and started business as motor and electrical factors under the style of Pryce & Co. In November, 1922, they converted their business into Pryce & Co., Ltd., with a nominal capital of £2,000. Each partner received £500 in shares and debentures for £750 were issued. The trading was not successful and in March, 1923, the debenture holder appointed a receiver and manager, who has dealt with the assets, no return being made to the shareholders. The debtor recommenced business alone in September, 1923, as an electrical factor, and was later joined by a partner. He attributed his position to the failure of his last partner to provide capital as promised, or to repay £637 which, he alleged, that partner owed him. The estate was left in the hands of the Official Receiver, to be wound up in bankruptcy.

C. H. PATRICK, 132, Much Park Street, Coventry, electrical contractor and wireless dealer.—The receiving order in this matter was made on May 14th on debtor's own petition. The statement of affairs shows liabilities of £1,315 and net assets of £299, leaving a deficiency of £1,016. Debtor attributes his failure to domestic expenses, costs of legal proceedings, depreciation in value of wireless accessories, and fall in trade in that class of goods. He commenced business without capital at his present address in 1920. He was unsuccessful, and in October, 1922, an arrangement was made with his creditors for payment of a composition of 10s. in the £, for which purpose an advance of nearly £300 was made by a relative, this amount still being outstanding at the time of the proceedings. The relative in question also provided £100 to discharge debtor's overdraft under a guarantee, and this remained unpaid. In consideration of this advance, however, debtor gave a bill of sale over his household furniture. Debtor states that he has been aware of his position since the middle of 1922. The following are creditors :—

	£		£
Accumulators of Woking, Ltd. ...	21	Jones, W. H.	375
Coventry Electrical Accessories, Ltd.	33	London Electric Wire Co. ...	34
Cable Accessories Co., Ltd. ...	33	Philips Lamps, Ltd.	31
Electro-Mechanical Supplies Co.	76	Stringer, J.	26
Hands, A. C.	65	Westlake, T. E.	30
		Jones, W. J.	40

J. MACFADDEN, 177, Higher Hillgate, Stockport, electrician.—The public examination of this debtor was held recently at the Court House, Stockport. The statement of affairs showed ranking liabilities of £243, and there was a deficiency of £234. Debtor attributed his failure to lack of capital and keen competition. In 1924 he took a lock-up shop and commenced business as an electrician with £50 borrowed capital, but he was unsuccessful. The examination was closed

M. BREINGAN, electrical manufacturers' agent, 57, Robertson Street, Glasgow.—A dividend is payable on June 29th at the offices of Mr. E. H. Stanley Craig, 128, Hope Street, Glasgow.

J. N. DAVENPORT (separate estate), electrical engineer and contractor, 39, Hill Top Avenue, Cheadle, Hulme (lately carrying on business with L. A. Hackett as Davenport, Hackett and Co. at 36, Spring Gardens, Manchester).—First and final dividend of 20s. in the £ payable at 21, Spring Gardens, Manchester.

Company Liquidations.—B.M.A.S., LTD., Ashburton Road, Old Trafford, Manchester, manufacturers of electrical ignition apparatus, &c.—The winding up order in this matter was made on a creditor's petition. The statement of affairs shows liabilities of £25,012, while the assets are estimated at £10,828, from which a sum of £1,229 has to be deducted in respect of preferential claims, leaving an amount of £9,599, which is insufficient by £14,803 to meet the loans on debentures of £24,401. The issued share capital of the company amounts to £22,200, so that there is a deficiency as regards the shareholders of £47,212. The failure of the company is attributed to the falling-off in the demand for accessories. The title of the company is derived from "Battery Magneto Accessory Services," and it was incorporated as a private concern in January, 1925, with head office and works at Trafford Park and depôts for sales and repairs at eleven other addresses. The company was formed to continue the business previously carried on by the Runbaken Magneto Co., Ltd. It appears not to have derived any working cash capital from its issue of shares, and any such capital was obtained from book debts taken over and a bank overdraft of £24,401. On January 29th, 1926, the bank appointed a receiver, who took possession of the assets. He has closed all the depôts, but is carrying on the head office and works at Trafford Park with a small staff. A full set of books has been kept. The company was first sued for debt in January, 1925, and in all the company has been sued by 33 creditors; 16 of these creditors with claims amounting to £619 have been paid, and 17 claims totalling £920 remain unpaid. The failure of the company appears to have been contributed to by the lack of working capital, and by the heavy charges for wages, salaries, commissions, and travelling expenses. The Official Receiver is of opinion that further inquiry is desirable into the formation of the company and the conduct of its business.

FOSTER CONSTRUCTION CO., LTD., electrical, &c., engineers, 60, High Street, Plaistow, E.—The report of Mr. E. T. A. Phillips, Official Receiver and Liquidator of this company, has been issued. The winding up order was made last January and accounts have been lodged showing total liabilities of £16,843 (unsecured £4,896), assets of £1,153, after allowing for the payment of preferential claims (£630), and debenture bonds (£2,316), and a total deficiency of £21,189 with regard to contributories. The company was formed as a private company in December, 1914, with a nominal capital of £5,000, subsequently increased to £40,000, of which £17,697 has been issued. The object was to acquire from Walter and Arthur Foster (trading as W. Foster & Son), a business carried on by them, the consideration being agreed at £4,555 in cash and shares. The failure is attributed to insufficient capital, lack of up-to-date machinery; to taking contracts which the company could not profitably handle, and other causes.

MIDDLETON ELECTRIC TRACTION CO., LTD.—A meeting of members is called for July 12th, at the Electrical Federation Offices, 88, Kingsway, W.C., to hear an account of the winding up from the Liquidators, Messrs. T. Bower and T. H. Underhill.

REFLEX RADIO CO., LTD.—First meeting of creditors and contributories, June 14th, at Carey Street, W.C.

CAR LIGHTING & IGNITION CO., LTD.—A meeting of creditors was held yesterday, June 10th, at the offices of Messrs. Bradford & Gale, 584, Christchurch Road, Boscombe. (This meeting was purely formal. All creditors have been or will be paid in full.)

JOSEPH OXLEY (SHEFFIELD), LTD.—Voluntary liquidation resolution passed May 28th. Meeting of creditors, June 14th, at 46, Bank Street, Sheffield. Liquidator, Mr. C. L. Widlake, 9, Paradise Square, Sheffield.

Dissolutions of Partnership.—TAYLOR & ODDY, electrical engineers and metal workers, Kiln Hill, Slaithwaite, Yorks.—Mr. F. Oddy and Mr. F. Ramsden have dissolved partnership. Mr. Taylor will continue on his own account as electrical engineer at Belmont Works, Slaithwaite, and Mr. Oddy as sheet metal worker at Kiln Hill.

ANKH INSULATOR CO., manufacturers of mouldings for electrical work, Merritt Mews, Merritt Road, and Courtney Works, Kneller Road, Brockley, S.E.—The partnership between Messrs. H. C. Bryson, B. Purdy, A. Purdy, and J. Purdy has been dissolved by order of the High Court. Debts will be attended to by Mr. S. W. Revill, Cromwell House, Fulwood Place, High Holborn, W.C., the Receiver appointed by the High Court on April 13th, 1926.

A. G. WALL & CO., wireless dealers, motor-cycle agents, &c., Brighton Road, Purley.—Mr. A. G. Wall and Mr. W. J. Boxall have dissolved partnership Mr. Boxall will attend to debts and continue the business.

R. WRIGHT & CO., electrical engineers, Tyson Street, Cheetham Hill, Manchester.—Mr. R. J. Wright and Mr. J. E. Connell have dissolved partnership. Debts will be attended to by Mr. Wright, who will continue the business under the same style.

Belgian Engineering Wages.—It is reported that an increase of 5 per cent. in their wages has been granted to employés in the Belgian engineering industry by a commission appointed to deal with the matter.

Swiss Electrical Exports.—The past year witnessed a further development in the foreign trade of electrical engineering concerns in Switzerland, the exports during 1925 having attained a value of approximately £2,355,600, as compared with £2,160,600 in 1924. Details of last year's exports are given below :—

	£
Dynamos and machinery	1,123,080
Electrical apparatus and instruments	897,440
Copper cables	109,000
Incandescent lamps	92,160
Electric locomotives	85,640
Telephone and telegraph apparatus	23,280
Accumulators	12,400
Porcelain insulators	6,960
Electrodes and carbons	5,640
	£2,355,600

Italy and Germany were the best customers for Swiss dynamos and motors, followed by Japan, Poland, Holland, Spain, Brazil and France. For electrical apparatus and instruments France was responsible for the major portion (16 per cent.), followed by Spain, Great Britain, Belgium and Italy. France and England were the best markets for cables, while France and Sweden took the majority of the electric lamps; Germany and Brazil led as regarded accumulators, and France and Belgium took the bulk of the insulators.

A German Electrical Company's Report.—The Bergmann Electricity Works Company, Berlin, whose financial results were recorded in our issue of May 21st, states that a steady revival in business took place in the first half of 1925, which, however, was succeeded by a diminution in the orders in the later months of the year. The measures of economy adopted by industrial works and public authorities contributed towards the decline in sales. As a consequence of the high rate of interest the construction or extension of hydro-electric works was of rare occurrence, although the company participated in the establishment of long-distance transmission lines and transformer works. In the turbine branch the home sales were small, but success was obtained by the transformer and switchboard branches. Owing to the unfavourable situation of the heavy iron and steel trades the sale of electric furnaces was unsatisfactory; otherwise the industrial department received large orders from the paper, chemical, sugar and food products branches. The railway department felt the decline in orders placed by the Reich railway authorities, although the overhead line section obtained contracts from the Austrian and Dutch railways. In the case of cables for heavy currents the turnover considerably increased, and the diminution in State orders for telephone and telephone cables was compensated for by other orders. Improved export trade is reported, orders having been booked for central station turbines and for the electrification of sugar works in the Dutch East Indies, despite foreign tariffs and severe competition. With regard to the current year it is stated that the decline in orders has ended and a slight improvement has taken place.

Unemployment.—The number of persons registered at the Employment Exchanges on May 24th was 1,597,000. This total was 15,044 less than that of May 17th, but 411,178 more than on May 25th, 1925. In addition, claims had been presented by 307,000 persons thrown out of work on account of the lock-out in the coal industry.

British Traders in Australia.—According to the fifteenth annual report for the year ended December 31st, 1925, the membership of the Australian Association of British Manufacturers and their Representatives at the close of last year numbered 1,082, composed of 544 British manufacturers and 538 Australian representatives of British manufacturers, an increase of fifty-nine during the year. Mr. R. W. Knox, President of the Association, has arrived in London, and will be pleased to see members and others interested in Australian trade, by appointment, at the offices of the Association, Room 605, Australia House, Strand, London, W.C.2. (Telephone, City 9880.)—*Board of Trade Journal.*

Stoker Contract.—MESSRS. E. BENNIS & CO., LTD., have received from Messrs. Charles Macintosh & Co., Ltd., of Manchester, an order for five sprinkler stokers and five independent bucket elevators, for their set of five Lancashire boilers.

A Deserving Cause.—We are asked to draw attention to the Diamond Jubilee of Dr. Barnardo's Homes—a national charity whose funds, like those of many other excellent institutions, suffered severely through the General Strike. We commend this very worthy object to the generous support of our readers. The celebration takes place on June 26th, the Duke of York presiding.

New French Company.—A company has lately been formed in Paris (13, Rue du Quatre Septembre), with a capital of 500,000 fr. and the title La Société Electro-Chimique Phœnix.

The Norwegian Domestic Electrical Market.—From an article upon the above subject in a recent issue of *Commerce Reports* it is gathered that practically all Norwegian homes are equipped with electrical appliances of some sort or other. Cooking equipment and washing machines are not in general use, although hot-plates are very commonly found. The market is satisfied to a great extent by native or Swedish manufacturers. The imported appliances are mainly German or American. The Norwegian manufacturers of electrical appliances have retail distributing shops or sell directly to retail hardware shops and electrical equipment stores.

Conditions in Central America.—The Department of Overseas Trade has published a series of reports upon conditions in Central American states. Mr. H. Apfel, acting British Consul-General at Guatemala, reports that in that republic the demand for electrical appliances is increasing owing to the development of hydro-electric power. In the supply of these goods the United States and Germany predominate, but there should be an opening for British manufacturers, provided that prices are competitive and the requirements of the market are carefully studied. Unsuitable representation is often the cause of loss of orders. The shortage of reliable local agents could be overcome by the co-operation of manufacturers or shippers of non-competitive lines, and local representation should be strengthened by periodical visits by travelling salesmen. Punctual delivery is essential, as that is one of the advantages gained by the United States, owing to its proximity. During the past year a contract for the installation of an automatic telephone system in Guatemala City was awarded to the A.E.G., Berlin. Competition in the Republic of Honduras is mainly American; Germany has recovered the market which she lost during the war in cheap goods, but she offers little competition to British goods, according to Mr. A. H. King, British Consul at Tegucigalpa. In Salvador (states Mr. H. C. Swan, acting Consul at San Salvador) there is a bias in favour of American products, but an appreciation of United Kingdom manufactures is not lacking, and there is no reason why the imports of British goods should not be increased. Manufacturers are warned to be careful of their choice of representatives. The 1923 import statistics (the latest available) show electrical machines to the value of $69,280 (as against $70,495 in 1922). Great Britain supplied motors, boilers, and turbines to the value of $5,508, electrical material valued at $273, and electrical machinery valued at $41. A report on Costa Rica, by Mr. F. N. Cox, British Consul at San Jose, shows that during 1924 electrical goods to the value of £54,780 were imported by the Republic. The reports on Guatemala, Honduras, and Salvador are combined, and can be obtained at 2s. net from the Stationery Office. The report on Costa Rica is combined with one on Panama, and costs 1s. net.

New Italian Companies.—Among the new electricity supply undertakings lately organised in Italy are the Società Elettrica Centro Lario, Milan, capital, 600,000 lire, and La Società Elettrica Teramo, Genoa, capital, 2,000,000 lire.

Book Notices.—"Faraday House Journal."—In the summer term issue of this well-produced organ, Mr. H. Rainford deals with "Flameproof Mining Electrical Apparatus"; Mr. B. J. Rowe writes on the "Protection of Alternators"; and Mr. H. E. M. Kensit indicates the "Financial Value of Education." Some of the students seem to have enjoyed their experience as volunteers during the general strike, the effect of which has been to prolong the term to July 27th.

The *Journal* of the South African Institution of Engineers. Vol. XXIV, No. 10. May, 1926. Price 2s.

"House Telephone Systems."—A recent revised issue of "Technical Pamphlets for Workmen," by the Post Office Engineering Department. H.M. Stationery Office. Price 6d. net.

"The *Transactions* of the South African Institute of Electrical Engineers." Vol. XVII, Part 4; April, 1926. Price 2s.

Social Event.—The Union Cable Co., Ltd., entertained a party from the Borough of Kingston-on-Thames Electricity Works, on their Sports Ground at Dagenham, on Saturday, 5th inst. Both sides were strongly represented, and keenly contested the cricket and lawn tennis matches that were played. Mr. T. A. Kingham, A.M.I.E.E., borough electrical engineer of Kingston, and Mr. J. Snow Huddleston, M.I.E.E., general manager of the Union Cable Co., were present.

Views on Australian Protection.—The recent statement by Sir John Monash (reported in our last issue, p. 831) that the high tariffs on imported articles handicapped the extension of the use of electricity, has aroused a storm of protest from Australian electrical manufacturers. One of them states that, on the contrary, protection has led to reductions in prices. He quotes electricity meters as an example and avers that immediately a local industry started the prices fell by 50 per cent. It is also stated that in a recent competition for a switchgear contract in New Zealand, an Australian manufacturer was able to underquote competitors in Great Britain and the United States. Another manufacturer says that in 1925 the prices of Australian electrical apparatus compared favourably with those for similar appliances in other large industrial countries, and that it is not the cost of appliances but the cost of electricity which is the handicap. The secretary of the Australian Industries Protection League stated, according to the Melbourne *Herald*, that Sir John Monash did not seem to grasp the fact that his undertaking (the Yallourn electricity scheme) could not succeed without the establishment of secondary industries, and that that could only be done by the protection afforded by the tariff. "The more people there are engaged in industry the greater demand there will be for electricity for lighting, and there will be a greater demand for electrical appliances, thus leading the way to mass production. Then, as in the case of other locally-made products, there will be a reduction of prices, and all will benefit."

Imperturbable Lamps.—On Friday last week the showrooms of the Edison Swan Electric Co., Ltd., Queen Victoria Street, E.C.4, were severely damaged by a loaded 12-ton lorry which got out of the driver's control and crashed into the windows. The concussion was terrific, but in spite of it the "Ediswan" lamps in the window continued to burn.

For Sale.—The Director of Army Contracts invites offers for one G.E.C. 150-kW rotary converter, with starter, &c. (See our advertisement pages to-day.)

Lighting and Power Notes.

Australia.—MELBOURNE.—The *Electrical Engineer of Australia and New Zealand* states that the City Council is making arrangements with the Victorian Electricity Commission to take further bulk supplies of electricity to the extent of 2,000 kW. At present the Council is taking a minimum of 10,000 kW and a maximum of 11,000 kW. Its own generating plant has a capacity of 27,000 kW.

CLARENCE RIVER.—The first report on the County Council's Nymboida hydro-electric undertaking, for the year ended December 31st last, shows a total revenue of £11,747, and working expenditure of £4,976. After meeting capital charges, there was a net deficit of £2,337. The sales of electrical energy amounted to 720,809 kWh and the capital expenditure was £161,000. The engineer and manager of the undertaking is Mr. H. V. S. Wilton.

Basingstoke.—OPPOSITION TO SCHEME.—The Rural District Council and the Town Council have given notice of opposition to the application of the Aldershot Gas, Water, and District Lighting Co. for a Special Order to supply electricity in the parishes of Newnham and Natly Scures. The Town Council has asked the Commissioners to postpone the hearing of the application so as to give the Corporation time to study the figures as to the cost of supplying the parishes named from its own undertaking. The Rural District Council has asked the Corporation to state definitely within three months whether it intends to supply the parishes in question.

Canada.—ELECTRICAL DEVELOPMENT.—The Shawinigan Water and Power Company has recently completed arrangements with the Duke-Price Company for the supply of 100,000 h.p., which, it is understood, will be transmitted to the City of Quebec or the immediate vicinity.

What will be the highest voltage transmission line in Canada, and one of the longest in America, will be installed between Ile Maligne and Quebec in the course of the summer. This line will be about 150 miles in length, and the voltage will be 150,000. It is expected that the construction of the new line will be completed early in 1927.

The Premier of Ontario has announced that the Government has authorised the completion of an agreement for the delivery by the Gatineau Power Company at the inter-provincial boundary, in the vicinity of Ottawa, of from 230,000 to 260,000 h.p. of hydro-electric energy at a price of $15 per h.p. Delivery will commence with a supply of 80,000 h.p. in 1928, and the total delivery is to be completed in 1931. The contract is for 30 years, dating from 1928. The energy will be transmitted at a point near Ottawa to connect with the Niagara system near Toronto. The transmission lines will be approximately 230 miles in length, and will require an expenditure of from $10,000,000 to $15,000,000. Construction of these lines will be commenced immediately.

A $500,000 estimate for preliminary work was voted during the recent session of the Ontario Legislature.

An agreement has been completed under which the International Paper Company will develop Grand Falls on the St. John River, producing approximately 50,000 h.p.

Chester.—LOAN SANCTIONED.—The Electricity Commissioners have given sanction to the borrowing by the Corporation of £20,000 for mains and additional works in connection with the distribution of electricity.

Continental.—SWITZERLAND.—Negotiations are proceeding between the St. Gall-Appenzell Electric Power Co., and the authorities of the Canton of Glarus, for the construction of a large hydro-electric power station to utilise the water power of Lake Muttern, the Limmern Falls and the Upper Linth River in East Switzerland. The scheme has been under consideration for some years, the original idea being to establish, in two stages, only a winter-period generating plant, the first stage providing for an output of 22½ million kWh, with a later extension to 39 million kWh. A new scheme has now been drawn up which provides for a 115,000-h.p. station, capable of being run the whole year round. Lake Muttern would supply the water in winter, with the Limmen Falls intake as a supplementary feeder, while the River Linth would furnish the power in the summer. The conduit pipes will all be concentrated on a single generating station which will be built at Tierfeld, near Linthal. The cost of the installation is estimated at £2,058,400.

FRANCE.—Some interesting particulars of the hydro-electric development in France are given in a recent issue of the *Revue Industrielle*, which estimates that water power to the extent of 10 million h.p. is available. It is also estimated that whereas the capacity of the hydro-electric plants in operation prior to the war was only 550,000 kW, it now amounts to over 2 million kW, of which 1,233,000 kW is furnished by plants of a capacity of more than 1,000 kW. At the present time work is in hand on the establishment of new stations representing a total of about 350,000 kW.

Halifax.—LOAN.—The Corporation Electricity Committee is seeking sanction to the borrowing of £30,000 for extensions to the electricity mains and the erection of a tramway shelter at Shelf.

Kingston-on-Thames.—YEAR'S WORKING.—We have received from Mr. T. A. Kingham, borough electrical engineer, a copy of his report, together with the statement of accounts for the year ended March 31st last. The trading account shows a total income of £56,388 and working expenditure of £22,444, leaving a balance of £33,946, which was transferred to profit and loss account, together with items from other sources of revenue, making a total of £36,703. After meeting capital and other charges there was a net surplus of £6,672, which was carried to appropriation account, together with a balance from the previous year of £10,896, making a total of £17,568 available, of which £3,000 was contributed to the borough fund and £14,568 carried forward. The capital expenditure during the year amounted to £24,994 and included £14,211 for mains and services. A new 3,000-kW turbo-alternator and a new boiler were put into commission during the year, and the conversion of the system of supply from single-phase to 3-phase was continued.

Liverpool.—LOAN SANCTIONED.—The Electric Power and Tramways Committee has received sanction to the borrowing of £2,616 for mains and services in connection with the supply of electricity to the Springwood housing estate.

Manchester.—PROGRESS DURING APRIL.—During the month of April the Corporation electricity undertaking showed an increase in connections of 2,626 kW, bringing the total to 282,194 kW; and the number of applications received for supply, including consumers for additional supplies, was 767, representing a total of 2,365 kW. The number of hired cookers connected increased by 116, bringing the total actually on circuit to 1,612. Applications for the hire of cookers totalled 129.

Mid-Cheshire.—PROPOSED CHANGE-OVER.—The Mid-Cheshire Electricity Supply Co., Ltd., is to apply for consent to change over its system of electricity supply in certain districts from 3-wire d.c. at 220 V to a.c. 3-wire, 50 cycles, 220 V.

Newport Pagnell.—ELECTRICITY SUPPLY.—The Rural District Council has consented to the Northampton Electric Light Co. erecting overhead h.p. lines from Wolverton to Bletchley, and to the erection of l.p. overhead distributing mains at Water Eaton.

New Zealand.—ELECTRICAL DEVELOPMENT.—According to the *Electrical Engineer of Australia and New Zealand*, owing to the increasing demand for electricity, the Dunedin City Council has recently approved proposals for considerably increasing the capacity of its hydro-electric power station. Two alternatives were investigated: one involving the raising of the dam to a height of 110 ft., the construction of a tunnel 4¾ miles in length, and the building of an entirely new power station, and the other providing for utilising the increased head made available by the raising of the dam from 40 ft. to 60 ft., and extensions to the existing power plant. The latter proposal was accepted, as the capital expenditure was less than for the former, and also because the development is to be progressive, and certain of the new plant will be put into service at a comparatively early date. The adopted proposals provide for the immediate construction of a subsidiary power station of 3,000 kW capacity just below the dam at Waipori Falls; the cutting of a second tunnel from the weir to the existing surge chamber and the laying of a new pipe line from the surge chamber to the power house; the replacement of the six present 1,000-kW sets in the power station by 3,000-kW sets, and the construction of a further tunnel and 3,000-kW subsidiary power station. The complete scheme will provide an installed capacity of 27,000 kW.

The Public Works Department proposes to construct main transmission lines that will undoubtedly link up the Waipori Falls station with the Lake Coleridge development in the north and the Lake Monowai development of the Southland Power Board in the south. A 110,000-V line that will form part of this link is at present under construction by the Department from Lake Coleridge to Oamaru.

POVERTY BAY.—The ratepayers of the Poverty Bay Electric Power Board's district have sanctioned the raising of a loan of £280,000 for the electrification of the district from the Government power station at Waikaremoana.

Northern Ireland.—BELFAST.—The accounts of the city electricity undertaking (engineer: Mr. Johnstone Wright) for the year ended March 31st last record a total revenue of £355,753, as compared with £341,253 in the preceding year. The cost of production was £144,467, an increase of £678, leaving a gross profit of £211,286 (£197,913). After providing for capital and other charges there was a net surplus of £62,402 (£64,961). Reductions equivalent to a revenue of £10,000 were made in the charges for electricity during the year. The sales of electricity amounted to 45,086,797 kWh, an increase of 4,879,237, as compared with 1924-25. In his report for the year, Mr. Wright proposed further reductions in the charges, but advised that the date for putting the new scale in operation be left in abeyance until the full effect of the coal dispute was ascertained.

Nuneaton.—INQUIRY.—On June 1st and 2nd, Colonel T. C. Ekin conducted an inquiry, on behalf of the Electricity Commissioners, into an application by the Corporation for consent to extend its generating station. Mr. R. A. Willes, barrister, for the Corporation, said the Leicestershire and Warwickshire Electric Power Co., Ltd., had for some time past been supplying electricity in bulk to the Corporation, and notice to terminate the agreement was given by the latter some time since. The company had made certain offers to the Corporation. He gave figures showing the respective costs of local generation and bulk supplies up to the year 1933. Mr. E. M. Lacey, consulting engineer, said the estimated capital expenditure on the extensions was £77,550. He was convinced it was cheaper to generate locally than go to the company for a supply in bulk. The extensions would ensure an additional 3,000 kW. Mr. S. C. Gibson, electrical engineer to the Corporation, said that several of the largest consumers were asking for more reasonable terms, and had hinted that unless these were conceded they might set up their own installations or remove their works to other districts. He thought the proposed extension would tend to cheaper production. For the company it was stated that its reason for opposing the Corporation's application was that it considered it could supply electricity more cheaply. If the Nuneaton works were extended, the site would not be sufficient in a few years' time. The Commissioners will give their decision in due course.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

CHELMSFORD.—*The Electric Supply Corporation, Ltd.*—From 10½d. to 9d. per kWh. During the continuance of the restriction in the use of electricity the minimum charge will not be enforced.

WORTHING.—Lighting: 6d. per kWh. Heating and power: 1½d. per kWh. Kinemas, &c.: 4d. per kWh.

Plymouth.—NEW PLANT.—The Electricity Committee has obtained sanction to the extension of the existing generating station at Prince Rock, by the installation of one 7,500-kW, 3-phase, 50-cycle turbo-alternator, together with the necessary auxiliary plant. The Committee has authorised cable extensions at a cost of £4,500.

Reigate.—LOAN.—The Town Council has applied for sanction to a loan of £18,000 for a fourth engine and alternator, switchboard, &c., and the cost of replacing the three 4-cylinder engines by three 6-cylinder engines.

Retford.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £33,580 in connection with its electricity scheme for the district.

Sheffield.—ELECTRICITY EXTENSIONS.—During April the Corporation Electricity Committee approved extensions and works and extensions of mains for general distribution purposes, at an estimated cost of £20,116.

South Africa.—WITBANK.—Shortly before midnight on April 30th, No. 1 20,000-kW generating set at Witbank was connected, *via* step-up transformers, to the 132-kV transmission circuit for test purposes. All being in order, the set was shortly afterwards paralleled with the Victoria Falls Power Co.'s system at the Brakpan end, and carried a small load for a short time. On May 3rd the set commenced commercial operation, and, according to the *S.A. Mining and Engineering Journal*, there is an appreciable amount of extra load awaiting the company, notably the additional ten tube mills in the Government areas, so that set No. 1 Witbank will be called upon for its full output as soon as it has passed through its probation period, and its connection to the Witwatersrand system, hitherto without spare generating plant, will be a source of relief and satisfaction to consumers and station operatives alike. Although other sets of similar size and speed are already in operation, No. 1 Witbank is a representative of the largest units running at 3,000 r.p.m. in the world.

Southport.—ELECTRICITY IN BULK.—After considering an application from the Birkdale District Electric Supply Company, Ltd., for a reduction in the charges for the bulk supply of electricity to the company, the Electricity Committee has provisionally agreed on reduced charges to be embodied in a new agreement.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—The Crewe Corporation, to extend its area of electricity supply so as to include certain parts of the rural district of Nantwich; the Cranleigh Gas and Coke Co., Ltd., to supply electricity in parts of the rural district of Hambledon; and the Midland Electric Light and Power Co., Ltd., to supply in certain parishes in the rural districts of Lutterworth and Rugby.

The Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the Rural District Council of Plympton St. Mary to supply electricity in the rural district.

Stoke.—EXTENSION OF SUPPLY.—The Electricity Committee has decided to lay cables to the Abbey Hulton Estate at a cost of £5,000, and to erect a sub-station at a cost of £2,000.

Sutton Coldfield.—EXTENSION OF SUPPLY.—The Town Council is to extend its electricity supply to Little Aston and Streetley and to erect a new sub-station at Streetley, at a cost of £11,560.

Torquay.—LOAN SANCTIONED.—The Electricity Committee has received sanction to the borrowing of £1,000 for transformers and switchgear for Newton Abbot power station.

Wakefield.—LOANS.—The Electricity Committee is applying for sanction to the borrowing of £10,000 for sub-stations and transformers, and £6,000 for meters.

Wimbledon.—LOAN.—The Electricity Committee is to apply for sanction to a further loan of £10,000 for the purchase of electrical domestic appliances to be let out on hire.

York.—"ALL-ELECTRIC" HOUSE CHARGES.—The Housing Committee has accepted the terms of the Electricity Committee in connection with the supply of electricity to the "all-electric" houses as follows:—Standing charge of 9d. per week, plus .675 per kWh, equalling, on an estimated consumption of 60 kWh, a total charge of 4s. 1d. per week per house.

LOAN.—The Electricity Committee is applying for sanction to a loan of £17,000 for mains and services.

Tramway and Railway Notes.

Bradford.—TRACK RENEWALS.—At its specially-convened meeting, on May 28th, to consider whether it should carry out the scheme for relaying the Manningham Lane tramway track, at a cost of £27,715, or suspend it in favour of a modified scheme of patching up until such time as the tramways could be gradually changed over to motor-'bus services, the City Council decided that renewal of the track in full should proceed forthwith. There were protests from the Bradford Chamber of Commerce, the Chamber of Trade, the Property Owners' and Ratepayers' Association, and a petition signed by traders in Manningham Lane.

The Tramways Committee has decided to recommend the Council to rescind its decision to renew a portion of the tramway track from Four Lane Ends to Allerton. It had been decided to replace the single track on this route by a double track at an approximate cost of £20,000.

Burnley.—TRACK RENEWALS.—The Tramways Committee proposes to spend a sum of £14,000 on relaying a portion of the tramway track.

Colne.—NEW CARS.—The Ministry of Transport has sanctioned the borrowing by the Town Council of £6,305 for the purchase of three new tramcars and two new tramcar trucks.

Continental.—BELGIUM.—The Société Nationale des Chemins de Fer Vicinaux, of Brussels, is electrifying about 14 miles of its steam local railways in the Louvain district, a first section having recently been completed and put in operation.

SWITZERLAND.—The Swiss Federal Railway authorities in Berne have recently voted a credit of £592,000 towards the cost of electrifying the railway between Yverdon, Biel, and Olten, a distance of about 78 miles.

Huddersfield.—TRACK RENEWALS.—The Corporation is to relay the tramway track between the top of Viaduct Street and Blacker Road.

Irish Free State.—DUBLIN AND LUCAN TRAMWAY.—The Dublin United Tramways Co. has informed a deputation representing the unemployed in Dublin and Lucan that the laying of the tramway to Lucan, which is expected to provide work for 600 men, will be undertaken as soon as possible. The Tramways Company estimates that, owing to the unsuitable gauge, worn-out rolling stock, and an obsolete power station, an expenditure of £70,000 would be needed to put the Lucan line into working order. The company, however, has decided to open the line, provided that the Borough Commissioners and the Councils in the towns grant an extension of their leases of the line in the city. The City Commissioners, the Dublin County Council, and the Blackrock Urban District Council have agreed, but the Rathmines, Pembroke, Kingstown, and Dalkey Councils still withhold their consent, the obstacle being the payment by the company of a road grant.

Manchester.—DEPOT EXTENSIONS.—The Corporation is to provide increased tramcar depôt accommodation, at a cost of £300,000.

South Shields.—LIGHT RAILWAY ORDER.—The Minister of Transport has made an Order in favour of the South Shields, Marsden, and Whitburn Colliery light railway scheme.

Sunderland.—TRAMWAY IMPROVEMENTS.—The Tramways Committee has decided to double the present single tramway track from Spelter Works Road to the Grangetown terminus, at an estimated cost of £7,000.

Telegraph and Telephone Notes.

International Telegraph Union.—PROGRESS IN 1925.—In a recent issue of the *Journal Télégraphique*, the official organ of the International Telegraph Union, a brief summary is given of the extension of the world's telegraph system during 1925 and of the progress of the Union. Thus it is stated that Southern Rhodesia and the Tanganyika Territory joined the Telegraph Convention and that Ecuador and Colombia are following their example; Lithuania, the French Somali Coast, and the Republic of Honduras also joined the Wireless Telegraph Convention. Among the new submarine cables brought into use during the year were one between England and Spain, one between New York and Bay Roberts, one between Bay Roberts and London, one between Victoria in British Columbia and Suva (Fiji), one between Emden and the Azores, and one between Marseilles and Phillipeville. The most important new service of the year was, however, that inaugurated by the Compagnia Italiana dei Cavi Telegrafici Sotto-Marini between Italy and North and South America; this company inaugurated a service between Spain, the Azores, and America in January, 1925, and between Anzio and New York in February, and between Italy and Brazil, Argentine, Uruguay, and Chile in September. The Italian-South American cable covers a distance of 7,250 miles in the following sections:—Anzio-Malaga, 990 miles; Malaga-Las Palmas, 850 miles; Las Palmas-St. Vincent, 937 miles; St. Vincent-Fernando de Norontia, 1,476 miles; Fernando de Norontia-Rio de Janeiro, 1,687 miles; Rio de Janeiro-Montevideo, 1,202 miles; and Montevideo-Atalaya, 108 miles. In addition, Anzio is connected with Rome by two land lines (37 miles) and Atalaya with Buenos Aires by a single land line (78 miles).

As regards international wireless telegraphy, the report states that last year communication was established between Poldhu (England) and Milverton, near Cape Town; between Holland and the Dutch East Indies; between Italy and the United States; between Italy and Egypt; between France and China; between Belgium and the Belgian Congo; and between Panama and Barbados. It is added that notwithstanding the increased use of wireless telegraphy, the extensions of submarine cables that are taking place would appear to indicate that radio-telegraphy is not looked upon as taking the place entirely of wired telegraphy.

Police Telephones.—CONSTABLES' KIOSKS.—The Reigate Watch Committee is considering the adoption of the police telephone box system. By the recent adoption of this system in Newcastle it has been estimated that the town will make a saving on the rates of £13,000 through the substitution of 51 telephone kiosks for six out of the nine police stations now in use.

United States.—THE CAPITOL'S TELEPHONES.—To such an extent has the use of the telephone increased in the halls and offices of Congress and the Supreme Court that it has been necessary to increase the facilities by installing a new switchboard and associated apparatus. The Capitol's central telephone office is now of sufficient size to serve a city of about 15,000 population; it is known as "Main 3120" and has 120 trunk lines connected with the Washington offices of the telephone company and 80 direct lines to other private branch exchanges of the Government. Ultimately it is expected that this exchange will require about 200 trunk lines and 120 direct lines. Service is continuous throughout the 24 hours of the day; women serve as operators during the business hours, while men are on duty during the evening and night. The present switchboard consists of 18 positions, but is so arranged as to accommodate 17 additional units which will be sufficient to provide service for 3,000 telephones, says *T. & T. Age*. During the present session of Congress the Capitol office is handling about 27,000 calls daily, and this figure is constantly increasing.

Radio Notes.

Colombia.—PROPOSED STATION.—A broadcasting station with a range of 800 kilometres and a wave-length of 275 metres is planned in Colombia. According to *Commerce Reports*, bids have been called for the erection of the station.

India.—NEW COMPANY.—Prominent Bombay business men have floated the Indian Broadcasting Co., Ltd., with a capital of £112,500 in 10-rupee shares, of which 60,000 shares will be issued at present. The company will build stations at Calcutta and Bombay, which, says the *Daily Mail*, it is anticipated will be ready to transmit programmes next December.

Mexico.—NEW EQUIPMENT.—The installation of new 500-watt equipment was completed at the radio station in Chapultepec Park, Mexico City, last month, and will greatly increase the efficiency of communication, says *Commerce Reports*. The new station will use reduced-size antennæ of about 45 ft. in height. The old towers at this station are being dismantled, recut to size, and sent to various parts of Mexico for similar stations. At the Chapultepec Radio Laboratories work is progressing on a transmitter, similar to the one described above, which is destined for the city of Campeche.

Panama.—BROADCASTING INAUGURATED.—A broadcasting station was recently inaugurated at Balboa in the Panama Canal zone, and has resulted in a demand for crystal receiving sets.

Salvador.—RADIO DECREE.—The President of the Republic of Salvador has issued a decree setting forth new radio regulations; it abrogates one of May 1st, 1923, which has heretofore been the basis of radio control. Some of the principal provisions of the new regulations are that broadcasting shall be a Government monopoly, and that owners and managers of places of public entertainment may be required to permit the broadcasting of their performances. Foreigners will be permitted to operate receiving sets only when they renounce the right to present claims through diplomatic channels. An initial charge of 5 colones is made for receiving licences, and in addition thereto a monthly payment of 3 colones is required. The Government will install receiving sets for 30 colones; sets capable of regeneration are prohibited.

The B.B.C.—2LO BREAKDOWNS.—The London station of the British Broadcasting Co., Ltd., (2LO) experienced some trouble last week, apparently due to an insulation fault, and the old transmitter at Marconi House had to be brought into use for a time. It was also used on June 7th when 2LO again developed a fault.

Turkey.—BROADCASTING PROJECT.—A French company is negotiating for land at Yeni-Bagtche, below Stamboul, on which to erect a broadcasting station, according to *Commerce Reports*. Programmes from European stations will be relayed.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Asia Minor.—BAGDAD.—June 28th. Direction Générale des Chemins de fer d'Anatolie. One electrically-driven semi-portal crane. (A.X. 3191.)*

Australia.—MELBOURNE.—June 28th. Electricity Commission of Victoria. 22,000-V transformers and spares. (B.X. 2528.)*

August 23rd. 10-in. disk suspension insulators. B.X. 2614.)*

June 16th. Victorian Government Railways. One heavy-current motor generator set. (B.X. 2527.)*

July 14th. A.c. power interlocking machine. (B.X. 2596.)*

September 1st. Automatic sub-station equipment for Elwood sub-station. (B.X. 2598.)*

June 16th. City Council. Turbo-alternator, exciter and condensing plant.*

August 11th. H. and l.p., 3-phase sub-station switchgear.*

August 3rd. Postmaster-General's Department. Telephones and dials.*

August 10th. Telephone exchange indicators. (B.X 2597.)*

BRISBANE.—August 26th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator.*

Belfast. — June 12th. Electricity Committee. D.c. switchgear for sub-stations and transformer kiosks. (May 28th.)

Belgium.—June 26th. Belgian Post and Telegraph Authorities, La Salle Madeleine, Brussels. Telephone cable for Mons, Ath, Gramont and Hal. Particulars (Cahier des Charges Special No. 3-187) for 7½ fr.

Bentley-with-Arksey (near Doncaster). — June 22nd. Urban District Council. Tubing, wiring and electrical fitting of 32 houses and 16 bungalows on Jossey Lane housing site. Mr. P. C. Woodhall, engineer, Council Offices, Bentley.

Brazil.—PORTO ALEGRO.—July 8th. Municipal Council. Electrical material for street lighting. (B.X 2571.)*

Bristol.—June 14th. Electricity Department. Additions to the premises at Feeder Road generating station. (May 28th.)

Burnley.—June 26th. Joint Hospital Board. Electric lighting system at the Sanatorium, Marsden Road (June 4th.)

Colchester.—June 15th. Education Committee. Electric lighting installation at North Street schools. Mr. W. Frisby, borough electrical engineer.

Dublin.—June 24th. County Borough Commissioners. Arc lamp, carbons, electric cookers, and h.p. and l.p. circuit breakers. (See this issue.)

June 28th. One steam turbo boiler feed pump, three air filters, two electric vehicles, and steam and water meters. (See this issue.)

Dundee.—June 18th. Electricity Department. L.p. cable. (June 4th.)

Egypt.—CAIRO.—June 30th. Ministry of the Interior. One Diesel engine, direct coupled to an 80-kW generator, complete with switchboard. (B.X. 2537.)*

June 19th. Minister of Education. Dynamo and motors.*

July 10th. Director-General, State Domains Administration (Commercial Service), Savoy House, Qasr el Nil Street, Cairo. Three semi-Diesel engines and two centrifugal pumps.

August 2nd. Director-General, Mechanical Department, P.W.M., Cairo. 400-b.h.p. Diesel engine, driving an air compressor, together with auxiliary machinery.

Epsom.—June 14th. Electricity Department. Removal of boilers and setting them up as fuel tanks, overhead travelling crane, two 300-kW Diesel engine-driven generators and accessories, oil-purifying plant and cooling tower. (May 28th.)

Glasgow.—County of Dumbarton Education Authority. Electrical work, &c., and additions, &c., at Twechar Public School. Mr. B. P. Gibb, Master of Works, 18, Park Circus, Glasgow.

June 19th. Corporation. Electric light installation at Child Welfare Clinic, Tollcross. Forms from Office of Public Works, Cochrane Street.

Govan.—June 12th. Clyde Navigation Trust. Electrical stores, &c., from July 1st, 1926. Superintendent of Stores, No. 1 Graving Dock, Govan.

India.—June 15th. India Store Department. 70,000 (approx.) copper bonds for track rails. (May 14th and 21st.)

July 2nd. E.h.p. armourclad switchgear. (See this issue.)

Leeds.—June 18th. Highways Department. One 550-V, d.c. motor, with switchboard, switchgear, &c. (See this issue.)

Lepton (near Huddersfield).—June 19th. Electrician's work required in alterations, &c., to Coloms Wesleyan Sunday school. Quantities from Stocks, Sykes & Hickson, architects, 4, St. Peter's Street, Huddersfield.

London.—METROPOLITAN ASYLUMS BOARD.—June 16th. Installation of electric cable for arc light treatment apparatus at St. Luke's Hospital, Lowestoft. (May 28th.)

June 16th. Installation of electric lighting at the Hut Building, Pinewood, Wokingham. (June 4th.)

H.M. OFFICE OF WORKS.—June 14th. Incandescent electric lamps. (June 4th.)

BERMONDSEY.—July 15th. Borough Council. Electrical installation for lighting, heating, and power at the baths and washhouses, Grange Road. (See this issue.)

Lurgan.—June 21st. Urban District Council. Oil engines and generators, motor-driven pumps, main switchboard, and underground and overhead mains. (June 4th.)

Manchester.—July 7th. Electricity Department. Two 130,000-lb. water-tube boilers, flues, coal chutes, ash hoppers, pipework, valves, induced- and forced-draught plant and chimneys, one 40,000-kW turbo-alternator, with condensing plant, &c. (June 4th.)

July 5th. 33,000-V trunk feeders, pilot cables, and telephone cables. (See this issue.)

New Zealand.—AUCKLAND.—June 21st. Electric Power Board. L.p. insulators, &c.*

Public Works Department. July 20th. Phase transformer for Mangahao electric power scheme.*

New Zealand Railway Department. June 16th. Electric motors.*

August 30th. 400-V, 3-phase, slip-ring induction motors and starters.*

CHRISTCHURCH. — October 19th. Christchurch Drainage Board. Three sets of electric centrifugal pumping plants. (A.X. 3215.)*

WELLINGTON.—August 24th. Public Works Department. Synchronous condensers for the Waikaremoana Electric Power Scheme (BX 2608).*

Rhyl.—June 16th. Electricity Department. 1,000 yd. l.p. armoured cable, 1,915 yd. 11,000-V feeder cable, and switchgear equipment. (May 28th.)

South Africa.—June 21st. South African Railways and Harbours. Track bonds for the Cape Town Suburban Railway electrification scheme. (May 28th.)

July 8th. Telegraph material, poles, cross arms, &c. (A.X. 3173.)*

Ulverston.—Wiring High Carley Fever Hospital, for electric light installation. Mr. H. S. Pursey, consulting engineer, Electricity Department, Theatre Street, Ulverston.

Uruguay. — MONTEVIDEO. — July 6th. State Electricity Works. 1,000,000 metres of insulated conductors. (B.X. 2523.)*

July 9th. 137,500 metres of rubber-insulated wires and cables. (B.X. 2548.)*

40,000 metres of coloured twin conductor cords. (B.X. 2549.)*

July 22nd. 35,000 electric lamps.*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—MELBOURNE.—State Electricity Commission of Victoria. Accepted:—

Headworks, races, power-station buildings, &c., Sugarloaf-Rubicon hydro-electric scheme (approx. £155,083).—Sir W. G. Armstrong, Whitworth Pty., Ltd.

SYDNEY.—New South Wales Railways. Accepted:—

12 D.K. 55-h.p. traction motors (£4,307).—English Electric Co. of Australia, Ltd.

D.c. switchgear for St. Leonards and Hornsby sub-stations (£8,738).—Australian General Electric Co., Ltd.

—*Tenders.*

Belgium.—One Dutch, one British (Clark, Chapman and Co., Ltd., Gateshead), and five Belgian firms submitted tenders last week to the municipal authorities of Antwerp for the supply and erection of three electric cranes at the docks. The lowest offer was that of a Belgian concern.

Birkenhead.—Electricity Committee. Accepted:—

Cable.—Macintosh Cable Co., Ltd. (£2,648); W. T. Henley's Telegraph Works Co., Ltd. (£4,514); W. T. Glover & Co., Ltd. (£1,038).

500-kW rotary converter (£2,440).—Metropolitan-Vickers Electrical Co., Ltd.

Bolton.—Tramways Committee. Accepted:—

870 tons of Sandberg silicon steel tram rails.—Cargo Fleet Iron Co., Ltd.

Electricity Committee. Accepted:—

Steam meter.—Geo. Kent, Ltd.

Bradford.—Great Horton Industrial Society. Accepted:—

Electrical equipment at new branch stores.—Sackville Electrical Co.

Tramways Committee. Accepted:—

Six miles of round copper trolley wire (£569).—British Insulated Cables, Ltd.

75 tons of round mild steel (£694).—Whitehead Iron & Steel Co., Ltd.

Bury.—The Town Council has entered into an agreement with the Lancashire Dynamo & Motor Co., Ltd., in connection with the supply of the necessary plant for the change-over from direct to alternating current at Mossfield Mills.

Doncaster.—Electricity and Tramways Sub-Committee. Recommended:—

1,000-kW motor-converter and switchgear (£5,295).—Bruce Peebles & Co., Ltd.

Eastbourne.—Electricity Committee. Recommended:—

Feeder switch cubicles (£191).—Switchgear & Cowans, Ltd.

Fleetwood.—Corporation. Accepted:—

2,000-kW turbo-generator, one 20,000-lb. boiler, and the auxiliary plant.—J. Howden & Co., Ltd.

Glasgow.—

Electric lighting installation in connection with the restoration of West U.F. Church, Helensburgh.—Haddow & Co., Ltd.

Halifax.—Accepted:—

Wiring for electric lighting Corporation houses: Nursery Lane site (£200), Boothtown site (£200).—A. Higginbotham & Sons.

Hull.—Telephones Committee.

Silicum bronze wire:—

R. Johnson & Nephew, Ltd.	£428
British Insulated Cables, Ltd.	407
General Electric Co., Ltd.	419
T. Bolton & Sons. (Accepted.)	**382**
F. Smith & Co.	405
W. F. Dennis & Co.	359

Switchboards:—

Peel-Conner Telephone Works	173
Standard Telephones & Cables, Ltd.	189
British L. M. Ericsson Mfg. Co., Ltd.	162
Sterling Telephone & Electric Co., Ltd. (Accepted.) ...	**158**
J. McMillan & Co.	191

Ilford.—The Urban District Council has accepted the tender of the Metropolitan-Vickers Electrical Co., Ltd., for a 1,000-kW La Cour motor converter (600 revs. per min.) for £3,377, including specified spares. The Electricity Committee reported that it had received nine tenders from six firms. Particulars of four of these tenders were printed in the Council agenda, but the details were for some reason or other blacked out. It is reported that the committee recommended the acceptance of the tender of a Belgian company at between £300 and £400 less than the British offer, but this recommendation was not endorsed by the Council. We think that the blacking out of the particulars of tenders calls for some explanation. Councils or Library Committees sometimes think it their duty to black out betting news or matter not calculated to promote public morality, but is information relating to prices for public contracts to be placed in that category? A correspondent informs us that among the unsuccessful tenders were offers at £5,293 by the General Electric Co., Ltd., at £4,469 by Bruce Peebles & Co., Ltd., and at £3,000 by the Ateliers de Constructions Electriques de Charleroi.

India.—With further reference to our note on page 838 of last week's issue, *Indian Engineering* states that the contract received by the General Electric Co. (India), Ltd., for the complete equipment of a new power house for the East Indian Railway at Lucknow consists of:—Four 600-kW alternators; two Belliss engines for driving two of the above alternators; one 300-kW Belliss engine and alternator; one 12-panel h.p. switchboard; one l.p. switchboard; two 150-kW transformers, with condensing plant and other accessories. The value of the whole order amounts approximately to £22,000.

Leeds.—Electricity Committee. Accepted:—

Cable.—W. T. Henley's Telegraph Works Co., Ltd. (£5,135); Macintosh Cable Co., Ltd. (£3,516); Enfield Cable Works, Ltd. (£1,224); Hackbridge Cable Co., Ltd. (£1,095).

Leicester.—By 31 votes to 21 the City Council has accepted the tender of the Oerlikon Co., Zurich, for a 15,000-kW turbo-alternator at a cost of £28,000, rejecting an amendment that the lowest British tender be accepted. The debate was a keen one, and aroused some feeling. Councillor A. H. Swain, the chairman of the Electricity Committee, moving the adoption of the report, explained that ten tenders were received, eight being from British firms and two from Swiss manufacturers. He said that an examination of the British tenders "revealed the remarkable absence of free competition, while subsequent events proved that the prices were fixed by a combination of British manufacturers." The best two British tenders showed the minute difference of £50 per annum in the cost of producing 50 million units of electricity. The best tender was at £47,400, and an annual working cost of £16,035. The next was from the British Thomson-Houston Co., Ltd., at £45,761, and an annual cost of £16,035. The Swiss firm's price was £28,000, and the annual working cost £14,700. Calculated over 20 years, the period allowed by the Electricity Commissioners for the cost, the Swiss tender meant a saving of £46,100. Mr. Swain added that two further machines would have to be purchased during the next two or three years, so that had to be taken into consideration. As the Committee was anxious to give the work to British firms if it could, it took the step of permitting the British tenderers to reconsider their figures, and the matter was discussed with the British Electrical and Allied Manufacturers' Association. The principal points urged by the opposition were that the acceptance of the Swiss tender would tend to increase unemployment in this country and would seriously damage the prestige of British manufacturers. An attempt was made, without success, to secure the appointment of a special committee to go into the whole subject again.

Leigh.—Corporation. Accepted:—

One 750-kW rotary-converting plant.—Electric Construction Co., Ltd.

Maidenhead.—Town Council. Accepted:—

Extension of the h.p. switchboard (£315).—British Thomson-Houston Co., Ltd.

Plymouth.—Electricity Committee. Accepted:—

Transformers.—Metropolitan-Vickers Electrical Co., Ltd.

Meters.—Ferranti, Ltd., and Metropolitan-Vickers Electrical Co., Ltd.

Reigate.—Town Council. Accepted:—

H.p. switchboard, &c. (£1,739).—General Electric Co., Ltd.

Seaham Harbour.—Urban Council.

The following tenders were accepted in connection with the electricity scheme:—

Overhead line and l.p. switchgear.—Gray Bros.

H.p. cable.—F. Reid Ferens & Co.

H.p. switchgear.—Watson-Norie, Ltd.

Wiring houses on the Carr House site.—Harrison Bros.

Sheffield.—Tramways Committee. Accepted:—

1,000 tons of steel rails (£10 12s. 6d. per ton).—Steel, Peech & Tozer.

1,000 pairs of fishplates, at 16s. 6d. per cwt.; 250 pairs, at 12s. 6d. per cwt.; and 1,000 sole plates, at 12s. per cwt.—Cammell, Laird & Co.

19 tons of mild steel bars (15s. 6d. per cwt.).—Hadfields, Ltd.

Copper bonds.—British Insulated Cables, Ltd.; T. Bolton & Sons, Ltd.

4⅛ miles bronze trolley wire.—T. Bolton & Sons, Ltd.

Electricity Committee. Accepted:—

750-kW automatically-operated traction sub-station equipment (£3,753).—English Electric Co., Ltd.

Two 500-kVA Scott-connected sets; one 250-kVA set; six 150-kVA 3-phase transformers; and twelve 100-kVA single-phase transformers (£4,013).—British Electric Transformer Co., Ltd.

Steam-operated air ejector, &c. (£520).—English Electric Co., Ltd.

South Africa.—JOHANNESBURG.—Union Tender Board. Accepted:—

Telegraph material.—Standard Telephones & Cables, Ltd.; H. Davies and Co., Ltd.

Municipal Council. Accepted:—

25 miles h.d. bare aluminium wire (£227).—Saaler & Franks, Ltd.

2½ miles twin cable (£242).—J. C. Ferguson.

Current transformers (£356).—Metropolitan-Vickers Electrical Co., Ltd.

Fifty 50-h.p. tramcar motors and spares (motors by Westinghouse Electric and Manufacturing Co.) (£8,219).—Paul Gregson, Urquhart & Co.

DURBAN.—Municipal Council.

5 tons bare copper wire (£407).—T. Barlow & Sons, Ltd.

1 mile 3 core h.p. cable (£387).—Bartle & Co., Ltd.

1 mile twin h.p. cable (£164).—W. T. Henley's (S.A.) Telegraph Works Co., Ltd.

8 sets Merz-Price protective gear for sub-stations (£339).—Metropolitan-Vickers Electrical Co., Ltd.

—*South African Engineer.*

Stockton-on-Tees.—Electricity Department. Accepted:—Material for 12 months:—

L.p. cables.—W. T. Glover & Co., Ltd.

H.p. cables.—British Insulated Cables, Ltd.

A.c. meters.—Metropolitan-Vickers Electrical Co., Ltd.; Ferranti, Ltd.

House-service cut-outs.—W. T. Henley's Telegraph Works Co., Ltd.

Stoke-on-Trent.—Electricity Committee. Accepted:—

Circulating pump (£376).—Mather & Platt, Ltd.

Forthcoming Events.

Physical Society of London.—Friday, June 11th. At the Imperial College of Science, South Kensington, S.W. At 5 p.m. Ordinary meeting.

Salford Technical and Engineering Society.—Saturday, June 12th. Visit to the works of Messrs. Ferranti, Ltd., Hollinwood.

Faraday Society.—Monday, June 14th. At the Institution of Mechanical Engineers, Storey's Gate, S.W. At 2.30 p.m. Discussion on "Explosive Reactions in Gaseous Media."

Royal Institution of Great Britain.—Friday, June 14th. At 21, Albemarle Street, S.W. At 9 p.m. Lecture on "The Spectrum of the Aurora," by Prof. J. C. McLennan, F.R.S.

Incorporated Municipal Electrical Association.—June 14th to 19th. At Glasgow. Annual convention.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

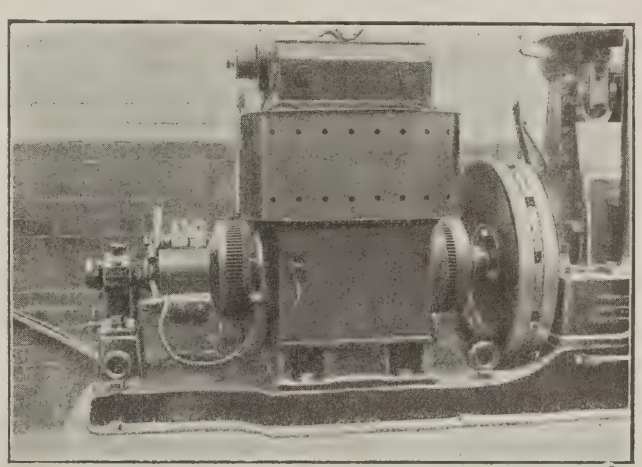
We should be glad to learn the names and addresses of makers of the following:—

STORA GEYSER electric water heater.
I.T.E. circuit breaker.

Notes.

The Electrical Engineers' Ball.—We are pleased to learn from the secretaries of the Electrical Engineers' Ball (Messrs. A. M. Sillar and W. S. Lonsdale), that owing to the great success of the Ball held on February 12th last, the Committee at a general meeting on June 3rd was able to distribute out of the surplus fund the sum of £65 each to the Institution of Electrical Engineers' Benevolent Fund and the Electrical Trades' Benevolent Institution. It will be remembered that with the Ball of 1925 the twenty-first anniversary of the event was celebrated, and it is very gratifying to be able to record that the total amount distributed to electrical engineering benevolence since the beginning has reached £1,280.

Board of Trade Committee on Patents.—The Board of Trade has appointed a Committee consisting of Mr. J. Whitehead, K.C. (chairman), Mr. H. A. Gill, M.A., Mr. A. J. Martin, O.B.E., Major-General Sir Philip Nash, K.C.M.G., C.B., and Mr. J. Swinburne, M.Inst.C.E., F.R.S., to inquire into and report whether any, and if so, what change is desirable in the practice of the United Kingdom of (*a*) dating and sealing patents applied for under Section 91 of the Patents Acts, 1907 and 1919, as of the date of the application in the foreign State; (*b*) dating and sealing other patents as of the date of application, as provided by Section 13 of the Acts. The Secretary to the Committee is Mr. B. G. Crewe, Patent Office, 25, Southampton Buildings, London, W.C.2, to whom all communications relating to the work of the Committee should be addressed.



Electricity in Agriculture.—In France, according to *The Implement and Machinery Review*, the Department of Agriculture is giving particular attention to rural electrification, which is expected to serve the double purpose of attracting labourers to the farm and of supplying agriculturalists with a cheap and convenient form of motive power for all their farm operations. At the recent agricultural show in Paris, for example, there was held a series of conferences on the employment of electricity for ploughing and for other work, the object being to encourage husbandmen to use machinery wherever it may permit of increased production, and to convince the farmer of the economies to be realised with the aid of electricity. Lectures are being given in schools and elsewhere upon the practical side of electricity for farm work, with the idea of creating an interest amongst young people in electrical equipment.

The Department of Agriculture has instituted an inquiry into rural electrification with the view of ascertaining exactly what it is still possible to do. The work has been entrusted to an expert in each department, and in the Isère, which is the great centre of hydro-electrical distribution, a particularly interesting report has been prepared showing that out of the 564 communes no fewer than 480 are already being electrified. So great is the demand for electric power that in some of the mountainous districts a number of villages are defraying the cost of installation. The motors employed for farm machinery, such as chaff cutters, root pulpers, circular saws and pumps, range from 2 to 3 h.p. In the mountainous regions each farmer usually has his own thrashing machine, contrary to the usual practice in the agricultural districts where thrashing is more often done by contract. The power of the motors is from 4 to 5 h.p. Obviously, they must be employed for other purposes besides the thrashing of grain. It is reported that in the Isère the employment of small thrashing machines is increasing, apparently on account of the facilities offered for driving them electrically. As giving some idea of the cost of electric current supplied to farmers it may be mentioned that one company charges 60 centimes per kilowatt-hour, with an annual minimum of 60 francs per kilowatt.

Strike News in America.—A report by Sir Philip Gibbs on the electrical situation in London during the recent general strike, which is commented on and abstracted in the *Electrical World*, appears to rather exaggerate the facts of the case. The report suggests that in nineteen power stations in the metropolitan district the "crews" came out on strike and were replaced by men from warships. This does not harmonise with our own information, which is to the effect that in only a few cases were naval men employed, and these were obtained by the request of the undertakings concerned. In the majority of the stations independent volunteers were employed. It must also be understood that "crews" cannot mean the whole personnel of the stations; the technical staffs in all cases remained loyal to their undertakings and supervised the volunteers and naval ratings, and in some instances the whole of the manual workers did not strike.

Illumination Research.—A pamphlet on "Illumination Research" has recently been issued by the Department of Scientific and Industrial Research, and gives an indication of the wide range of the investigations on the proper utilisation of natural and artificial light which the department is conducting under the supervision of its Illumination Research Committee. Such matters as the relation between illumination and speed and accuracy of work in the printing and other trades; the design of reflectors; the access of daylight in picture galleries; and the effect of colour, distribution of light, and "flicker" on ease of work are being considered. In view of the enormous amount which is being spent annually in this country on lighting, the need for experiments in order to ascertain the best methods of using light and to encourage true methods of economy is evident. Good lighting is a subject of interest to the whole community, and there is no one who is not to some extent dependent upon it in his daily work. Copies of the pamphlet may be obtained from the above department, 16, Old Queen Street, Westminster, S.W.1.

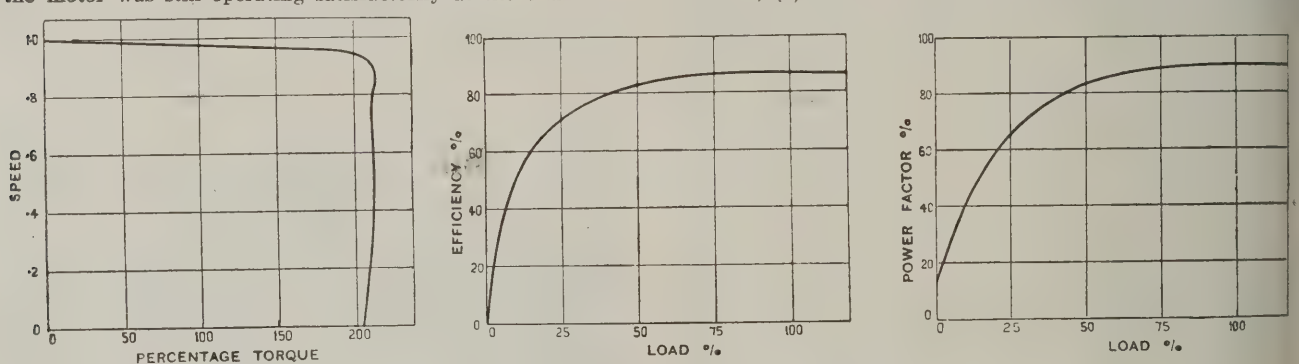
Old Dynamos at Dover.—The accompanying illustration shows a Brush "Falcon" dynamo that has been in regular use at the Dover Electricity Works for over 30 years, during which period the repairs cost has been nil. This and a similar machine were part of the original equipment installed by the Brush Electrical Engineering Co., Ltd., and were designed by Mr. E. Kilburn Scott, M.I.E.E. The machine is rated at 190 A, 65 V, 250 r.p.m., and the following particulars of design, taken from the test sheet dated December, 1894, may be of interest to designers of to-day. The armature core is 12 in. in diameter and 18½ in. long; it is wound with 176 conductors, each 0.138 in. by 5 in., connected at the ends with copper strips 0.025 in. thick, shaped in a volute to pack closely. The commutator has 88 segments. The shunt winding has 2,368 turns of 0.127-in. double-cotton-covered wire, eight turns of 1-in. by 0.25-in. wire comprising the series winding. The swivel bearing has two endless chains which were introduced as the result of experiments by Mr. Scott after seeing some Mohler bearings which were lubricated by a ring cut on the shaft. A swivel bearing with loose rings looked so clumsy that it was decided to use endless chains.

An Early "Brush" Dynamo at Dover.

The idea of using planished steel to protect the field coils came from Mr. Raworth, who designed the driving engine, which is fitted with electrical governors. The catalogue of these machines shows a range from 11 kW at 1,200 r.p.m. to 270 kW at 460 r.p.m., and it is interesting to know that these two sizes were priced at £110 and £990 respectively.

The Electrical Disturbances in Nerves.—According to *Science*, Dr. Adrian, of Cambridge University, has, by means of new radio apparatus, been able to obtain for the first time records on a rapidly-moving photographic plate of the electrical disturbance caused in a nerve fibre by the passing of messages down the nerve. The experiment was undertaken on a frog and it was found possible by stretching a muscle to stimulate a single nerve fibre. The impulses were all of the same size, but as the muscle was stretched, their frequency was increased from ten to fifty per second. The results of this experiment have opened up a new field of neurology, and no doubt they will hasten forward the time when it will be possible to read the types of messages entering and leaving the nervous system.

Silvanus Thompson Memorial Lecture.—The new date of this event has been fixed for Monday, June 28th, when Mr. C. A. Darling will lecture on "The Rise of Atomic Physics" with experiments, in the Dr. Thompson Lecture Theatre at Finsbury Technical College, Leonard Street, E.C.2. The chair will be taken by Mr. Llewellyn B. Atkinson at 8.0 p.m. Admission free by ticket only which can be obtained from Mr. R. O. Grant, c/o Messrs. Bloxam & Scuffels, Ltd., Engineers, 30, Bedford Row, W.C.1.



Earthing Resistances for Alternator Protection.—CORRECTIONS.—In connection with the article on this subject by Mr. B. Nuttall which appeared on pp. 822-4 of our last issue, the following corrections should be made:—Author's title, for A.M.I.E.E. read A.A.I.E.E.; in table on p. 824, for I/I read I/I_e; seventh line below the same table, for I read I_e.

Fuel Economy.—At a Council meeting of the Institution of Fuel Economy Engineers, held in London on May 28th, it was decided that the following observations be forwarded to the hon. secretary of the proposed Institute of Fuel Technology :—

"The Council is unanimously of the opinion that professional qualification for full membership of a national fuel Institution is vital for the existence of such an Institution as an authoritative body on this essential industrial problem. For this reason the question of any merger must stand aside until you have finally decided upon your constitution. The Council hopes that on fuller consideration you may revise your present opinion on this essential point."

At the same meeting further applications for membership were passed, and the Council was pleased with the high status of many of the new members. Definite plans are now in hand for organising the autumn session, and the full programme will be available for members in good time before the session starts. The secretary will be pleased to receive suggestions.

Metropolitan-Vickers C.K.B. Motor.—The curves reproduced below have been taken from a 10-h.p., 3-phase, 50-period motor running at 1,460 r.p.m. on 415 volts, and are striking testimony to the excellence of both the starting and running characteristics of this motor. The C.K.B. motor has an improved form of double squirrel-cage rotor, and the curves show that there is practically no sacrifice in running power factor, nor has there been any sacrifice of mechanical robustness to obtain these electrical results. A motor taken from stock was recently put on the test plate and given 720 reversals per hour over a period of eight months for a varying number of hours per day till it had accomplished over 1,000,000 reversals. At each reversal the blow delivered on the periphery of the rotor amounted to 320 lb. In spite of this severe treatment, during which the temperature of the rotor rose to 111 deg. C., the motor was still operating satisfactorily at the end of the test, and the slip and general performance remained unchanged. Careful resistance measurements showed that its electrical condition was precisely the same as at the start.

Metropolitan-Vickers "C.K.B." Motor Characteristic Curves.

An Electric-Steam Locomotive.—Mr. W. P. Durtnall draws attention in *Commercial Motor* to the "Paragon" heat transformer he has devised with which experiments are said to have been successfully concluded on a standard six-wheel coupled goods locomotive, as a result of which it is claimed that the thermo-dynamic efficiency has been raised from 5 per cent. to nearly 20 per cent. Mr. Durtnall claims the "Paragon" electric-steam locomotive to be an improvement enabling steam locomotives to operate on electrified railways with higher electric dynamic efficiency even than that of the ordinary types of electric locomotives. The new locomotives, when descending grades or stopping, will, it is stated, regenerate and return to the supply lines no less than 40 or 50 per cent. of the electrical energy consumed in ascending the same grades at the same speed and load.

Combined Coal and Electric Ovens.—Some particulars have reached us from Switzerland of what is known as a "combined oven." This oven employs both electricity and coal indifferently; it is of no special construction, and the usual baker's oven is suitable. In the oven itself, or in the masonry, special heating elements are placed. The elements are only switched on during the night periods when electricity in Switzerland is cheap, and the ovens are coal fired during the day. It is calculated that 20 kWh is consumed per sq. metre for a night's baking, which includes two batches of bread with the full supply on, and light pastry which is cooked by the residue heat after the second batch is removed, the supply being switched off.

Greenwich Observatory.—The annual visit to the Royal Observatory, Greenwich, by the president of the Royal Society and the other members of the Board of Visitors took place on June 6th, when the Astronomer Royal, Sir Frank Dyson, read his report. The gradual advance of the Southern Railway's electrified train service through New Cross and Lewisham has so interfered with observations of magnetic declination that such observations as are being taken are of little value. "The complete electric train service is expected to be working from the middle of July next," said Sir Frank, "and magnetic observations at Greenwich will then cease." The Observatory has established a new station at Abinger, in Surrey, where the work will be continued.

Appointments Vacant.—Instructor in electrical installation for the Kingston-on-Thames Technical Institute; deputy engineer (£600), for the Windsor Electrical Installation Co., Ltd., and the Slough and Datchet Electric Supply Co., Ltd. (See our advertisement pages to-day.)

The Electricity Bill.—The following letter appeared in *The Times* of June 3rd, and is referred to in our leading columns to-day :—In view of the resumption next Thursday of the consideration of the Electricity (Supply) Bill by the Committee of the House of Commons, we desire to point out that although the Government has agreed to make certain amendments with regard to the status of the proposed Central Electricity Board and to constitute a Tribunal of Appeal, the impression which is being encouraged that therefore all is well with the Bill is not in our view justified.

We are not opposed to the principle of standardisation and interconnection, but we are satisfied that the cost of general standardisation of frequency has been seriously underestimated by the technical advisers of the Government and could not be borne by the electricity supply industry without imposing a burden upon the users of electricity. We are anxious to support any measures that are calculated to spread the use of electricity, whether by reducing the cost to the consumer or in other ways, but we have very serious doubts whether the methods proposed by the Bill will achieve this end. On the contrary, a careful study of the Bill in its present form has forced upon us the conviction that its provisions are inimical to the economic development of electricity supply.

It would make this letter too long to specify in detail the further amendments we consider imperatively necessary—they are being put before the Parliamentary Committee. We will content ourselves with adding that the Bill, unless further amended, will tend: (1) to diminish efficiency by unnecessary interference with responsible management through duality of control; (2) to introduce further bureaucratic administration without financial responsibility; (3) to discourage enterprise, the terms of compulsory expropriation being unfair to investors, and the prospects of earning a fair return on capital being endangered.

We are, Sir,
Yours faithfully,

J. B. Braithwaite, Chairman, City of London Electric Lighting Company, Limited.
R. A. Chattock, President of the Institution of Electrical Engineers.
James Devonshire, Chairman, North Metropolitan Electric Power Supply Company.
E. Garcke, Chairman, Shropshire, Worcestershire and Staffordshire Electric Power Company.
J. S. Highfield, Consulting Engineer to South Wales and Cornwall Electric Power Companies.
R. P. Sloan, President, Incorporated Association of Electric Power Companies.
C. G. Tegetmeier, Chairman of seven Electricity Supply Companies.
P. D. Tuckett, Chairman, Edmundsons Electricity Supply Corporation, Limited, and Cornwall Electric Power Company.
W. B. Woodhouse, General Manager and Chief Engineer, Yorkshire Electric Power Company.

Lubricating Oils for Heavy-Oil Engines.—At a meeting of the Diesel Engine Users' Association on May 28th the President, Mr. E. W. Johnston, gave an account of the work which had been done by the Committee in connection with the preparation of specifications for lubricating oils for heavy-oil engines, which it was proposed that the Association should adopt, in the hope that they would be used by the members. Following independent analyses of a considerable number of lubricating oils used by its members, and with the assistance of a well-known analytical chemist and authority, the Association's Committee has prepared two specifications which embody characteristics which will ensure first-class lubricants without including any highly expensive features and which it will be practicable for the great majority of oil suppliers to provide without difficulty. At the conclusion of the investigations the Committee invited representatives of the principal suppliers in the country to express their opinions on the specifications, described as "A" and "B," adopted for lubricating oils for 2- and 4-stroke cycle heavy-oil engines, the first being for engines of speeds from 100 to 240 r.p.m., and the second for engines of speeds above 240 r.p.m.

Broadcasting during the Strike.—The absence of newspapers during the recent general strike added much value to the augmented news service which was maintained by the British Broadcasting Co.'s stations; in this connection it is of interest to record that the Radi-Arc Electrical Co., Ltd., was requested by the Government to install a "Liberty" 8-valve supersonic heterodyne receiver on the Horse Guards parade ground, operating two large loud-speakers, so that the Government news bulletins could be broadcast to the general public.

Strike Items.—At Edinburgh during the recent general strike most of the manual workers in the generating station and sub-stations left their posts. The supply was maintained by the technical staff, with the assistance of volunteers from the Heriot Watt College and local engineering firms; 589 employés left work and 94 volunteers were engaged. During the early part of the strike it was thought desirable to ask certain large consumers to curtail their consumption, but as things became better organised, this request was modified.

All the employés of the Greenock Electricity Department remained loyal, and no interference with, or curtailment of, the supply took place. Since the commencement of the coal dispute the undertaking has been using oil-fuel-burning equipment, with which many of the boilers were fitted during the 1921 coal strike.

A normal full supply was maintained at Blackburn, although a very large proportion of the employés at the main generating and distributing stations left work without notice. The station technical staff was assisted by members from the other departments.

A Local Lecture.—At a meeting of the Gosport Rotary Club on May 27th, when Mr. W. A. Homewood presided, Capt. W. H. Upton Marshall, M.I.E.E., delivered a lecture dealing with the electricity supply industry in this country. He outlined the advances which had been made during the past 20 years, and referred to the legislation which had been passed to ensure an adequate supply of electricity to all consumers. Referring to the recent proposals for shutting down the inefficient stations and interconnecting the large ones, he said that in the London and Home Counties alone some 500,000 tons of coal could be saved annually as the result of such reorganisation.

Institution Notes.

Institution of Electrical Engineers.—MERSEY AND NORTH WALES (LIVERPOOL) CENTRE.—The Committee's annual report for the 1925-26 session shows that eight committee meetings were held and six ordinary meetings, at which the average attendance was 98, excluding the attendance at the Faraday lecture. The number present at the annual dinner was 76; the reunion with the North-Western Centre which was to have taken place at Chester in May had to be postponed. The membership remains the same as last year, 467, and the number transferred to other districts, or removed from the list, was 89, as compared with 73 in the previous year. The total expenses of the session amounted to £283, including the Students' Section total of £17, which section is in a more thriving condition. The 1926-27 Committee is as follows:—*Chairman*: P. J. Robinson; *vice-chairmen*: Prof. F. J. Teago and S. E. Britton; *ordinary members*: A. G. Barnard, L. Breach, T. Cornfoot, H. Dickinson, P. M. Hogg, Prof. E. W. Marchant, T. B. Morgan, E. L. Morland, G. H. Nisbett, A. J. Pratt, P. Priestly, and A. S. Wilson.

The Faraday Society.—ANNUAL MEETING.—At the annual meeting on June 2nd, Prof. F. G. Donnan, F.R.S. (president), referred to the loss which the Society had sustained by the sudden and lamentable death of Mr. F. S. Spiers, the secretary of the Society, and also of the Institute of Physics. Mr. Spiers, he said, was practically the Faraday Society, and but for the work which he had done from the very beginning the Society would probably not now be in existence. The meeting marked its sense of the loss the Society had sustained by standing in silence.

The annual report of the Council for 1925 shows that 30 new members were elected during the year, and at the end of the year the membership was 426 members and 6 students, as against 416 members and 9 students in 1924. Regret is expressed that the membership is growing at such a slow rate, although there is a growing increase, from all over the world, in the sales of the *Transactions* to non-members. Reference is also made in the report to the formation of the Electroplaters' and Depositors' Technical Society during the year; the original idea was to form an electroplaters' section of the Faraday Society, but this was not thought desirable on general grounds, and as it was also found that a Plating Section would not serve the purpose in view, the new Society was formed practically under the wing of the Faraday Society. Prof. Donnan expressed the hope that there would be co-operation in every way between the two societies. The financial position at the end of 1925 was a debit balance of £187 due to commitments in the past, there being an actual excess of income over expenditure during 1925 of £332. By restricting the number of general discussions, for which the Society has achieved quite a reputation, to two per annum a considerable reduction in the expenditure is contemplated and, indeed, this is one of the reasons for the more satisfactory position at the end of 1925. On the other hand, it is intended to issue the *Transactions* bi-monthly in future, instead of three times per annum as in the past.

The report and accounts were adopted, the president expressing the hope that the membership would increase materially.

Prof. C. H. Desch, F.R.S. (Head of the Metallurgical Department of Sheffield University), was elected president for the coming year in succession to Prof. Donnan.

Prof. F. G. Donnan then delivered his presidential address, which consisted of an account of work done by himself and Prof. T. Thorvaldsen when they were both at Liverpool in 1912-13 upon electrical potential differences at air-water surfaces. This is the first time an account of this work has been given, the delay being due, in the first instance, to the fact that Prof. Donnan removed to London and Prof. Thorvaldsen took up a post in Saskatchewan, and then to the war period preventing publication. Subsequently Prof. Donnan wrote to Prof. Thorvaldsen to send his notes and documents over. These did not arrive until comparatively recently, hence the delay. The work dealt with the position as it stood in 1912 and 1913, although other workers had carried matters further since; it concerned the measurement of electric potential differences in thin films of liquid, a subject of great interest to colloid chemists. It was claimed that they established for the first time that electrical potential differences at air-water surfaces varied with the concentration of the substances and with the surface tension of the liquid.

Institute of Wireless Technology.—EXAMINATION.—We have received a copy of the regulations relating to the examination of candidates for membership of the Institute, together with application forms. The next examination will be held in October, and applications should reach Mr. Y. W. P. Evans, hon. secretary, 71, Kingsway, London, W.C.2, not later than August for Great Britain, and a month earlier for foreign candidates.

Institution of Heating and Ventilating Engineers.—SUMMER MEETING.—The summer meeting will take place at Scarborough from June 21st to 23rd.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

According to a *Reuter* report from Montreal, Mr. A. E. POLLARD, of the Department of Overseas Trade in London, has been appointed British Trade Commissioner in Vancouver in succession to Mr. L. S. BEALE, who has been transferred to New Zealand.

Mr. P. H. RIGGS has resigned his position of Scottish representative of Messrs. Richard Garrett & Sons, Ltd., Leiston, to join the Alton Battery Co., Ltd., Alton, Hants., as London representative.

Mr. CHARLES PARCELL, employed by the Liverpool Corporation Electricity Department as leading fitter, has been appointed assistant engineer in the electricity supply department (salary £300 per annum).

The Belfast City Council last week approved the recommendation of the Electricity Committee to send the City electrical engineer and manager (Mr. JOHNSTONE WRIGHT) to the United States to study electricity supply development in that country in general, but in particular power-station boiler-house practice and equipments utilising pulverised fuel, &c.

Mr. J. SIMS, assistant electrician at Broxburn Oil Works, has been appointed resident electrical engineer by Grange-over-Sands Council.

Mr. F. H. BLAXLEY, of Dovedale, Penns Lane, Erdington, Birmingham (late of the New Gutta-Percha Co.), has just been appointed Midlands representative of the Walsall Hardware Manufacturing Co., Ltd.

To fill the vacancy caused by the death of Mr. C. H. FRYER, Mr. W. H. SCAGELL, who for many years represented Messrs. Houghtons, Ltd., in Scotland and the north of Ireland, has now been appointed manager of their Glasgow depot at 70-78, York Street.

An Australian newspaper report states that Mr. JAMES CLARKE, sales manager of Standard Telephones and Cables (Australasia), Ltd., left on April 28th for England, the Continent, and the U.S.A. to study the latest methods of telephone manufacturing organisations, with the object of applying them to the Australian concern on his return there at the end of the year. It is remarked that the Company will be manufacturing telephone parts in Australia in the near future.

Last week the Halifax Town Council, by 22 votes to 20, adopted the Electricity Committee's recommendation that the salary of the borough electrical engineer be increased from £1,140 to £1,200.

Obituary.—MR. ROBERT TAYLOR.—We briefly mentioned last week the death of Mr. Robert Taylor, at the age of 71 years. The funeral took place at Manchester on May 21st (which date was given last week as that of his death). Mr. Taylor, who was the founder and a director for 25 years of the Liverpool Electric Cable Co., Ltd., had a long and interesting career in the cable manufacturing business, having been connected with its growth from the earliest stages. He was born at North Woolwich in 1855, and started work at the age of 10½ years. After a few months he got work with the India Rubber, Gutta Percha, &c., Co., on the winding of jute yarns for certain sub-

marine cable work, and in the coiling tanks, and then when the order was finished he went to W. T. Henley's galvanising shop, where he remained until he was about 14 years of age. At that time there were no Factory Acts, and boys could be worked overtime and at night; they worked alternate weeks, day and night shifts, each being for 12 hours. In some notes left by Mr. Taylor he says :—" No mealtimes were allowed so that we had to take food as best we could. It frequently happened that one's relief did not turn up so that we had to do a 36-hour shift. It is interesting to remember this when we think of the present-day conditions in the factory." He left the galvanising department on account of the fumes affecting his throat, and found a post again at the India Rubber, Gutta Percha, &c., Works. After a few months coiling in the tanks he was moved into the telegraph shop, where submarine cables were being insulated with vulcanised rubber. A fire destroyed the cable shop and in the course of other changes Mr. Taylor once again returned to Henley's, where he stayed until the end of 1872, and, after the troubled period, the foundation of the present prosperous business of W. T. Henley's Telegraph Works Co. was laid, with Mr. (now Sir) George Sutton as secretary. Towards the end of 1882 Mr. Taylor left Henley's and introduced the manufacture of vulcanised rubber cables to Johnson & Phillips, remaining there 5½ years. He then joined the Telegraph Manufacturing Company, Helsby, and commenced to manufacture rubber cables. Two years later he introduced to W. T. Glover & Co. the manufacture of rubber cables and took charge of the factory as works manager. After eleven years with Glover's, Mr. Taylor resigned and along with his son, Mr. W. S. Taylor, and the late Mr. Samuel Hartford, established the Liverpool Electric Cable Co., Ltd. Mr. Taylor was of a very reserved disposition, but he was well known to electrical men of an earlier generation. Of late years he was not able to take the place in the industry that he would have liked to occupy.

MR. F. C. OSBORNE.—The death occurred suddenly on May 25th of Mr. Frederick Charles Osborne, who was an engineer at the Colchester Borough Electricity Works. He was 53 years of age.

MR. W. T. EDWARDS.—The death took place as the result of a motoring accident at Brixworth, Northants, on May 30th, of Mr. William Thomas Edwards, who was partner with his father in the firm of Herbert Edwards & Son, radio engineers, of Clapham Park Road, London, S.W. Deceased was 22 years of age.

MR. W. P. THOMPSON.—We regret to learn from the columns of the *Mechanical World* that the death occurred on May 25th of Mr. William Phillips Thompson, patent agent, Liverpool. Mr. Thompson founded the firm of W. P. Thompson & Co., chartered patent agents, at Nottingham, in the early seventies of last century; he then opened at Liverpool, with, later, branches in Bradford and London.

MR. E. WARREN.—The death occurred on May 27th, at the age of 39 years, of Mr. Ernest Warren, who was engaged in the business of his father, Mr. W. H. Warren, electrical and radio engineer, High Street, Huntingdon. During the war he served in the electrical department of the Royal Engineers in German East Africa, and was in charge of the wireless apparatus.

New Companies Registered.

Mota Signs, Ltd. (214,053).—Private company. Registered May 31st. Capital, £250 in £1 shares. Objects: To carry on the business of dealers in all kinds of goods, apparatus and devices relating to electric or automatic signs for commercial advertising, &c. The first directors are:—S. Hamaguchi, 1, St. John's Wood Park, Hampstead, N.W.; Ivy P. Weaver, 1, Bisson Road, Stratford, E.15; J. T. Magee, 36, Leigh Road, Highbury; A. E. Weaver, 1, Bisson Road, Stratford, E.15 (all permanent, subject to each holding 10 shares). Qualification of ordinary directors, 5 shares. Registered office: 54, Gracechurch Street, E.C.3.

William Simms & Co. (Felixstowe), Ltd. (214,072).—Private company. Registered May 31st. Capital, £4,000 in £10 shares. Objects: To acquire the business of electrical engineers and contractors carried on by W. Simms and C. W. Barker at Felixstowe and elsewhere as " William Simms & Company. The directors are:—W. Simms, 2, York Road, Felixstowe, electrical engineer; C. W. Barker, " Binfield," Manning Road, Felixstowe, electrical engineer; C. R. Simms, 2, York Road, Felixstowe, electrical engineer. Qualification, 1 share. Solicitors: Kersey & Tempest, 15, Tower Street, Ipswich. Registered office: 92, Hamilton Road, Felixstowe.

Kemps Mills, Ltd. (214,040).—Private company. Registered May 29th. Capital, £100 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in radio apparatus and electrical materials of all kinds, manufacturers of and dealers in metals, engineers, metal workers, hardware merchants, &c. The subscribers (each with one share) are:—B. S. Bernstein, St. Hilary, Long Lane, West Kirby, Cheshire, manufacturer; E. J. Davenall, 48, Lea Road, Wolverhampton, radio engineer; A. G. Allen, 21, Legge Street, Parkfield, Wolverhampton, production engineer. The first directors are not named. Qualification, £1 share or stock. Secretary: F. E. Franks. Solicitor: F. W. Jackson, 57, Moorfields, Liverpool. Registered office: Pountney Place and Stewart Street, Wolverhampton.

W. Yuill & Co., Ltd. (24,165).—Private company. Registered in Edinburgh May 27th. Capital, £3,500 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in wireless sets, parts and appliances, optical and scientific instruments, pianofortes and musical instruments of all kinds, &c. The subscribers (each with one share) are:—W. Yuill, 20, Southern Avenue, Burnside, Glasgow, commercial traveller; A. Reid, Kilmory, High Road, Stevenson, Ayrshire, clerk. The first directors are not named. Qualification, 200 shares. Secretary: J. J. B. Gilmour, 83, Princes Street, Ardrossan.

McWhirr, Paterson & Co., Ltd. (214,065).—Private company. Registered May 31st. Capital, £1,000 in £1 shares. Objects: To acquire the loose stock, stock in trade and other goods and chattels (1) in connection with the business of McWhirr and Paterson, carried on by Mrs. J. D. Andrews at 20, Keen's Yard, St. Paul's Road, Highbury Corner, N.1, and (2) in connection with the business of George Paterson & Son (including the goodwill thereof) carried on by G. G. Paterson at 107, Clerkenwell Road, E.C., and to carry on the business of manufacturers of and dealers in screws, nuts, terminals, washers and all other wireless parts, components, accessories and sets for use for or in connection with the electrical and wireless trades, importers, exporters and manufacturers of brass parts, and fittings for builders, merchants, cabinet makers and general engineers, &c. The first directors are:—G. G. Paterson, 88, Belsize Lane, Hampstead, N.W.3, engineer; Mrs. J. D. Andrews, 43, Ilfracombe Road, Southend-on-Sea. Qualification, 1 share. Registered office: 7 and 8, Keen's Yard, St. Paul's Road, Highbury Corner, N.1.

Alphian Wireless, Ltd. (213,974).—Private company. Registered May 27th. Capital, £500 in £1 shares. Objects: To carry on the business of manufacturers of wireless sets and accessories, &c., and to adopt an agreement with Maude E. Adey. The permanent directors are:—H. O. H. Maude (chairman), 13, Rodney Court, Maida Vale, W.9; H. W. Adey, 10, Lambolle Road, Hampstead, N.W.3. Manager: H. W. Adey. Solicitors: Maude and Tunnicliffe, Arundel House, Arundel Street, W.C.2. Registered office: 99, Mortimer Street, W.1.

R. Falshaw, Ltd. (214,108).—Private company. Registered June 2nd. Capital, £5,000 in £1 shares. Objects: To acquire the business of an electrical engineer now carried on by R. Falshaw at 1, Albert Street, Harrogate, as " R. Falshaw," and to carry on the business of manufacturers of and dealers in wires, lamps, fittings, accumulators, batteries, dynamos, magnetos, indicators, bells, switches, controls, valves, telephonic and telegraphic instruments and apparatus, wireless goods, &c. The subscribers (each with one share) are:—R. Falshaw, The Lodge, Weeton, electrical engineer; Mrs. F. A. Falshaw, The Lodge, Weeton. R. Falshaw is first and permanent governing director and chairman. Qualification, £100 shares. Remuneration, £50 each per annum. Secretary: A. Depledge. Solicitors: Titley & Paver-Grow, Harrogate.

Official Returns of Electrical Companies.

Burndept Wireless, Ltd.—Charge on certain freehold and leasehold properties at Blackheath and Willesden, and the company's other assets, including uncalled capital, dated May 4th, 1926, to secure all moneys due or to become due from the company to Coutts & Co., not exceeding £100,000.

Frank Thornton, Ltd.—Agreement accompanying deposit of deeds dated May 11th, 1926, charged on garage and engineering works in Cannon Street, Burnley, with fixed plant, machinery, &c., to secure all moneys due or to become due from the company to Manchester and County Bank, Ltd.

Central Electric Supply Co., Ltd. (53,080).—Capital, £100,000 in £5 shares. Return dated March 9th, 1926. All shares taken up. £100,000 paid. Mortgages and charges, £1,300,000.

Kensington and Knightsbridge Electric Lighting Co., Ltd. (26,193).—Capital, £350,000 in 50,000 ordinary, 10,000 first preference, and 10,000 second preference shares of £5 each. Return dated April 1st, 1926. 21,000 ordinary, 10,000 first preference, and 10,000 second preference shares taken up. £179,840 paid on 15,968 ordinary, 10,000 first preference, and 10,000 second preference. £25,160 considered as paid on 5,032 ordinary. Mortgages and charges, £140,000. Ditto guaranteed by this company and the Notting Hill Electric Lighting Co., Ltd., under powers of the Kensington and Notting Hill Electric Lighting Co.'s Act, 1899, £300,000.

Oxford Electric Co., Ltd. (34,685).—Return dated March 24th, 1926. Capital at date of return, £175,000 in 20,000 ordinary and 15,000 preference shares of £5 each. 20,000 ordinary and 11,000 preference shares taken up. £121,000 paid on 13,200 ordinary and 11,000 preference, and a further £1,550 paid on 310 ordinary shares forfeited. £34,000 considered as paid on 6,800 ordinary. Mortgages and charges, £110,000. On March 26th, 1926, it was resolved (*a*) to split each existing £5 share into five of £1, (*b*) to increase interest on the cumulative preference shares from 5 per cent. to 6 per cent. as from June 30th, 1926, and (*c*) to increase the capital to £250,000 by creating 75,000 new 6 per cent. cumulative preference shares of £1 each.

Burma Electric Supply Co., Ltd. (till recently known as " Burmah Electric Tramways and Lighting Co., Ltd.") (75,090).—Capital, £250,000 in 100,000 ordinary and 150,000 preference shares of £1 each. Return dated December 16th, 1925. 100,000 ordinary and 120,000 preference shares taken up. £100,000 paid on 100,000 preference. £120,000 considered as paid on 100,000 ordinary and 20,000 preference. Mortgages and charges, nil.

Bogota Telephone Co., Ltd. (69,059).—Capital, £150,000 in 125,000 preferred and 25,000 deferred shares of £1 each. Amended return dated December 11th, 1925 (filed April 28th, 1926). 125,000 preferred and 18,607 deferred shares taken up. £131,107 paid on 125,000 preferred and 6,107 deferred. £12,500 considered as paid on 12,500 deferred. Mortgages and charges, nil.

Consolidated Signal Co., Ltd. (71,141).—Capital, £425,000 in 220,000 preference and 205,000 ordinary shares of £1 each. Return dated February 25th, 1926. 214,195 preference and 150,548 ordinary shares taken up. £52,839 paid on 24,999 preference and 27,840 ordinary. £311,904 considered as paid on 189,196 preference and 122,708 ordinary. Mortgages and charges, nil.

Bray, Markham & Reiss, Ltd. (74,871).—Capital, £20,000 in £1 shares. Return dated December 1st, 1925. 17,080 shares taken up. £16,080 paid. £1,000 considered as paid. Mortgages and charges, nil.

Lancashire United Transport and Power Co., Ltd. (till recently known as " Lancashire United Tramways, Ltd.") (87,044).—Capital, £200,000 in £1 shares. Return dated March 9th, 1926. 192,878 shares taken up. £7 paid. £192,871 considered as paid. Mortgages and charges, £546,500.* Deferred debenture stock issued having no charge over the company's assets, £83,330. (*A further £40,000 of this stock has been deposited as security for possible advances.)

Mansfield and District Tramways, Ltd. (91,130).—Capital, £180,000 in 80,000 preference and 100,000 ordinary shares of £1 each. Return dated March 8th, 1926. 80,000 preference and 44,834 ordinary shares taken up. £80,609 paid on 62,767 preference and 17,842 ordinary. £44,225 considered as paid on 17,233 preference and 26,992 ordinary. Mortgages and charges, £67,611.

London Electric Wire Co. & Smiths, Ltd. (101,353).—Capital, £1,250,000 in 750,000 ordinary and 500,000 preference shares of £1 each. Return dated April 14th, 1926. 644,070 ordinary and 400,000 preference shares taken up. £350,035 paid on 35 ordinary and 350,000 preference. £694,035 considered as paid on 644,035 ordinary and 50,000 preference. Mortgages and charges, nil.

Mather & Platt, Ltd. (60,387).—Capital, £2,500,000 in 40,000 preference shares of £10 each and 2,100,000 ordinary shares of £1 each. Return dated March 12th, 1926. 40,000 preference and 1,363,660 ordinary shares taken up. £630,660 paid on 29,200 preference and 338,660 ordinary. £1,333,000 considered as paid on 10,800 preference and 1,025,000 ordinary. Mortgages and charges, nil.

Clarke, Chapman & Co., Ltd. (39,045).—Capital, £550,000 in 7,000 preference shares of £10 and 480,000 ordinary shares of £1. Return dated March 19th, 1926. 6,985 preference and 444,060 ordinary shares taken up. £100,210 paid, being £10 on 4,435 preference, £1 per share on 55,360 ordinary, and 5s. per share on 2,000 ordinary shares. £413,700 considered as paid, being £10 per share on 2,550 preference, £1 per share on 386,700 ordinary, and 15s. per share on 2,000 ordinary shares. Mortgages and charges, nil.

Hindhead and District Electric Light Co., Ltd.—Issue on May 20th, 1926, of £50 debentures, part of a series already registered.

Reading Electric Supply Co., Ltd. (35,651).—Capital, £152,200 in £1 shares. Return dated April 29th, 1926. 152,125 shares taken up. £147,775 paid. 4,350 considered as paid. Mortgages and charges, £93,400.

Newmarket Electric Light Co., Ltd. (44,450).—Capital, £30,000 in £10 shares. Return dated May 3rd, 1926. 2,656 shares taken up. £26,560 paid. Mortgages and charges, £14,200.

New Phonopore Telephone Co., Ltd. (44,654).—Capital, £10,000 in 9,000 ordinary and 1,000 founders' shares of £1 each. Return dated, December 23rd, 1925. 7,141 ordinary and 1,000 founders' shares taken up. £6,781 paid on 6,741 ordinary, leaving £10 in arrears. £1,400 considered as paid on 400 ordinary and 1,000 founders'. Mortgages and charges, £2,566.

Electric Sign Co., Ltd. (45,610).—Capital, £5,000 in £1 shares. Return dated April 28th, 1926. 2,000 shares taken up. £1,000 paid. £1,000 considered as paid. Mortgages and charges, nil.

City and General Radio Co., Ltd.—Debenture dated April 6th, 1926, to secure £500, charged on the company's property, present and future, including uncalled capital. Holder: F. Featherstone, 79, Cannon Street, E.C.4.

Harrow Electric Light and Power Co., Ltd. (44,529).—Capital, £50,000 in 6,667 ordinary and 3,333 preference shares of £5 each. Return dated March 4th, 1926. All shares taken up. £50,000 paid. Mortgages and charges, £25,000.

Power and Lighting Supplies Co., Ltd. (174,477).—Capital, £5,000 in £1 shares. Return dated February 11th, 1926. 2,125 shares taken up. £500 paid. £1,625 considered as paid. Mortgages and charges, nil.

Reason Manufacturing Co., Ltd. (64,701).—Capital, £52,500 in 200,000 preference and 10,000 ordinary shares of 5s. each. Return dated December 30th, 1925. 92,000 preference and 10,000 ordinary shares taken up. £2,349 paid on 9,397 preference shares. £23,150 considered as paid on 82,603 preference and 10,000 ordinary shares. Mortgages and charges, £13,000.

British Electric Transformer Co., Ltd. (76,351).—Capital, £1,000,000 in 300,000 preference and 700,000 ordinary shares of £1 each. Return dated April 8th, 1926. 300,000 preference and 325,000 ordinary shares taken up. £539,821 paid on 290,776 preference and 249,045 ordinary shares. £85,179 considered as paid on the remainder. Mortgages and charges, £20,000.

Costa Rica Electric Light and Traction Co., Ltd. (56,447).—Capital, £130,000 in £1 shares. Return dated April 14th, 1926. All shares taken up. £7 paid. £129,993 considered as paid. Mortgages and charges, £282,150.

Dixon & Corbitt and R. S. Newall & Co., Ltd. (24,228).—Capital, £160,000 in £1 shares. Return dated April 8th, 1926. All shares taken up. £96,150 paid. £63,850 considered as paid. Mortgages and charges, nil.

Newcastle and District Electric Lighting Co., Ltd. (28,022).—Capital, £300,000 in £1 shares. Return dated April 2nd, 1926. All shares taken up. £300,000 paid. Mortgages and charges, £317,960.

Thames Valley Electric Supply Co., Ltd. (185,597).—Capital, £100 in £1 shares. Return dated April 29th, 1926. All shares taken up. £100 paid. Mortgages and charges, nil.

Continental Automatic Telephone and Electric Co., Ltd. (184,764).—Capital £10,000 in £1 shares. Return dated December 31st, 1925 (filed March 9th, 1926). 1,302 shares taken up. £302 paid. £1,000 considered as paid. Mortgages and charges, nil.

Gayton Park Electricity Co., Ltd. (184,208).—Capital, £3,000 in £1 shares. Return dated March 15th, 1926. All shares taken up. £3,000 considered as paid. Mortgages and charges, nil.

Sennybridge Electric Supply Co., Ltd. (174,920).—Capital, £1,500 in £25 shares. Return dated June 30th, 1925 (filed May 18th, 1926). 48 shares taken up. £1,200 paid. Mortgages and charges, nil.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Callender's Cable and Construction Co., Ltd.

The annual meeting was held on June 3rd, Sir J. Fortescue Flannery, Bart., M.Inst.C.E. (chairman of directors) presiding. After apologising for the delay in the holding of the meeting, due to the intervention of the General Strike, the chairman, in moving the adoption of the report and accounts (*vide* ELECTRICAL REVIEW, May 28th, p. 803), said that it was unnecessary to enlarge upon the General Strike, which was, happily, ended, but they had, unfortunately, still many troubles to overcome and much more work to do before the wheels of industry ran smoothly, but they were confident that that would, in due course, be accomplished. On the Tuesday morning following the declaration of the General Strike they were informed that their power would be cut off, and within an hour that took place. On endeavouring to start their afternoon shift they found all their plant and machinery dead, as the electrical energy had been deliberately cut off. It therefore became necessary to close the factory, and they were unsuccessful in endeavouring to obtain a supply until the following Tuesday, when a small supply was given them, which, however, on the termination of the strike, was immediately increased so as to meet their demands. Their workmen returned, and were given employment as far as possible. A large number of their men volunteered for various services, and in many cases the technical knowledge which they possessed was of great value to the community. Referring to the Electricity Bill, the chairman said that the uncertainty of the issue had had the effect of holding up the development of electrical enterprise in many directions. If the intentions of the promoters were realised and a substantial increase in the employment of electricity was rendered possible, it would undoubtedly mean an increase in the use of cables of all kinds. The directors were, however, of the opinion that the high expectations of immediate advantage which had been formed by the general public were greater than the future would justify. It seemed to be forgotten that in many of the large industrial areas of the country most of the objects of the Bill had already been fully attained by the power companies, and that in any event it would take some years before a substantial decrease in the cost of electricity to outlying areas and their consequent large development could take place. The method of linking up stations, and many other provisions of the Bill, were likely to be of great service to the community. In the meantime, however, the Bill had retarded progress. They hoped that progress would not be further hampered by the Bill being referred to committees to investigate all points. Regarding the report and accounts, the accounts submitted indicated a conspicuous advance. The company's prosperity was due very largely to the fact that it had always been in the forefront of the industry, by reason of new and improved machinery, the leadership of Sir T. O. Callender—supported by an excellent band of trained and willing workers—and the sound financial policy adopted. Keen competition existed, and although a very large business has been done, the profit on each individual item was relatively small. Large financial resources were necessary in order to carry on that ever-increasing business, and the nominal capital of the company was no guide whatever as to the sums which they had at their disposal and from which the profits and dividends resulted. It had sometimes been suggested that the company and some similar concerns were making unreasonably high profits, whereas that was far from being the case. The capital of the company had been increased by the creation of 200,000 ordinary shares, of which 100,000 were issued during the past year. Over 99 per cent. of that amount was subscribed by the shareholders direct in response to this invitation, and, of the remainder, somewhat less than 1,000 shares, applications for 86 times that amount were received from would-be subscribers. In making the allotments for those shares the directors gave special consideration to applications received from the employés. It was proposed to distribute by way of bonus £200,000 in fully paid-up ordinary shares to the present holders at the rate of one new share to every three now held. That would bring their book capital more in accord with the amount really employed in the business. To do that it would be necessary to increase the ordinary share capital, and the directors thought it desirable while doing so to take powers to make that issue larger than was at present required. The additional 200,000 was not to be offered for subscription at present, but it would be available when the increasing business and the fresh developments of the industry rendered it necessary to do so. The new shares would participate equally with the old shares in the final distribution of 10 per cent. The payments would be subject to income-tax at the rate of 3s. 11d. in the £. After adding the amount brought in from last year, there was a balance of £611,338, as against £462,664 brought in. As regarded the prospects for the current year, before the General Strike and present difficulties the directors had every reason to be satisfied with the outlook; but it was idle to deny that the convulsion which had shaken the industry of the country must have had its effect upon operations. Provided, however, that the troubles were cleared away in a satisfactory manner, the shareholders could expect with reasonable confidence the continuance of the same dividend even on the enlarged capital. The company had extended its operations in several parts of the world. The Okonite-Callender Cable Co. in the United States, whose works were now in regular operation, was producing cables of the same type as those which the company manufactured in England, for which there was a large demand in America. The Anchor Cable Co. had had a good year, the result of which had assisted the profits of the company. The outlook for the rubber wires which the Anchor Co. manufactured continued satisfactory.

Sir T. O. Callender, J.P., in seconding, supplemented the chairman's remarks on the strike, and expressed his appreciation of those men who had stood by the firm in the most loyal manner. They were looking forward to returning to the regular quantity of business at an early date. In the one or two instances where it had not yet been found possible to resume, they would do so as soon as complete transport facilities existed—which were, at present, wanting—and as soon as power was available to the fullest extent. The prospects for the year were, otherwise, excellent, and the company was looking forward to a large volume of business, especially in the higher grades of cables. As regards the company's operations abroad, these had been extended in a number of directions. India still remained their best customer, and in Bombay they had a well-run office with an adequately equipped staff. They had now started a new department in India, for the company had secured a contract for the overhead equipment for the electrification of some 24 miles of railway for the Bombay, Baroda and Central India line. That work was the beginning of some very large contracts in other parts of the country. The company had just finished the electrification of the Peninsula of Aden, and they had a large amount of work to do in the Malay Peninsula in connection with the Borneo Company, whilst in Khartoum and the Sudan they were working at full pressure on the important contract to which reference was made last year. Around the East Coast of Africa and various other parts of the world they were doing a large amount of work. In China they had had a very useful experience of what their men could do. During the period when Shanghai was suffering severely from strike fever and revolutionary ideas, the company laid through the main streets of that city a complete set of underground cables for the Tramway Company without any casualty whatever. Even Zanzibar was

buying a considerable quantity of material from them, and from Sydney, New South Wales, they had just secured one of the largest contracts for "super-tension" cable ever placed in this country or elsewhere. The Okonite-Callender Co. was now enjoying the benefit of the parent company's long experience, and had had the assistance of some of their best men, with the result that it had now one of the finest businesses on the Western side of the Atlantic.

The report and accounts were adopted, and at a subsequent extraordinary meeting the increase in the company's capital was approved.

Brush Electrical Engineering Co., Ltd.

The report for the year ended December 31st last states that the balance remaining at the credit of the profit and loss account in the preceding year (£76,190) has been carried to an undivided profits account, and does not, therefore, appear in the report. After providing for general charges, maintenance, debenture interest, &c., the net profit for the past year is £62,197. From this amount it is proposed to transfer £5,544 to general reserve; to pay a dividend of 10 per cent.; and to pay a further 4 per cent. interest on the prior lien second debenture stock; leaving £8,751 to be placed to the credit of a proposed co-partnership scheme suspense account. It is stated that consultations have taken place with the staff and workpeople, the trade unions concerned, and the Engineering Employers' Federation. A definite co-partnership scheme has not yet been formulated, but discussions are still proceeding, and there is a prospect of a satisfactory result. A tentative scheme has been drawn up and submitted to the shareholders for their provisional approval. The general reserve now amounts to £233,633. The sum of £3,180 was spent on capital account during the year. It is stated that during the year there was an improved demand for Brush-Ljungström turbo-generators and other engineering plant manufactured by the company, and important installations were carried out at home and abroad. The rolling stock department has been kept busy in the manufacture of electric tramcars and motor omnibuses, and the current year's prospects for further contracts are satisfactory. Meeting: June 14th.

Shanghai Electric Construction Co., Ltd.

The annual meeting was held on June 2nd Mr. L. W. Hawkins, presiding in the absence of the chairman (Mr. J. S. Haskell), said that the year under review had been one of anxiety and difficulty owing to the serious disturbances in Shanghai. Not only had the company's revenue been affected, but development was retarded postponing a return upon the new capital which had been raised in the preceding year. The fact that the board had been able to declare a dividend of 10 per cent. on the increased capital was testimony to the company's stability and vitality. The continuous growth of the business, coupled with the permanently increased cost of labour and materials, would render inevitable in the future larger appropriations for renewals than had been made in the past. The company had 37 trolley omnibuses in service which were producing satisfactory results; the board's experience pointed to the desirability of opening new routes gradually. It was expected that 60 new 'buses would be in service by the end of the current year, and the board believed that as the traffic developed it would be expedient to increase the number from time to time. In conclusion Mr. Hawkins referred to the bugbear of depreciation of the subsidiary coinage with which the company was always burdened. The report and accounts were adopted.

Ever-Ready Co. (Great Britain), Ltd.

Mr. C. H. C. Moller presided at the annual meeting on June 1st, and in presenting the report and accounts (*vide* Elec. Rev., May 14th and 21st, p. 774). said that the past year had been a record one, the increase extending to every department of the company's activities. Furthermore, in spite of the general strike, the figures for April and May showed a considerable increase over those of the corresponding period of 1925. The directors felt that they should be in a position to issue further capital in case of need and resolutions providing for that were to be submitted. In the event of future issues the present shareholders, as on previous occasions, would be given the first opportunity to increase their holdings. The chairman mentioned that £30,000 had been invested in War Loan and that the number of shareholders now exceeded 1,500. After the ordinary meeting special meetings were held at which resolutions approving the creation of 250,000 ordinary shares of £1 were passed. This raises the nominal capital of the company to £750,000.

Dubilier Condenser Co. (1925), Ltd.

Speaking at the annual meeting on June 1st, the chairman (Sir Arthur Dickinson) said that the board as at present constituted had taken over the affairs of the company in June last year, and, unfortunately, had had to contend with an entirely unexpected depression in the radio industry. In the case of the company the effects of the depression were aggravated by the fact that it had recently moved into new premises at North Acton and this necessarily added to the overhead expenses. It was the company's policy to keep abreast, or ahead if possible, of all developments and improvements in the radio industry and other lines emerging from it; such developments on sound and conservative lines were the life-blood of a concern like theirs. While the results of trading must be considered disappointing, they were perhaps better than might have been expected in the circumstances. Mr. W. H. Goodman (managing director) spoke of the company's activities and made particular mention of the installation of mica condensers at the Rugby radio station, which, he said, were the largest ever made. The report and accounts were adopted.

United River Plate Telephone Co., Ltd.

The directors' report for the past year states that the revenue was £2,023,002 and the expenses were £1,618,858, leaving a balance of £404,144. After deducting debenture interest and preference and interim ordinary dividends there remains £266,644, which it is proposed to distribute as follows:—Final dividend of 5 per cent. on the old ordinary shares (making 8 per cent., free of tax); a dividend of 5s. per share on the last issue of ordinary shares, free of tax; leaving £38,644 to be added to the amount brought forward and carried to the current year's accounts. The progress of the company is satisfactory, although delays in the delivery of plant have retarded the rate of connecting up subscribers. Sufficient equipment is in course of manufacture to enable the company to meet the demands of the public. Further capital will be needed and it is proposed to create 200,000 shares of £5 each, raising the nominal capital to £6,000,000; it is not intended to make an immediate issue. The meeting was held on Tuesday last.

Electric Construction Co., Ltd.

This company's report for the year ended March 31st last records a net profit of £37,250, to which is added £21,411 brought forward, making £58,931. Interim dividends absorbed £11,197, and it is proposed to allocate the balance (£47,734) as follows:—Final dividend on the 7 per cent. preference shares, £2,197; final dividend at the rate of 9 per cent. on the ordinary shares, making 7½ per cent. for the year, and a bonus of 2½ per cent., £21,000; £3,000 to staff superannuation fund; leaving £21,537 to be carried forward. The report says that the general depression in trade reacted on the electrical manufacturing industry, and severe competition continued to prevail. Export business showed some contraction, but in the circumstances the directors consider the results satisfactory. The death of Sir Henry Mance is recorded, as is the appointment of Mr. W. M. Furniss, manager of the Wolverhampton works, to the board. The meeting was to be held yesterday (Thursday).

French Companies.

The *Compagnie Continentale Edison* proposes to pay a dividend of 37.50 fr. per share out of net profits of 1,626,000 fr. for 1925, as compared with 35 fr. in the previous year.

The accounts of the *Compagnie Française Thomson-Houston* show, after provision for depreciation, net profits amounting to 11,754,000 fr. for 1925, as compared with 14,940,000 fr. in the previous year.

The *Société Petrier, Tissot and Raybaud*, Lyons, maker of electrical apparatus, records net profits of 526,000 fr. for 1925, as compared with 675,000 fr. in the preceding year; it is proposed to maintain the dividend at 15 fr. per share.

The *Société des Appareils Electriques et Compteurs Garnier*, Lyons, reports net profits of 402,000 fr. for 1925, as against 390,000 fr. in 1924, permitting of the payment of a dividend at the rate of 75 fr. per share, as against 65 fr. in 1924.

The *Compagnie Générale de Télégraphie sans Fil* records net profits of 7,308,000 fr. for 1925, as compared with 7,250,000 fr. in 1924; the dividend is again at the rate of 45 fr. per share.

The *Société d'Electro-Chimie, d'Electro-Métallurgie et des Aciéries Electriques d'Ugine* reports a net profit of about 9,000,000 fr. as compared with 8,000,000 fr. in 1924. The dividend is at the gross rate of 45 fr. per share as against 40 fr.

The *Société des Magnetos* states that the turnover in 1925 appreciably increased and this development has induced the directors to proceed with an extension of the works constructed two years ago. The net profits at 2,912,000 fr. are greater than in the previous year and the dividend is 26 fr. per share.

German Companies.

The directors of the *Felten and Guilleaume Company*, Cologne-Mulheim, recommend a dividend of 6 per cent. for 1925, as in the previous year.

The *Saxony Works, Light and Power Company*, Dresden-Niedersedlitz, reports a turnover of 24,000,000 marks in 1925, being a large increase over the previous year. After writing off 685,000 marks for depreciation, it is proposed to pay a dividend of 6 per cent. and carry 54,000 marks forward.

The *Land and Sea Cable Works Company*, Cologne-Nippes, states that the works were busy in the first half of 1925, but in the second half the orders received considerably declined, and this condition has continued this year. The net profit was 337,000 marks, as compared with 315,000 marks in 1924, the dividend remaining at 10 per cent.

Swiss Company.—The *Alioth Electricity Company*, Basle, which has become a holding company and is in close relations with Brown, Boveri and Co., Baden, records net profits of 346,000 fr. for 1925, and a dividend at the rate of 5 per cent. on the share capital of 6,000,000 fr.

Clayton & Shuttleworth, Ltd.—The accounts for 1925 show a further loss of £13,071; the preceding year's deficit was £106,203, making a total of £119,274 for the two years, which is slightly reduced by the credit balance from 1923 (£2,196). The company's liability to the Government has

been reduced from £73,295 to £47,500, and £30,000 is to be paid in the current year, necessitating fresh arrangements with the company's bankers. The directors propose a re-organisation of capital. The works and plant have been valued at £208,586, or within £19,000 of the book value, which is considered satisfactory. The sum at the credit of the suspense account includes the concession made by the Government, and the total of that account, £75,749, will be available for depreciation and to set against the debit balance. Meeting: June 15th.

British Electric Traction Co., Ltd.—The directors report that the gross profit for the year ended March 31st last amounted to £300,544, as against £286,587 in 1924-25. After deducting general expenses and loan and debenture interest there remains £171,538, which the directors recommend should be dealt with as follows:—Dividend of 6 per cent. (3 per cent. already paid) on the cumulative participating preference stock; dividend of 8 per cent. (3 per cent. paid) on the ordinary stock; and £22,493 to undivided profits account, making that account £294,490. The amount standing to the credit of the reserve account is £520,000. The average revenue from investments rose from 5.52 to 5.91 per cent. Sir E. C. K. Ollivant has resigned from the board and Viscount St. Davids has been appointed a director. Meeting to-day (Friday).

Madras Electric Supply Corporation, Ltd.—The net profit for 1925 was £45,386, an increase of £12,407, and to this is added £6,185 brought forward, making £51,571. It is proposed to pay a final dividend of 5½ per cent., free of tax, again making 8 per cent., tax free, for the year; to transfer £10,000 to general reserve; and to carry forward £5,550. The rate of increase of sales was retarded by the closing down of two bulk supply consumers, but otherwise progress was satisfactory. The tramways showed a balance of £21,515 (against £24,124 in 1924), after providing for debenture interest, &c. A dividend of 6 per cent., free of tax, has been declared on the ordinary shares and a balance of £7,515 is carried forward. Meeting: June 16th.

Eastern Extension, Australasia and China Telegraph Co., Ltd.—The gross revenue for the year ended December 31st last amounted to £1,953,927, and the balance, after deducting £691,003 for ordinary expenses and £256,514 for maintenance, &c., to £1,006,410. After meeting taxation and debenture interest and adding £409,141 brought forward, there remains £1,263,435, from which £450,000 has been transferred to the general reserve. The dividends, totalling 10 per cent., free of tax, for the year, absorb £400,000, leaving £413,435 to be carried forward. The duplication of the Cocos-Fremantle section was successfully completed in March last. The meeting was held yesterday (Thursday).

Cawnpore Electric Supply Corporation, Ltd.—The directors report a surplus of £58,874 for 1925. The deduction of debenture interest left £45,743, to which was added £1,248 brought forward, making £46,991. After transferring £10,000 to depreciation and renewals reserve and £3,000 to general reserve, writing off £2,560 from share issue expenses, &c., and paying the preference and interim ordinary dividends, there remained £15,460. A final dividend of 7 per cent. on the ordinary shares (making 10 per cent.) and directors' commission, absorb £11,760, and £3,700 is carried forward. The meeting was held on Tuesday last.

Prospectus.—*Lancashire United Transport & Power Co., Ltd.*—This company, formerly known as the Lancashire United Tramways, Ltd., has this week invited subscriptions to an issue of £250,000 six per cent. first mortgage debenture stock at 93 per cent., principally to provide the money required to redeem the outstanding balance of £202,671 prior lien debenture stock. The list is to close to-day (Friday) or earlier.

Submarine Cables Trust.—Sir John Denison-Pender, G.B.E., presided at the annual meeting last week, and in presenting the report stated that the profit for the past year had been sufficient to cover the 6 per cent. interest, free of tax, to the certificate holders, and to enable them to redeem 210 certificates, leaving 330 outstanding. After the next drawing of certificates, probably in May, 1927, the trustees hoped to be able to take the necessary steps to terminate the trust which was started in 1871. During its existence the value of its holdings had doubled.

Stock Exchange Notices.—Application has been made to the Committee to allow the following to be officially quoted:—

Newcastle-upon-Tyne Electric Supply Co.—550,000 ordinary shares of £1 each, fully paid, Nos. 1,762,682 to 2,312,681.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Electrical Finance and Securities Co., Ltd.—76,162 shares of £1 each, fully paid, Nos. 1 to 76,162.

Madras Electric Supply Corporation, Ltd.—23,600 5½ per cent. (free of income tax) cumulative preference shares of £1 each, fully paid, Nos. 303,201 to 326,800.

Colombo Electric Tramways and Lighting Co., Ltd.—The accounts for the year ended December 31st last show a net profit of £108,416. After providing for debenture interest, &c., and adding the balance brought forward, the amount available is £128,591. From this £39,933 is transferred to general reserve and renewal fund, which after certain writing-off amounts to £250,000. A dividend of 15 per cent., free of tax, is recommended; this will leave £69,029 to be carried forward.

Iron Trades Employers' Insurance Association, Ltd.—The premium income for 1925 was £543,447, and sundry additions, including the balance brought forward, give total receipts of £672,552. Of this £468,855 has been set aside for compensation and incidental expenses and £64,808 for management expenses, &c. A return at the rate of 20 per cent. of the workmen's compensation premium for 1925 is recommended. Sir J. E. Thornycroft, K.B.E., has taken the place of Sir John Dewrance, K.B.E., on the board, and the appointment of Mr. F. J. West as a director is recommended.

China and Japan Telephone and Electric Co., Ltd.—The accounts for 1925 show a net profit of £18,639; to this is added £8,162 brought forward, making £26,801. It is proposed to transfer £10,000 to reserve, to pay a dividend of 20 per cent. and a bonus of 10 per cent., both free of tax, and to carry forward £4,873. The sale of the company's undertaking in the Hong Kong area to the Hong Kong Telephone Co. was completed in July, 1925. The Hong Kong Co. has declared a dividend for the six months at the rate of 8 per cent. per annum. The meeting was to be held yesterday (Thursday).

Ruston & Hornsby, Ltd.—The accounts for the year ended March 31st last show a credit balance of £152,551, and an available sum of £80,170, after deducting depreciation and debenture interest. The addition of £69,887 brought forward gives £150,057. From this are deducted preference dividends paid to December 31st, 1924, and it is proposed to pay one year's dividend on the two classes of preference shares, and a dividend of 2½ per cent. on the ordinary shares, leaving £28,307 to be carried forward.

J. G. White & Co., Ltd.—This company, which operates through subsidiary concerns, records a net profit of £8,156 for the year to February last. Out of this £7,367 is written off in respect of investments, leaving £789, which is placed against a debit balance of £244,789 brought forward, reducing it to £244,000. The debit balance is due to the writing-off of advances to two subsidiary companies. The directors are considering a scheme for the reorganisation of the company's capital and hope to put proposals forward at the annual meeting on June 14th.

West African Telegraph Co., Ltd.—The net revenue for the past year was £14,318, and after providing for income tax and adding £2,030 brought forward there remains £13,374. The directors propose to transfer £3,000 to general reserve, to pay a dividend of 4 per cent., free of tax (as in 1924), and to carry forward £1,131.

Havana Electric Railway, Light and Power Co.—The gross earnings for 1925 amounted to $15,309,372 and the net earnings to $7,242,060. Dividends of 6 per cent. have been paid on the preferred and common stock and $5,059,845 is carried forward.

Stanton Ironworks Co., Ltd.—The directors recommend a final dividend of 6 per cent., free of tax, on the ordinary shares, making 10 per cent., free of tax, for the fifth year in succession.

New Issue.—*Ericsson Telephones, Ltd.*—The recent issue of 99,980 seven per cent. cumulative preference shares at £1 each was considerably over-subscribed. Letters of allotment and regret in respect of the issue were posted on Monday.

Anderston Foundry Co., Ltd.—Out of a profit of £13,076 the directors propose to pay a dividend of 7s. 6d. per share, as compared with 9s. in 1924-25.

Pennsylvania Water and Power Co.—A dividend of $2 per common share has been declared in respect of the quarter ending June 30th.

British Thomson-Houston Co., Ltd.—The directors propose to pay (on July 1st) a dividend in respect of the half-year to June 15th on the 7 per cent. cumulative preference shares.

Canadian General Electric Co., Ltd.—A dividend of 1¾ per cent. has been declared on the preference stock in respect of the quarter ending June 30th.

Guest, Keen & Nettlefolds, Ltd.—A final dividend of 1s. per ordinary share has been declared, making 10 per cent., free of tax, for the year 1925-26, as in the preceding year.

Quebec Power Co.—Dividends of $1¼ per common share and $1¾ per preferred share have been declared in respect of the quarter ending June 30th.

Stocks and Shares.

MONDAY EVENING.

STOCK Exchange markets are developing upon firm and satisfactory lines. Satisfactory, that is to say, to the present holders of stocks and shares, who view with pleasure the way in which prices steadily advance week by week. There can be no doubt that the reason for the increase of business and of confidence that has come to the markets is due to the collapse of the General Strike, and to the greater feeling of security now felt by the capitalist, large and small. It seems practically certain that for some time past there has been at the back of people's minds an uncomfortable fear of what a General Strike might mean if it should be called. The worst has happened, and the General Strike has shown itself to be

a failure from the principal point of view of holding up the nation and strangling industry.

Relieved of the apprehension, money is going into all sorts of securities, more particularly those of the best-class order. The lists of stocks and shares which are printed here, testify to the favour in which sound Industrials are held by the public. Cable stocks are uniformly harder. There has been a good deal of inquiry for electricity supply shares, though the changes in prices hardly reflect this. In the group of manufacturing and construction shares, the feature is the maintenance of the remarkable advances that have occurred during the past four weeks. New issues are commanding a very general degree of success. It is only necessary for good stock to be offered at a reasonable price for it to be eagerly taken, and for the subscription lists to close very promptly.

The Submarine Cables Trust is coming to an end in the near future and Sir John Denison-Pender, at the company's meeting the other day, mentioned that the market value of the various holdings shows an appreciation of nearly 100 per cent. over the original cost price. Holders have done very well during the fifty-five years of the Trust's existence, and they are likely to receive a handsome bonus at the final redemption of the certificates.

Home Railway stocks are inclined to be dull, as is natural, though the falls are slight and insignificant. The Southern Railway's ambitious suburban electrification scheme, which, it will be remembered, ran into eight million pounds, has now reached its final stage. Underground Electric ordinary shares are 5s. down and the shilling issue, at 10s. 6d., have lost 1s. Districts weakened to 52½. Central London Assented stocks are scarce.

South London Electric Supply are a harder market at 2½. London Electric preference show a modest gain. County of London have parted with some of their recent strength: Bournemouth and Poole are also easier. There is a fair line of Electric Supply Corporation 6 per cent. preference shares on offer at 21s. 3d., with January and July dividends. The yield comes to £5 13s. per cent. on the money. Several thousand English Electric 6 per cent. preference can be obtained at 19s. 3d., to pay 6¼ per cent. on the investment. Dividends in this case are in April and October. British Automobile Traction 8 per cent. preference are available at 25s. 6d. These rank for a further 2 per cent. after the ordinary have received 8 per cent. The preference are in regular receipt of this extra 2 per cent., and, allowing for this, a buyer gets 7⅞ per cent., dividends in February and August.

Rises amongst cable stocks have lifted the prices of Anglo-American preferred and deferred, and all the ordinary stocks and shares in the Eastern list. Following upon the excellent Eastern Telegraph report, the "China" Company issues a statement in which, although the net profit is a trifle less than that of a year ago, the shareholder cannot fail to find satisfaction. The West African Telegraph Company repeats its 4 per cent. tax-free dividend. Marconis have strengthened to 25s., and Marconi Marines are 2s. 6d. up, at 21s. 3d., in sympathy partly with the advancing parent shares—partly on account of the better feeling that characterises the market for shipping shares.

British Electric Tractions are again higher, at 133½, at which the yield on the money is modest at 6 per cent. Foreign traction varieties are steady. The healthier tendency of Mexicans continues to be noticeable. Brazilian Tractions just manage to keep in three figures. Anglo-Argentine Tramways first preference are changing hands in fair quantities around 62s. 6d., the speculative investor being attracted by the yield of 8¾ per cent. on the money. Colombo Electric Tramways declares a dividend of 15 per cent. tax-free on the ordinary shares.

If the manufacturing shares do not exhibit any special advances, the market in them is, nevertheless, so hard as to provoke a jobber to complain that prices are too good. This is a market lament at quotations having reached a level which renders new buyers cautious, though the companies are doing well enough to preclude any desire to sell on the part of holders. British Insulated, Callenders and India Rubber shares are better. General Electrics and Siemens have drooped. At the recent meeting of the Siemens Company, the chairman spoke with hopefulness of the outlook, provided that operations continue as at present, without interruption. On the same day, the British Thomson-Houston chairman referred to a lowering in the margin in his company's profit, owing to the keenness of competition. British Thomson-Houston 7 per cent. preference stand at 23s. 6d. and the 7 per cent. mortgage debenture stock (redeemable) at 105½.

Babcock & Wilcox attract a good deal of business around 52s. Other shares in the iron and steel market are dull, owing to the coal position and the effect of the Armstrong report. The rubber share department is stagnant, business having fallen into humdrum and uninteresting lines by reason of the quietude of the market in the raw material.

Windmill Electricity Generators.

(*Summary of a Report by the* INSTITUTE OF AGRICULTURAL ENGINEERING, UNIVERSITY OF OXFORD.)

HITHERTO no attempt has been made in this country to investigate systematically the various details of design for the generation of electricity by wind-power, or to offer means whereby manufacturers might obtain authoritative figures bearing on the general problem, or on their designs. Accordingly, the investigations originally undertaken by the research branch of the Ministry of Agriculture and carried out at the Harpenden windmill experimental station of the Institute of Agricultural Engineering* should serve as a contribution to the solution of the problem.

Apart from the purely technical side of the subject, there is the equally important economic side; users of other forms of motive power have reliable figures at their command on which to base their forecasts as to the cost of their generated electricity, but users of windmills are quite in the dark in this respect. In spite of the makers' endeavours to give reliable figures, a windmill is generally installed on a hit-or-miss principle, and there is no doubt that the consequent pausity of reliable data is the main cause of many prospective users deciding to reject this form of power.

Similar vagueness exists with regard to the amount of available winds throughout the year, the critical periods of calm, &c. It is hoped by the collection of data on wind conditions to put all these factors on a more certain footing, so that it will be possible to plan a windmill generating installation with the same security as that which already applies to any other system.

Wind-speed fluctuates with marked rapidity, the range being two or three m.p.h. in low winds and as much as 20 or 30 m.p.h. in high winds. Another fact which the tests established is that the wind-speed is never coincidently the same at two different points, and also becomes greater as the height above ground is increased. If the blade were of the correct stream-line shape, not only would there be no detraction from the pressure on the front of the blade, but there would be a suction effect on the back which would help the front pressure. It is thus seen how important it is to have stream-lined blades, in order to obtain greater outputs from a given-sized wheel. A further consideration must, however, be made; the formation of any eddies, even for quite a distance behind the blade, is fatal to stream-line flow, and any structure behind the wheel is bound to lead to the formation of eddies. Less harm is done by a structure in front of the wheel, and in all mills where completely stream-lined blades are used, the wheel is placed behind the structure, which has the additional advantage of not requiring any direction control, since the wind-pressure on the wheel is behind the pivoting centre, and the wheel is kept in a position facing the wind-stream. It might be thought that, tending as they do to higher efficiency, stream-lined blades would be employed exclusively, but as there is no fuel cost and attention is entirely directed to cutting down first costs and maintenance charges, most manufacturers will remain conservative until stream-lined blades can be more easily and conveniently produced.

One essential component of a windmill generating plant is the storage battery, and while attempts have been made to dispense with this costly item, there is little doubt that any system of windmill generation must include a battery to obtain satisfactory working. An efficient cut-in should operate with a minimum rise of the generator voltage over that of the battery voltage, say, two volts, and should cut out when, and not before, the charging current has reached zero, thus preventing flashing. Usually small sets of, say, ½ kW, have a generator designed to give a constant efficiency of about 60 per cent. over the whole load range; for larger sets a generator is usually employed with an efficiency up to 80 or 90 per cent. at full load; at light loads the efficiency of such a generator will be low, about 30 or 40 per cent. For the voltage range to be as small as possible the field system in smaller sets is usually designed to work on the top part of the magnetisation curve, giving early saturation of the field; in larger sets compounding is introduced, while in still larger sets up to 10 kW, where the greater size justifies more supervision, field-regulating resistances may be fitted. One particular set includes a pressure regulator which keeps the voltage absolutely constant, but the losses in this device are so great that the method is being abandoned.

Seven sets of plant have been tried, representing five makes, as follows:—

No. 1 *Airolite* (Telford, Grier and Mackay, Ltd.). Wheel diameter 14 ft., 18 single concave blades; 1.5-kW, 120-volt, bevel-geared generator.

No. 1a. Same as above, with new wheel, 12 ft. 6 in. diameter, with 12 outer and 18 inner blades.

No. 2 *Garty-Apex* (Glasgow Electrical Engineering Co., Ltd.) Wheel diameter 8 ft., 15 single concave blades; 400-watt, 50-volt, spur-geared generator.

No 2a. Same as above, with new wheel.

No. 3. Similar to No. 2.

No. 4 *Ventimotor* (Patent Lighting Co., Ltd.) Wheel diameter 8 ft. 6 in., 4 semi-stream-lined blades; 250-watt, 50-volt, double-reduction, chain-driven generator.

No. 5 *Aerodynamo* (Aerodynamos, Ltd.) Wheel diameter 29 ft. 5 in., 4 stream-lined blades; 10-kW, 220-volt, double-reduction (2 sets internal), spur-geared generator.

No. 6 *Agricco* (Young, Osmond & Young, Ltd.) Wheel diameter 22 ft., 5 semi-stream-lined hollow blades; 5-kW, 150-volt, double-bevel, spur-geared generator.

No. 7. Similar to No. 4.

The results of the investigations are divided into (*a*) economic, showing the cost per kWh supplied by each plant over a period of one year; (*b*) technical, with curves showing the power developed at each wind-speed, and subsidiary curves derived from these; and (*c*) meterorological, with tables showing the wind conditions throughout the year. The financial charges incurred during the year include interest and depreciation based on the capital cost of the plant and battery, and maintenance; the total output of the generator cannot, for the purposes of these calculations, be accepted as the net available output, since there is necessarily a loss in storage due to the inefficiency of the battery. The figures given as to the cost per kWh produced only hold good provided that the utmost use is made of all the available power. In most cases, however, the plant is larger than is necessary for its load, and as there will be long periods of high winds during which the battery is being overcharged, with consequent waste, a higher charge will be thrown on the units which are actually consumed.

The only true basis of wheel efficiency is that of output/cost and not output/input as is usual. The disk area basis of calculation gives the multi-bladed wheels the highest position, whereas on the blade-area basis the highest points are taken by four- and five-bladed wheels. One four-bladed wheel (No. 5, "Aerodynamo") stands out clearly above the others, even at low wind-speeds, and this margin is so great that it enables the cost per sq. ft. of constructing these blades to be much higher than that of the next best, and yet to maintain the highest efficiency on the output/cost basis. The next highest type on the blade-area basis is No. 6 "Agricco," but it is closely followed (and surpassed at low wind-speeds) by No. 2a "Garty-Apex" with improved wheel (outer trailing-edge of each blade rounded off). No. 7, identical in design to No. 4, is superior to No. 6 and No. 2a at higher wind-speeds, but it is inferior to them at low speeds. No. 1a is fitted with a new "high-efficiency" wheel. No. 1 (the old wheel) and No. 2 (the old "Garty-Apex" wheel, identical with No. 3) are approximately the same. The larger sets (Nos. 1, 5 and 6) have an additional advantage at higher wind-speeds inasmuch as they have a higher generator efficiency than is practicable with the smaller sets, but in the case of Nos. 5 and 6 the results given are not necessarily accepted as final.

The following figures represent the cost per kWh of electricity produced by each mill:—

No. 1.	Capital outlay	£343 0 0
	Annual charges	£48 8 11
	Total output per year	1,370 kWh
	Available output per year	1,028 kWh
	Cost per kWh	11.3d.
No. 1A.	Total output per year	1,780 kWh
	Available output per year	1,336 kWh
	Cost per kWh	8.7d.
No. 2.	Capital outlay	£130 0 0
	Annual charges	£18 2 8
	Total output per year	608 kWh
	Available output per year	456 kWh
	Cost per kWh	9.5d.
No. 2A.	Total output per year	912 kWh
	Available output per year	684 kWh
	Cost per kWh	6.4d.
No. 3.	Capital outlay	£118 0 0
	Annual charges	£16 13 6
	Total output per year	421 kWh
	Available output per year	316 kWh
	Cost per kWh	12.7d.
No. 4.	Capital outlay	£120 0 0
	Annual charges	£15 15 8
	Total output per year	435 kWh
	Available output per year	326 kWh
	Cost per kWh	11.6d.
No. 5.	Capital outlay	£900 0 0
	Annual charges	£130 13 4
	Total output per year	10,195 kWh
	Available output per year	7,646 kWh
	Cost per kWh	4.1d.
No. 6.	Capital outlay	£415 0 0
	Annual charges	£59 4 8
	Total output per year	4,768 kWh
	Available output per year	3,576 kWh
	Cost per kWh	4.0d.
No. 7.	Total output per year	491 kWh
	Available output per year	368 kWh
	Cost per kWh	10.3d.

To the question: Does the cost per kWh of electricity produced by wind power compare favourably with the electricity available from other sources? it may be directly replied that

*Oxford: Clarendon Press, Bulletin No. 1, price 2s. 6d. net.

the wind-mill method of power production does stand in a favourable position. Although at a first glance it would seem that the cost per kWh in the case of the smaller sets is high, it is obviously wrong to compare the results from 250- and 400-watt sets with those from larger plant of other types, and it is questionable whether any other form of electricity-generating plant, of the same rating, will bear comparison with small windmill sets on the score of the cost per kWh of energy produced. The medium-size plant gives figures that will compare favourably with the lighting rates of all but extremely happily situated supply companies, while the cost of the power produced by the larger sets is lower than most lighting rates, and almost as low as the power rates of several public companies. The cost, therefore, of windmill-generated electricity, either for small lighting or for small power purposes, is quite reasonable and such as to justify a wider use. When it is said that the costs compare well with those of supply companies, it is not implied that this form of power should be preferred to public supply: it would be absurd to neglect connection to a main supply line if at all possible.

Reliability and continuity of supply are in very many cases more important than cost, and any satisfactory settlement of doubts on this head will do more to encourage a wider use of windmills than any phenomenally low cost per kWh. Continuity of supply throughout the year will be assured, provided that care is exercised when selecting a plant to plan the load to suit the set at all seasons of the year. It may then be safely taken that there will never be a hitch in the working, except under extremely exceptional conditions, the chances of which are little greater than in any other form of power production. Care should also be taken to select a site in which there is nothing to interfere with the prevailing winds; at the Harpenden station the S. and W. winds, during the period of observation, constituted 75 per cent. of the total hours of wind per year. As regards amount of wind, the Harpenden site is perhaps above the average for lowland country, but in higher and more coastal districts better performances might be expected than those recorded in the report.

Those who, already owning an engine generating set, desire to supersede or supplement it, should have little hesitation in adopting wind-power. All over the country there are engine sets which have had a useful life and are now hardly fit for regular running, but could be used occasionally to charge the battery. The windmill set would provide the bulk of the supply, while the engine could make good any occasional deficiency, thus enabling a smaller plant to be chosen than would otherwise be necessary.

The Electrical Imports of Spain.

The following figures, showing the imports of electrical goods into Spain in 1925, are taken from the recently issued trade statistics. The totals for 1924 are given for purposes of comparison, but it is not possible to show the shares of the supplying countries in that year:—

	Quantities. 100 kilogs.
Dynamos, motors, transformers, switchgear, &c.—	
Total imports (1924)	54,973
(1925)	52,902
of which from:—	
Germany	14,817
United States	10,163
France	7,300
Great Britain	5,311
Sweden	2,392
Belgium	2,388
Switzerland	1,851
Self-contained generating sets—	
Total imports (1924)	3,626
(1925)	3,397
of which from:—	
Germany	1,334
France	1,264
Great Britain	348
United States	154
Switchboards—	
Total imports (1924)	1,402
(1925)	1,332
of which from:—	
Germany	383
United States	274
France	240
Great Britain	173
Electrical fittings (switches, lampholders, &c.)—	
Total imports (1924)	4,513
(1925)	7,810
of which from:—	
United States	2,981
Germany	1,816
Great Britain	1,219
Electrical measuring instruments and parts thereof—	
Total imports (1924)	1,817
(1925)	1,991
of which from:—	
Germany	1,243
France	251
Switzerland	379
Great Britain	44
Stoves, heaters, cookers, irons, &c.—	
Total imports (1924)	460
(1925)	568
of which from:—	
Germany	157
Switzerland	230
Accumulators, dry batteries, and parts—	
Total imports (1924)	4,961
(1925)	7,618
of which from:—	
Denmark	1,672
Germany	1,121
Great Britain	1,036
United States	966
France	917
Norway	501
Wires and cables—	
Total imports (1924)	6,563
(1925)	13,037
of which from:—	
Great Britain	4,926
Germany	4,293
France	1,542
United States	880
Telegraph and telephone switchboards and apparatus—	
Total imports (1924)	1,633
(1925)	3,647
of which from:—	
France	979
Belgium	655
Germany	598
Great Britain	534
United States	397
Sweden	355
Incandescent electric lamps—	
Total imports (1924)	601
(1925)	666
of which from:—	
Holland	411
Great Britain	77
France	5
Electric mercury vapour lamps, searchlights, &c.—	
Total imports (1924)	85
(1925)	82
of which from:—	
United States	33
France	12
Arc lamps and parts, &c.—	
Total imports (1924)	21
(1925)	15
of which from:—	
Germany	10
France	3
Holland	1
Carbons, other electrodes, &c.—	
Total imports (1924)	4,103
(1925)	3,486
of which from:—	
United States	1,181
Great Britain	1,002
Germany	773
France	44
Insulating tapes, fabrics, and tubes—	
Total imports (1924)	206
(1925)	8,159
of which from:—	
United States	4,906
Germany	3,127
Great Britain	22
Switzerland	13

A Topical Exhibit.—In collaboration with the Telephone Development Association, the Automatic Telephone Manufacturing Co., Ltd., principal manufacturer of the Strowger system now in process of installation for the British Post Office throughout Greater London and the provinces, has presented to the Science Museum, South Kensington, actual specimens of typical components of the system. The exhibit, which will be displayed in the Telegraph, Telephone, and Wireless Section of the Museum, comprises four items, separately mounted and arranged for convenient inspection by the public.

The Electricity (Supply) Bill.

The Proceedings in Committee.

(*Continued from page* 811.)

THE Standing Committee of the House of Commons resumed consideration of the Electricity (Supply) Bill, which was adjourned during the Whitsuntide recess, on Thursday, June 3rd. Sir Robert Sanders presided.

Discussion was begun on clause 2, which deals with the general powers and duties of the Central Electricity Board, set up under Clause 1.

Mr. G. BALFOUR (Hampstead, U.) moved an amendment to provide that the duties of the Board should be to consider and settle schemes prepared under Clause 4 of the Bill. He said that his amendment merely followed the modification which was agreed to by the Minister in charge of the Bill on the second day of the Committee proceedings. That modification changed completely the character of the Bill. It provided that the duties which were originally intended to be carried out by the Board should be carried out by the Electricity Commissioners. The object of the amendment was to try and carry out in a non-contentious manner that which had been agreed on by the Minister. The Board originally was to frame schemes, but now it was to be constituted as a tribunal to consider schemes which were submitted to it by the Electricity Commissioners. He was simply endeavouring to put into this clause the appropriate words to give effect to the changes already agreed upon; to define the new duties of the Board as agreed by the Committee. If his amendment was carried, he intended to move a further amendment providing that the Board, instead of supplying electricity, should co-ordinate the supply of electricity.

Sir DOUGLAS HOGG, the Attorney-General, said that the Government was not prepared to accept the amendment. There appeared to be some extraordinary misapprehension in the mind of Mr. Balfour. He had repeatedly referred to something which had been "agreed upon" on the second day of the proceedings under which the whole scheme had been completely altered, and to which he contended that effect would be given to by his amendments, under which the duty of supplying electricity was to be no longer one of the functions of the Board. Never had there been a suggestion in the minds of the Government to agree to anything of the kind, and it regarded the duty of supplying electricity as one of the cardinal features of the Bill. The amendment was wholly unnecessary. The clause purported to define the general powers and duties of that Board, and began by saying that the Board should be charged with the duty of supplying electricity, and that the further powers and duties of the Board should be such as were provided under the Bill. One of those further powers consisted of the duties laid down under Clause 4 with regard to the preparation of schemes. But the essential and permanent function of the Board was to carry out the duty of supplying electricity. Before that could be done, schemes had to be settled in order to carry out the plan of the Bill, and for that purpose powers were given in Clause 4, when they came to it, and were referred to in Clause 2.

Mr. ATTLEE (Limehouse, Lab.) opposed the amendment, which he described as a wrecking amendment, and one which would destroy the whole object of the Bill.

Sir J. MARRIOTT (York, U.) said that he had listened with astonishment and dismay to the speech of the Attorney-General. He did not for a moment suggest that there was anything in the nature of an agreement in Clause 1 in the sense in which the word "agreement" was often used in the House, but he did suggest that on Clause 1 such a fundamental change was made in the texture of the Bill, with the assent of the Government, that some members felt that they would be compelled to adhere to Mr. Balfour's present amendment and his consequential amendment. Was it suggested that the Bill was not a Socialistic measure? He was under no misapprehension as to the purposes of the Bill.

Sir JOSEPH NALL (Manchester, Hulme, U.) contended that the Attorney-General let the cat out of the bag when he said that the chief function of the Bill was to set up a State Electricity Department.

Sir FRED. HALL (Dulwich, U.) declared that they were being asked to support a Socialistic measure introduced by a Unionist Government, and Unionist members were being asked to assist in making the Bill appear as innocent as possible. He and many members of the Unionist party were bitterly opposed to the Bill.

Mr. BALFOUR asked the Attorney-General whether he did or did not agree that the functions of the Commissioners and of the Board had been turned round. The Minister of Transport definitely said so at a previous sitting. If that was so, did not the Attorney-General agree that one of the principal functions of the Board would be to consider and settle schemes prepared under Clause 4?

Sir DOUGLAS HOGG: "So far as Clause 4 is concerned, I agree that before the adjournment for Whitsuntide I agreed that, instead of the Board preparing the scheme and putting it up to the Commissioners, the Commissioners should prepare the scheme and put it up to the Board, but it is no more the essential or main duty of the Board to settle schemes than it was previously its main duty to prepare them. The main and permanent features of the Board are to carry out and administer schemes when settled, and that will involve supplying electricity. So far as Clause 4 is concerned, the amendment is unnecessary unless you are going to carry the consequential amendment to provide that the Board should only co-ordinate the supply of electricity, and that the Government regards as vital and as involving the destruction of the Bill."

The amendment was negatived by 37 votes to 13.

Mr. CLAYTON (Widnes, U.) then moved Mr. Balfour's second amendment, to provide that the Board should co-ordinate the supply of electricity, and not supply electricity. The object of the amendment, he said, was to obviate making it obligatory on the Board to supply electricity. There was nothing in the amendment to prevent the Board supplying electricity if no other suitable sources of supply were available.

Sir DOUGLAS HOGG opposed the amendment, which, he said, would take from the Board the duty of supplying authorised undertakers with electricity. Such a proposal went right to the root of the Bill.

Sir JOSEPH NALL, who supported the amendment, said that the main function of the Board would be to interfere with every existing undertaker in the country. In no other country was such a system in force, nor had it been tried, except in Ontario. What was the case for encumbering the electricity supply of this country with the machinations of this new Department? The figures in the Weir Report, on which the Bill was based, were deliberately misleading. The whole case for this attempt at State Socialism in the supply of electricity was founded on a table of consumption of units per head of the population contained in the Weir Report—one of the most obviously misleading documents ever produced. That table had been manipulated so as to prejudice the position of Great Britain. If it was to be the business of the Board to supply electricity, then it would have to charge the distributing undertakers something more on the current distributed than the actual cost at which they generated. If that scheme was carried out, obviously the big industrial areas were going to have to carry, in addition to their own costs, a figure to cover the loss incurred in extending distribution in rural and undeveloped urban areas. He maintained that the existing electricity supply in this country was as efficient as that in any other country. If a State authority of this kind was to interfere with the great undertakings in this country, it was obvious that electrical development was going to be held up for a long time. The great municipalities, no less than the company undertakings, could not proceed with schemes of development during the passage of the Bill, and the time taken for the consideration of schemes framed under the Bill. Hence, at least a year or two must elapse before development would proceed.

Mr. WADDINGTON (Rossendale, U.) declared that the chief need of Lancashire was a cheap supply of electricity, and he doubted whether the Bill would achieve that end.

Mr. SANDEMAN (Middleton, U.) contended that the price of electrical energy would be increased by the expenses of this very costly Electricity Board.

Mr. E. HARMSWORTH (Thanet, U.), in opposing the amendment, said that anyone who had business in Canada and America knew that that business would be impossible to work were it not for a supply of cheap electricity. It was only when one compared America with this country that one realised how far behind British electrical undertakings were. Although the Bill was not perfect, it was a step in the right direction.

Mr. P. J. HANNON (Moseley, U.) said that there was a feeling in the industrial areas that they were not getting served with cheap electricity as well as they might be under some such comprehensive scheme as was contemplated in the Bill.

Mr. G. BALFOUR gave a number of facts and figures to show the growth of electrical development in this country, and asked: "Why gull the country with the cry of 'Electricity for all at a penny per unit'?" His understanding of the functions of the Board was that it should be a judicial body of arbitrators, to whom the Commissioners would submit complete schemes for analysis. He agreed that if there was any hold-up of development anywhere then, in the last resort, the Board must be clothed with full powers to overcome that obstacle. He did not agree that one of the functions of the Board should be to supply electricity.

Mr. LAMB (Stone, U.) said that agriculturists in this country had not a cheap supply of electricity comparable with the supply available in other countries. There was a genuine demand from the rural areas for cheap electricity for power and light. He opposed the amendment, which he did not think would lead to that demand being met. Under present conditions the rural areas had not had a fair chance.

The amendment was negatived by 37 votes to 13.

Mr. KELLY (Rochdale, Lab.) moved an amendment to delete from Clause 2 the words "but shall not, save as hereinafter expressly provided, themselves generate electricity." He explained that he did so in order to ensure that the Board would

be able to engage in the generation of electricity where desirable.

Col. ASHLEY, the Minister of Transport, said it had already been stated that this was not a Socialist Bill, but the amendment was an attempt to extend the scope of the Bill that would make it into a Socialist Bill by allowing the Board perfect freedom to generate electricity. The intention of the Bill and of the Government was that the generation of electricity, as heretofore, should remain, under the Bill, if at all possible, in the hands of private companies or the municipal authorities which were now generating. The Government hoped that in 99 cases out of 100 that would be so, and that private or municipal enterprise would not be interfered with any more than was absolutely necessary to secure co-ordination.

Sir JOSEPH NALL said that in a later clause it was laid down that the Board would not be able to undertake generation unless it satisfied the Electricity Commissioners that it was unable to enter into an arrangement with any authorised undertakers to operate it on reasonable terms. That was rather anomalous, for the Board was the superior authority and not the Commission. He opposed the amendment.

Mr. ATTLEE thought that the Board should be able to take over generating stations and pointed to the London scheme of co-ordination as a precedent.

Mr. G. BALFOUR said that the position of the London undertakings was entirely different from what Mr. Attlee imagined. There was no question of "taking over." The companies came forward voluntarily for powers to group, and many difficulties were encountered.

Sir FRED. HALL said he was entirely in favour of bulk production. It was only by bulk production and super-stations that they could hope to generate and distribute electricity on the most economical lines. But he was sure that no undertakers would refuse to carry distribution lines into areas where there was reasonable prospect of return. Private enterprise had developed the undertakings in the past as rapidly as possible.

The amendment was rejected by 30 votes to 11.

Sir PHILIP DAWSON (Lewisham, W., U.) moved to allow the Board to enter into arrangements with any authorised undertakers or other bodies without first obtaining the approval of the Electricity Commissioners.

Col. Ashley accepted the amendment, which was carried by 32 votes to 12.

The Committee then adjourned until June 7th.

(To be continued.)

Radio-Communication.

Mr. C. F. Elwell on its Past, Present and Future Aspects.

(Abstract of Paper read before the ROYAL SOCIETY OF ARTS.)

IN his recent paper before the above-named Society, Mr. C. F. Elwell reviewed some of the signal services which radio-communication had rendered in the past, and possible future uses. Dr. W. H. ECCLES, F.R.S., who presided, in introducing the author, referred to his past work and achievements, pointing out that, especially during the war years, the genuineness of his improvements in wireless engineering was amply substantiated. Mr. Elwell had supplied large arcs and high masts to various Allied Governments; for instance, at Rome he had erected for the Italian Government, during the war, a station containing two arcs of about 200 kW each and three masts more than 700 ft. high in the record time of about four months, which was a wonderful achievement when one considered the war-time conditions which prevailed and the limitations with regard to materials and labour.

Mr. C. F. ELWELL did not confine his remarks to the achievements of radio-communication alone, because it had helped other arts which, in their turn, had helped radio-communication with its problems. For example, the debt which telephone engineers owed to radio-engineering was now being repaid by the assistance which telephone engineers were giving in the solution of the problem of commercial two-way transatlantic radio-telephony

Dealing first with radio-telegraphy, he divided it into three classes:—(*a*) Communication over distances where wires or cables could not be laid; for example, with moving ships, trains, aeroplanes, motor-cars, &c.; (*b*) communications over distances which otherwise could only be spanned by means of expensive cables, for instance, with submarine cables; and (*c*) communication over distances which otherwise would be served by means of overhead wires or underground cables, *e.g.*, in competition with wire lines. Naturally, radio-telegraphy experienced no serious competition in the first class, and it was along these lines that it rendered its most valuable services. There were to-day about 16,500 ships equipped for the transmission and reception of radio-telegrams, and, to give them adequate service, some 1,600 land stations were being maintained.

The second class was a natural sphere for radio-communication, because of the great expense of laying long submarine cables and their liability to interruption. For a fraction of the cost of a submarine cable a practically uninterrupted service could now be given by two radio stations, which also had the great advantage of being able to communicate with many points. Greater efficiency of transmission was claimed for cables because messages could be sent to the ends of the earth with the aid of a few batteries, whereas the radio engineer in the past had been compelled to use many hundreds of kilowatts to accomplish the same end, but it could not be assumed that this condition of affairs would exist much longer, and it might not be long before the cable companies' strongly entrenched position would be assailed. For already established economic reasons radio could give a very good commercial service more cheaply than cables; the radio stations at San Francisco and Honolulu had caused a reduction of the ordinary message rate from 1s. 6d. to 1s. per word, and of the Press rate from 8d. to 1d. per word. The direct result of the reduction of the Press rate was an immediate increase in the quantity of world's news transmitted to Honolulu, the daily average of about 100 words having been increased to an average of about 1,500. Another example was the admission by the President of the Western Union Cable Co. in his annual report for 1924 that radio was responsible for 30 per cent. of the traffic across the Atlantic. The strategic value of radio to the Empire was in itself enormous. It could not be said that radio had made such an impression in competition with wire-line telegraphy, but it had exerted a healthy influence on the lowering of rates. In times of storm, too, radio had rendered signal services in maintaining communication.

The future possibilities of radio-telegraphy in class (*a*) had not yet been fully developed. The cost of telegrams from ship to shore and ship to ship was excessive, and this class of communication should not be kept on the plane of emergency telegrams only. In class (*b*) advances in radio-communication methods and apparatus should continue to cause reductions in the cost of maintaining communication with distant countries. In class (*c*) the increasing use of underground cables should tend to relieve radio, with its somewhat restricted gamut of wavelengths, for more useful service in the other two classes.

Radio-telephony might in time eclipse radio-telegraphy, and was subject to the same classification. The possibility of employing the ordinary subscriber's apparatus to talk to ships at sea had already been proved, and relaying of wire-line telephony had even been done after the speech had been transmitted 5,500 miles. It was possible to telephone over much greater distances by radio than over submarine cables, and the recent radio-telephone experiments between London and New York showed how close was its commercial application.

Miscellaneous applications included direction-finding, beacons, leader cables, echo depth-recording, time signals, weather reports, and systems for the amplification of speeches to large audiences. Approximately 260 British ships alone had been equipped with direction-finding apparatus, and 85 stations had been equipped for emitting signals of such a nature as to assist ships in locating their position, or to assist aeroplanes in landing. The echo depth-recording system could be used for depths up to 4,000 metres.

A number of problems still open to the radio engineer for solution were mentioned, and, in conclusion, Mr. Elwell urged that, in order that progress might continue, serious amateur investigators should be accorded liberal treatment.

Discussion.

Capt. R. H. RANGER (engineer to the Radio Corporation of America, who is in charge of picture transmission across the Atlantic) said that during the strike he had been swamped with demands to send pictures from this country to America; in fact, it was almost a question whether the transmission of words or pictures should take precedence. He saw the world as nothing but a small room; a signal from a "beam" station went round the earth and came back and echoed eight times, "so that we are in a small room, and the echoes from the wall disturb us." The combination of the radio compass with the gyroscopic compass was a great advance and had made feasible commercial navigation in and out of San Francisco, where fogs were tremendous.

Dr. W. RUSHTON-PARKER asked whether echo depth-recording could be made continuously from a ship steaming at ordinary speed.

Mr. MENZIES (secretary of the Royal Society of Arts) asked whether the use of the two-electrode valve in connection with the precipitation of dust might not have some practical application in the home.

Lieut.-Colonel H. P. T. LEFROY referred to the possible applications of radio in the navigation of aircraft, where drift was very great, and to the importance of developing methods of preventing collisions of aircraft, in view of the great speed at which two aeroplanes approached each other. There were possibilities in the use of the cathode ray, which would give instantaneous warning of danger approaching.

The CHAIRMAN emphasised the fact that high-frequency engineering traversed all sides of physics, and upon it, therefore, all branches of physics and all applications of physics reacted.

Mr. C. F. ELWELL indicated that he would reply fully to the discussion in writing.

Kolster Radio Compasses.—Arrangements have been completed between the Federal Telegraph Co. and the U.S. Coast Guard Service for the installation of Kolster radio compasses on six more of the coastguard vessels, which will make a total of 17 vessels of the coastguard service equipped with such compasses as an aid to navigation.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

Another "PM" Valve.

One of the latest additions to the "PM" group of valves manufactured by the Mullard Radio Valve Co., Ltd., is a low-impedance pattern which is very suitable for loud-speaker operation. Its constants are as follows:—

Filament voltage	1.4-1.8 volts.
Filament current	0.15 amp.
Anode voltage	50-100 volts.
Total electron emission	20 mA.
*Anode impedance	8,750 ohms.
*Amplification factor	5.4.
*Mutual conductance	0.62 mA/volt.

(*At anode volts = 75 and grid volts = zero.)

The valve and its characteristics are shown in figs. 1 and 2; it is primarily a low-frequency amplifier, and is suitable for

Fig. 1.—Mullard "PM2" Valve.

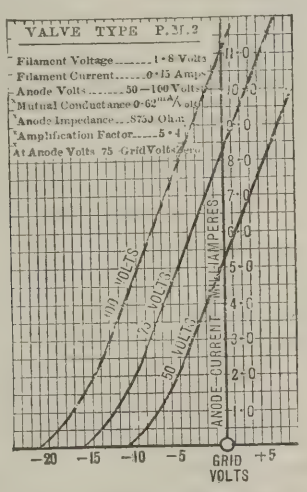

Fig. 2.—"PM2" Power Valve Characteristic Curves.

use when followed by l.f. transformers, loud speakers, or any low-impedance circuit, and negative grid bias voltages of 4, 7 and 10 V should be applied with anode voltages of 50, 75 and 100 V respectively.

When used as a detector the grid return lead should go to the positive limb of the filament and when used for high-frequency amplification an anode voltage of from 50 to 100 may be used. The valve will respond readily to reaction, and its filament is practically invisible when run under correct working conditions; the low working temperature preserves the ductility of the "V"-shaped filament and lengthens its life. Besides the low current consumption another advantage is the large grid swing available; with 100 volts h.p. the grid bias is roughly 20 volts and this permits the valve to deal with strong signals.

The "Remocon" Coil Stand.

A coil stand that has advantages not found in the usual forms of holder is shown in fig. 3, the illustration being self-explanatory. It is marketed by the Economic Electric Co., Ltd., and is used chiefly in American type receiver cabinets,

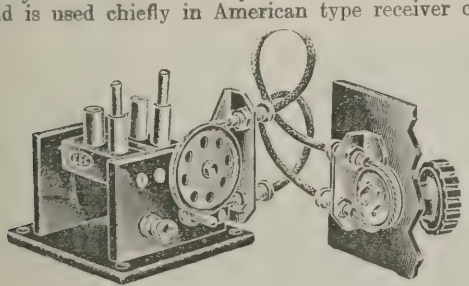

Fig. 3.—The "Remocon" Coil Stand.

the coil stand being fixed in the most convenient position and the control knob mounted remote therefrom elsewhere on the panel without interfering with the working, the movement being transmitted without back-lash by sheathed wires as indicated.

An Hotel Installation.

The wireless distributing scheme which is being installed in the Hotel Cecil London, provides for broadcast reception in the sitting rooms of the different suites of rooms in the hotel. The apparatus is capable of picking up any of the Continental stations in addition to British stations, the super-heterodyne set being used with either frame aerial or outside aerial, the latter having been erected on the roof. A power amplifier raises the volume energy to a level that enables distribution to be made by lead-covered cable throughout to receiving points (of which there are 20) consisting of two single-earpiece lorgnette type receivers and associated key box. The receiver is the well known 7-valve set manufactured by Standard Telephones & Cables, Ltd., will receive on any wave-length between 300 and 3,000 metres, and is simple to operate as there are only two variable adjustments, one being in the aerial circuit, the other in the oscillator circuit. The setting of these two variable condensers is very critical, but the delicate gearing makes the set easy to use. "Wecovalves" are used with bayonet sockets and in order to avoid direct coupling between stages owing to stray magnetic fields, each stage is completely shielded. There are six tuned circuits in the set, of which only two are variable and the frame aerial has its centre point connected to the earth side of the set, which has the desirable effect of improving its directional properties and so increasing the selectivity of the set as a whole. The set is, however, also provided with a special tuning unit which enables it to be used in conjunction with a standard outside aerial.

The two-stage amplifier has a dial switch for controlling the energy delivered into the system and a step-down transformer is provided in order that the output impedance of the amplifier shall balance the impedance of the load into which it works. The power valves need 6 volts for the filament circuits and 120 volts for the anode circuits. Two main feeder cables supply each floor, terminating at small distributing boxes and at the amplifier end on a terminal board arranged so that testing the main cables is an easy matter. The main cables (of which there are ten) consist of No. 18 S.W.G. twisted-twin v.i.r. and l.c. cable. From the distributing boxes on each floor similar lead-covered twin cable extends to each of the receiving points, the cable used for this purpose being No. 22 S.W.G. twin enamelled d.c.c. and l.c. cable. The reason for the use of two distributing boxes on each floor is that should a fault develop in any part of the system on the cabling, it will only be necessary to cut off one-half of one floor whilst such a fault is traced and repaired. The receivers normally hang upon hooks on the wall and a small key box is also provided at each receiving point which contains a switch so that when the receivers are disconnected from the line, in place of them a resistance is connected of such value that it is equivalent to the joint impedance of the two headphones in parallel. The actual load on the system, therefore, is the same whether the key is in the operating or non-operating position, and the volume of sound received at any particular receiver point will be the same irrespective of the number of receiving points in use. The whole of the apparatus in use throughout the system has been supplied by Standard Telephones & Cables, Limited.

Universal Coil Holders.

Coil holders that will appeal to "constructors" on account of their applications are illustrated in figs. 4 and 5, being a product of the Igranic Electric Co., Ltd. The spacing between the contact pin and socket may be varied from 9/16 up to 2 in., rendering the holders suitable for accommodating standard plug-mounted coils, or low-loss coils having widely spaced contacts, such as Igranic "XLLOS" coils, in which the spacing of the contacts may be varied in a similar manner. The pin

Figs. 4 and 5.—Igranic Coil Holders.

and socket are separated by an air space which confines the self-capacity of the holder to a low value. The contact pin may be removed by unscrewing, thus providing for mounting coils having two contact pins. The limbs being independent units, one, two, or three of them may be used as single, two-way, or three-way holders. Ebonite extension handles which facilitate operation and obviate hand-capacity effects are supplied with the two-way and three-way combinations, and the metal parts are nickel plated.

A.T.M. Contributions to Liverpool Hospital.—During the year ended May 29th last the employés of the Automatic Telephone Manufacturing Co., Ltd., raised, by means of a "Saturday fund," £405 for the Liverpool Hospital. Since the fund was instituted in 1912, £2,055 has been contributed to the hospital.

An Experiment in "Customer-Ownership."

Success of a Recent Stock Issue in Canada.

By R. E. TURNBULL.

"CUSTOMER-Ownership" means the owning of the shares in a public utility company by local residents. The advantages of this system are that it is the best method of maintaining the goodwill of the public. If the shares of a company are held by the people who every day make use of the services of that company, it becomes something in the nature of a co-operative society. The public take a greater interest in it and know they are benefiting by any profits it makes. It relieves the company of many false accusations of profiteering. If a man possesses even one share it gives him a sense of ownership and a feeling of pride and patriotism when he sees the business is worked efficiently and on a paying basis.

The idea has of late years become very popular in the United States and Canada, and it was for the reasons given that, a few months ago, the British Columbia Electric Railway Company, Ltd., turned its attention to this method of raising fresh capital.

Readers of the ELECTRICAL REVIEW have long been familiar with the operations of this company, but a few words here about its status will be of interest: It was incorporated in 1887, and has since grown to be a very large undertaking. It supplies transportation, electric light, heat and power and gas, over a territory of 1,500 square miles on Vancouver Island and on the lower mainland of British Columbia in the vicinity of Vancouver and district. The capital expended in the province already amounts to about £14,000,000. The company has 3,000 employés, 87,000 light and power customers, and 30,000 gas customers. There are seven hydro-electric power plants with a total capacity of 202,000 h.p., and it is principally for the purpose of increasing this power capacity and developing the Bridge River site, where a further 700,000 h.p. is available, that fresh capital is required.

Hitherto, the difficulty in selling stocks or shares of the B.C.E. Railway Co. in British Columbia has been the fact that the company is an English company, with its capital in pounds sterling, and its dividends and income subject to English income-tax. For this reason, a subsidiary of the railway company was incorporated in British Columbia and called "The British Columbia Electric Power and Gas Co., Ltd."

The railway company had in the past owned the capital stock of a number of subsidiary companies, such as the Vancouver Power Co., Vancouver Gas Co., Victoria Gas Co., B.C. Rapid Transit Co., &c. The capital stock of all these subsidiary companies was purchased by the new company for $15,248,012, in return for which it issued to the B.C.E. Railway Co. common stock for the same amount. The new company then made an issue of $5,000,000 of 6 per cent. cumulative preference shares whose dividends were guaranteed by the parent company. Of this amount, only $2,250,000 was offered to the public, $1,500,000 being underwritten by a syndicate of bondholders, and the remaining $750,000 (about £150,000) allotted to employés of the company, either to buy for themselves or sell to local residents. The price was $99 to the public. Applications for shares were restricted to 50 shares each, and had to be from residents of British Columbia.

The advertising campaign was scheduled to begin on March 19th, and the selling on March 20th, but news of the impending issue aroused such interest that the forms had to be released on March 15th. On the first day, almost the entire original allotment to employés had been sold. The prospectus stated that the subscription list would be closed on March 31st, but it had to be closed on March 20th, and the company had to request employés to do no more canvassing.

When the final results were complete, it was seen that the company, which had expected to sell $750,000 shares through its employés, had received applications for $5,650,000, and that the employés had subscribed for no less than $602,000 themselves.

The outcome of the "customer-ownership" campaign is that many records have been broken, not only for Canada, but for the whole of the North American continent. Only two companies on the continent are known to have more "customer-owners" in proportion to their customers, and then only after several years of effort. Another record for the first sale is that 47 per cent. of employés of all branches on the permanent pay-roll now own shares in the company. This wonderful response to the issue may be attributed to the high reputation for efficiency, progress, and good service which the company has attained among the residents of B.C. and the fact that a spirit of courtesy has been encouraged among its employés when dealing with the public. The company has lowered its rates repeatedly whilst the large amount of capital spent in the province has been a great help to industry and general development.

The B.C. Electric will now have 11,000 shareholders in the province of British Columbia. These shareholders are not "capitalists" in the ordinary sense of the word, but small investors, such as clerks, labourers, school-teachers, artisans, professional men, &c., who have invested their savings in this local business, and will watch its progress with added interest.

Commenting on the issue and its result, Mr. George Kidd, president of the B.C.E. Railway Co., Ltd., writes:—"W timidly thought of asking our patrons for $1,000,000, or po sibly $1,500,000, and ultimately, with some misgiving, fixe on $2,250,000. But what has happened? In less than week applications for $7,155,400 were in our hands, and whe we closed the list they were still pouring in. Our succes has been almost embarrassing. We really do not need a this money just now, but, rather than disappoint our friend more than is absolutely necessary, we decided to accep $5,000,000. And now a word about our employés. For th confidence so abundantly displayed by the public, we are i a large measure indebted to the efficiency and courtesy of ou employés. The goodwill which has been built up, largel by the employés themselves, enabled them, when asked t sell $750,000 of our shares, to bring in 10,245 applications fo $5,655,900. Surely an astonishing record!"

The Water-Power Resources of Canada.

THE annual review of the water power resources of Canada issued by the Dominion Water Power and Reclamation Ser vice of the Department of the Interior, states that the yea 1925 witnessed the unprecedented increase in Canada's hydro electric installation of 718,984 h.p., bringing the total installa tion for all purposes to the imposing total of 4,290,428 h.p., o 465 h.p. per 1,000 of population. While actual construction during 1925 was confined to only four of the provinces, British Columbia, Manitoba, Ontario and Quebec, considerable acti vity preliminary to construction was evidenced in other pro vinces. While it is hardly to be expected that 1926 wil witness activity equal to that of the past year, there is suffi cient construction under way or in prospect to maintain the high average of recent years. That the limit of individual plant capacity has not been reached even by the great stations recently constructed is indicated by the inception of a plant on the Saguenay River of 800,000 h.p. ultimate capacity, while plans for an enterprise of almost equal ultimate capacity on the Bridge River in British Columbia involving the develop ment of a series of sites are in course of preparation. The known available water power in Canada, from all sources and within the limitations outlined, is 18,255,000 h.p. for conditions of ordinary minimum flow and 32,076,000 h.p. ordi narily available for six months of the year. It is believed that these are conservative estimates since an analysis of the water power plants scattered from coast to coast concerning which complete data are available as to turbine installation and satisfactory information as to stream flow, gives an average machine installation 30 per cent. greater than the ordinary six-month flow power. Applying this, the figures quoted above, therefore, indicate that the present recorded water power resources of the Dominion will permit of a turbine installation of 41,700,000 h.p. The present turbine installation represents only 10¼ per cent. of the recorded water power resources. The following table shows the distribution and development of hydro-electric resources:—

Province.	Available 24-hour power at 80 per cent. efficiency. At ordinary min. flow, h.p.	At ordinary 6-months flow, h.p.	Turbine installation h.p.
British Columbia	1,931,142	5,103,460	414,702
Alberta	475,281	1,137,505	34,107
Saskatchewan	513,481	1,087,756	35
Manitoba	3,270,491	5,769,444	183,925
Ontario	4,950,300	6,808,190	1,784,842
Quebec	6,915,244	11,640,052	1,747,386
New Brunswick	50,406	120,807	44,631
Nova Scotia	20,751	128,264	65,327
Prince Edward Island ...	3,000	5,270	2,274
Yukon and Northwest Territories	125,220	275,250	13,199
Available and developed water power in Canada: Totals ...	18,255,316	32,075,998	4,290,428

During 1925 the new installation in Quebec was 438,300 h.p., of which 360,000 h.p. was contained in a single station on the Saguenay River. In Ontario practically 200,000 h.p. came into operation, of which nearly three-quarters was due to the efforts of the Hydro-Electric Power Commission, leaving a substantial remainder to the credit of private enterprise. In Manitoba no new stations were established, but an existing plant was enlarged by 22,000 h.p. In British Columbia water power activities were marked and nearly 90,000 h.p. was installed.

The 4,290,428 h.p. at present installed throughout the Dominion is apportioned to the following uses:—3,466,422 h.p. (80.8 per cent. of the total) in central electric stations for general distribution; and 481,971 h.p. (11.2 per cent.) installed in pulp and paper mills. In addition pulp and paper mills purchase about 275,000 h.p. from central electric stations, making a total of nearly 757,000 h.p. used in the manufacture of pulp and paper. 342,035 h.p. (8.0 per cent.) is installed in industries other than central electric stations and pulp and paper mills.

At the present time there are 297 hydro-electric central stations in Canada, and of this total 209 stations, with a combined capacity of 2,230,848 h.p., are owned by commercial organisations, while municipal or other public organisations operate 88 stations with an aggregate possible output of 1,235,574 h.p.

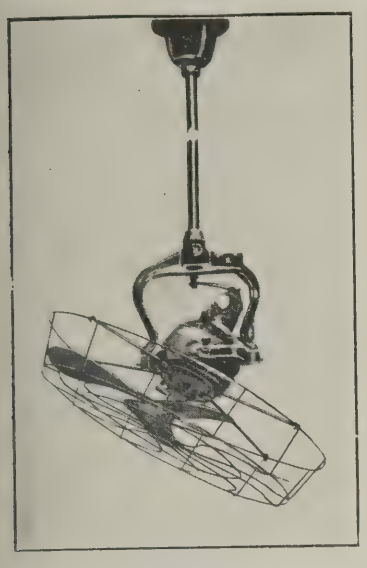

Fig. 1.—Ceiling Fan.

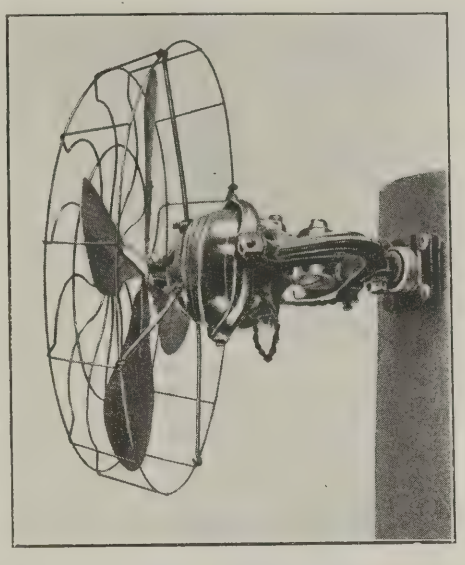

Fig. 2.—Wall Fixing.

The fortunate existence of enormous supplies of pulp wood in close proximity to the water powers, which are readily developable and sufficient to furnish the large quantities of power demanded by this industry, has placed Canada in the favourable position she occupies in this direction. A recent development of interest affecting the power consumption of this industry is the rapid adoption of electric boilers as a means of transforming any surplus of available electric energy into steam for pulp cooking, drying, heating, &c.

The modern development of water power in Canada began with the last decade of the nineteenth century by the end of which approximately 170,000 h.p. had been installed. Since then there has been an ever-growing rate of progress which brought the total to 4,290,428 h.p., culminating in the record installation of 1925. With new uses for electricity constantly appearing there is every reason to believe that the past growth will not only be continued, but accelerated. Chief among these new uses may be enumerated the electrification of steam railroads, the application of electric heat to manufacturing processes, the extension and use of electric boilers for process steam, electric refrigeration, and the many other domestic and commercial uses constantly appearing. A conservative estimate of the capital investment in Canadian water powers amounts to $815,723,890.

Electric Fans.

The Production and Dispatch of the Orbit Oscillating Fan.

With the approach of the summer months the electrical manufacturing and contracting industries are directing their energies to meet the anticipated demand for electric fans, which increases by leaps and bounds every year. We have received from Messrs. Veritys, Ltd., some particulars of the special steps which they have taken to deal with the demand this year, both at home and abroad. A complete range of the new "Orbit" 1926 elliptical oscillating fans (patented throughout the world) is being marketed. The majority of oscillating fans at present on the market travel backwards and forwards in a horizontal plane; but there is a demand for a fan covering a larger fanning area, and it is to meet this demand that the "Orbit" has been produced. It is claimed that the oscillating movement of this machine is unique. It is partly vertical and partly horizontal, resulting in an elliptical movement with an increased area. The fans are suitable for desk, bracket, or ceiling fixing. For the ceiling fans, fig. 1, the oscillating movement is slightly different, being more circular than elliptical, and an angle of 30 deg. from the horizontal is maintained by the fan blades. A special shoe into which the fan securely locks is provided for low ceilings, a downrod and shackle being provided for high ones. In addition a tilting device allows the operation to be directed to different parts of the room, if required, without disturbing the fixing arrangements. This fan, it is claimed, works equally well when fixed to a wall, fig. 2. No brushes or electrical contacts are employed in connection with the movement, and the fan should prove particularly suitable for places where it is not convenient to use the pedestal type. An important feature in the distribution of their products is the employment by the makers of a special means of packing. Each fan is packed separately and fully assembled in a strong cardboard box, fig. 5, so that it arrives at the consumer's end ready for immediate use. No straw or similar packing is used and the internal dimensions of the box are only just sufficient to accommodate the fan. Very consider-

Fig. 3.—Packing Department.

Fig. 4.—Fan-Assembling Shop.

Fig. 5.—The "Orbit," Packed.

able thought has been given to the packing of these fans, and many experiments were carried out before it was considered that a desk fan could be dispatched complete in a cardboard box ready for re-distribution. It is realised that prompt delivery in the fan trade is as important as low prices, and arrangements have been made to keep large stocks of fans for all voltages and periodicities ready for immediate dispatch the same day as they are ordered.

The whole of the fans are made throughout at Messrs. Veritys' Aston Works, Birmingham, where special fans are built to suit the particular requirements in different parts of the world. Fig. 4 is a view of the assembly shop at these works and fig. 3 shows the packing department.

Russian Notes.

The Pskoff Province.—The authorities of the Pskoff province have prepared a five-years' scheme of works of electrification, comprising the construction of hydro-electric works in Pskoff and Novorsjevsk. A hydro-electric works has just been completed in Ostroff. Ten peasant associations are also being formed for the execution of electrical schemes.

The Quality of Manufactures.—As a result of complaints made by the Commission for Ways and Communications and of other large customers concerning the inferior quality of certain electrical manufactures, an investigation is being made by the General Electrical Commission assisted by experts. The inquiry has already extended to the Moscow Cable Factory and the United Lamp Works, and the turn of the Insulator Works is about to arrive. It is proposed to exercise control over the quality of manufactures as a consequence of the investigation.

Inferior Electric Lamps.—The Central Laboratory of the Leningrad Electric Current undertaking has carried out a series of tests with lamps made by the Svetlana factory and the Moscow works of the State Electrical Trust. As a result it has been found that nearly all the lamps require double the quantity of energy which they should consume. The inferior quality of the lamps is attributed to the bad condition of the wolfram filaments. In these circumstances the factories concerned have been asked either to take measures to remedy the evil or to discontinue manufacture.

Works Managers in Conference.—During May a conference took place in Moscow of the managers of the different departments of the works embodied in the amalgamated heavy electrical engineering undertakings known as the State Electrical Trust. It was pointed out that many manufactures, which in pre-war times were imported from abroad, as for instance lamps, h.p. insulators, and large generators and transformers, were now turned out at the works of the amalgamated trust. This fusion has made possible the more economical use of the technical resources, but much remains to be done in this direction. In the course of further development it is considered necessary for a more systematic exchange of experience to be made with other countries and also between the different works in Russia. It was stated that the capacity of the home market considerably exceeded the growth of the production, particularly with regard to standard three-phase and d.c. machines. At the same time it was admitted that the quality of some manufactures turned out was low and improvement was essential.

The Donetz Anthracite Mines.—According to information received by the Donetz Coal Trust, the works being carried out at the Shteroff generating station are approaching completion and the station will be able to afford a supply of energy in September or October. The sub-stations are in an advanced state and the overhead lines have been erected, while the mines are being equipped with electric motors, centrifugal pumps, &c. Altogether the anthracite pits of four mining managements will be electrically equipped by next year.

The Coal Trust and the North Caucasian District Planning Commission are now in negotiation with a view to the construction of a large generating station in this region.

Turbine Construction.—The Leningrad Machine Trust has placed before the Industrial Bureau a statement concerning the construction of turbines, which was commenced at the works of the trust in the year 1922-23. Since then the trust has completed and erected 12 turbines of from 500 to 10,000 kW and of a total capacity of 28,750 kW. At present the trust has in hand 17 turbines of a total of 48,000 kW, while inquiries have also been received for a further 84 turbines. In order to meet the requirements the trust states that it is necessary to extend the works at a cost of 4,866,000 roubles, the extension being spread over three years.

Hydro-Electric Power for Leningrad.—According to a report presented to the Electric Planning Commission by M. A. I. Fidman in connection with the growth of the consumption in Leningrad, the stations supplying that city down to the time of the war used English coal as fuel, but at present they are working on wood, naphtha, and peat. It is considered that the future supply should be obtained from water power; the river Sver offers the greatest facilities for the purpose as it would permit of the erection of three stations of a total of 150,000 h.p. and thus be able to assist in meeting the requirements of Leningrad until 1934.

Pulverised Coal.—The Electric Planning Committee has authorised an expenditure of 17,000 roubles for the purpose of experiments in the consumption of pulverised coal at the "first" Leningrad generating station.

Railway Electrification.—The Council of Labour and Defence has approved a scheme of railway electrification prepared by the State Planning Commission for a period of five years, leaving the financial provision to be settled at the beginning of each budgetary year. A total expenditure of 101,000,000 roubles is contemplated in the five years, of which 4 millions is being spent this year; 13¼ millions is proposed for next year, 22 millions in 1927-28, 27 millions in 1928-29, and 35 millions in 1929-30. Besides the suburban lines in Moscow and the North, which have been referred to on former occasions, the project includes the conversion of the Leningrad lines, and those at Alexandrovsk, Kursk and Nischni-Novgorod.

Railway Construction.—It was recently announced from Baku that the construction of the Sabunchi electric railway was approaching completion. The overhead line between Baku, Sabunchi, and Surachani was ready, and the opening of the railway was expected to take place in February.

Electricity from Finland.—It is announced from Leningrad that the question of purchasing energy from the hydro-electric works now being established on the River Vuoxen, Finland, has been settled. Negotiations are now proceeding with regard to the time of delivery and the construction of the transmission line of a length of about 132 miles. The station in question is to be completed by the end of 1927 and according to the agreement entered into, a supply to Leningrad is to be effected at the beginning of 1928, the demand being 40,000 kW, increasing later to 60,000 kW. The transmission line and technical equipment will be defrayed out of funds provided by the Supreme Council of National Economy.

A Large Station.—It is reported from Kharkoff that preparatory works have been completed for the construction of a large generating station in the town of Chugueve, which will supply energy in the district of Kharkoff. The initial capacity will be 32,000 kW, and will subsequently be increased to 82,000 kW. It is said that the necessary machines have already been ordered from abroad, and that 2,000 men will be employed on the erection of the buildings this summer.

Budget Assignments for Electrification. — The State Planning Commission has approved the method of allotting the total sum of 69,100,000 roubles assigned in the budget for 1925-26 for works of electrification. Of this total the sum of 40 millions is proposed to be devoted to the extension of the regional stations of primary importance, 9,710,000 roubles to the secondary stations, and the balance to other works.

The Productive Programme.—As the highest controlling authority in the matter, the Council of Labour and Defence has just approved the productive programme of the electrical manufacturing industry as submitted by the Supreme Council of National Economy. According to this programme, the output of the industry is to exceed by 63 per cent. in 1925-26 that of the past year. But even the realisation of the scheme will still leave it impossible fully to satisfy the requirements of the country, as the absorbing capacity of the market is now twice that which was manifested in the pre-war period. The value of the gross production in 1925-26 is estimated at 104,900,000 pre-war roubles. The capital expenditure will be 13,000,000 roubles, almost all of which will be devoted to the extension and re-equipment of the existing manufacturing works. With the object of reducing the exceptionally high costs of producing machines and apparatus, the obligation has been laid upon the Supreme Council to see that mass production is undertaken and to take steps to ensure the development of the supplies of raw and semi-finished materials for the electrical industry. At the same time measures are to be taken to increase the efficiency of labour which is said to be disproportionate to the rates of wages which are now paid.

The Volkhoff Hydro-Electric Works.—Having returned from a lengthy stay abroad, Mr. Graftio, the chief engineer of this works, is reported to have stated that he had ensured the delivery of the plant ordered abroad. All accounts had been regulated with the Vickers Co., which had executed the orders given, but had held back the delivery. The works would be ready next December; the erection of seven turbines and four generators had been completed. It was expected that energy would be available from two sets in September.

Telephone Development.—According to a report presented by the electrical section of the Commission on the Restoration of Capital in Industry, the increase in telephone apparatus amounted to 16 per cent. in 1923, 16.3 per cent. in 1924, and 27.5 per cent. in 1925. In order to meet the demand in the present year it will be necessary for the Low-Pressure Trust to manufacture 85,000 telephones and 40,000 line switchboards. The further expansion comprises the production of 100,000 telephones in 1926-27 and 60,000 line switchboards, and 110,000 and 70,000 respectively in 1927-28. At the end of five years the output of telephones must be 125,000, while it is foreshadowed that the manufacture of telegraph apparatus will be diminished in that period.

The Krivoi-Rog Ore District.—A scheme is under the consideration of the Southern Mining Trust for the construction of a works of a capacity of 30,000 kW for the purpose of supplying power and light to the iron ore mining district of Krivoi-rog. By way of a beginning it is proposed to install two 10,000-kW generating sets.

A New Form of Electric-Hydraulic Steering Gear.

By Dr. H. S. HELE-SHAW, F.R.S., and T. E. BEACHAM, B.Sc.

(*Abstract of a Paper read before the* INSTITUTE OF MARINE ENGINEERS.)

THE paper describes some improvements which have recently been introduced in the electric-hydraulic system of steering for ships.

The electric-hydraulic system has been successfully adopted in the Merchant Service, not only for motor vessels but for steamships, and has also been employed by most of the principal navies of the world. No matter what success an invention may have, experience is sure to lead the way to further improvement, and in the new steering gear the following new features have been adopted :—A new, and it is believed, greatly improved variable stroke pump; a control valve for obviating the necessity of reversing the pump itself; and an automatic valve for preventing shocks from the action of the waves on the rudder causing any injury to the structure of the ship.

The pump, which is of the radial, central-valve type, is an improvement on the original Hele-Shaw pump in its application to the steering gear. In place of the rotary cylindrical valve taking the thrust on the cylindrical surfaces, the valve of the new pump runs on roller bearings. Instead of the pressure necessitating two different metals of unequal expansion to secure proper wearing action, the two parts can be made of the same metal (say, cast-iron), and thus very little clearance is necessary, assuring at all temperatures a minimum of leakage or slip. When the steering gear runs for a long period in the zero position, the danger of heating and abrasion of the cylindrical valve is entirely obviated. Thus it is not then necessary to arrange for leakage of oil (often considerable) to ensure lubrication. Another great improvement is in the greater silence of the new pump. The cause of the disagreeable buzzing sound in the old pump has now been discovered, and is entirely obviated in the new pump.

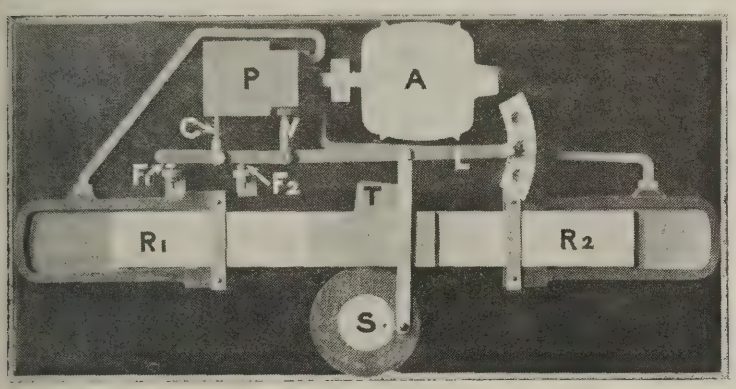

Fig. 1.—Model of Hele-Shaw Steering Gear.

The control valve does not rotate, but has merely a movement in the direction of its axis, enabling a working fit to be obtained, and resulting in an almost complete absence of leakage. The movement of the valves takes place from the central position; while the flow from the pump is always in the same direction before it reaches the valve, its flow from the valves to the two ports for the rams can be reversed. The stroke of the pump is governed by means of the pump spindle on one side of the zero position. Fig. 1 represents a working model, A being the electric motor, P the pump, R_1 R_2 the rams operating directly on the tiller T, and so producing the required movement of the rudder post S, L is the floating link, F_1 F_2 the two fulcrums. It will be easily seen that the two fulcrums produce exactly opposite movements on the pump spindle and control valve spindle respectively. A steering gear of this type has been made for a motor yacht and will replace the hand steering gear now in operation.

The new valve for preventing shocks on the rudder from being communicated to the deck of the ship is arranged to act when the rams by their reversed motion, provide a pressure of less than half the maximum in the cylinders

---

Economy and the Minimum Charge.—The recent order made by the Mines Department called for a reduction in the consumption of coal, electricity and gas. As most electricity authorities have instituted a minimum charge to (*inter alia*) encourage the greater use of energy, an interesting point is raised, *viz.*:—Will consumers, who naturally endeavour to reach the minimum consumption, be encouraged to economise if the minimum charge is still insisted upon? The only effort to meet the situation which has so far come to our notice is that of the Electric Supply Corporation, Ltd., at Chelmsford, which has decided not to enforce the minimum charge during the continuance of the coal stoppage. It is probable, however, that the matter is engaging the attention of other suppliers.

Legal.

False "Characters" Charge.

BEFORE the Lancaster Borough magistrates, on May 30th, R. C. Milner, an electrical engineer, recently employed at the Upton Mental Hospital, Hoole, near Chester, was summoned under the Servants' Characters Act, 1792, for making false representations in that he unlawfully pretended to Major G. C. Milnes, electrical engineer to the Lancaster Corporation, that he had been in the service of the Bolton and Salford Corporations, whereas he had never actually so served. Two summonses had been issued, and defendant, who was represented by Mr. J. P. Elsden, barrister, Chester, pleaded guilty.

The Town Clerk of Lancaster (Mr. R. M. Middleton) who prosecuted on behalf of the Lancaster Corporation, said that the information was originally laid in August, 1925, but there had been difficulties in serving the summons because the defendant absolutely denied he was the man concerned. In July, 1925, Major Milnes advertised in the ELECTRICAL REVIEW for a shift charge engineer. Twenty-five applications were received, amongst them one from the defendant, signed "R. C. Milner." The application was very striking, and defendant interviewed Major Milnes, who told him that his face was familiar. Defendant suggested that he might have seen him in the Engineers' Clubs in Manchester or London, but Major Milnes was not a member of either club. Major Milnes then recalled an interview with a "Rollo Milton" in 1923 regarding an application for the position of mains superintendent. He came to the conclusion that they were the same person. Further inquiries disclosed that Milner did not possess the experience claimed in his application, and the testimonials were not from the people he pretended they were from. He had never been in the service of Bolton, Salford, or Eccles. With reference to a statement that he was three years senior engineer with the Leicestershire and Warwickshire Electric Power Co., he was only there three weeks. When the company doubted his competence and called for his original testimonials, he said he would go to Manchester for them, but never returned. The Town Clerk said that a serious state of affairs was revealed. Had this man been placed in charge of a plant valued at £100,000 the whole of the town's electrical undertaking might have been in jeopardy. A long statement was received from the Electrical Power Engineers' Association, which the Town Clerk contended should be read in the interests of the public service, but the Bench would not admit it.

Major G. C. MILNES, borough electrical engineer, Lancaster, gave evidence, and said that he placed defendant on his short list purely on his paper qualifications when he applied for the position.

Mr. W. J. H. WOOD, electrical engineer at Bolton since 1913, said he had never seen the defendant before, and he had never given the defendant the testimonial produced. The statement that he was in the department four years was incorrect.

Mr. J. COLLINGE, works superintendent of the Salford Electricity Department since 1901, said he had never seen defendant, and had never given the testimonial produced.

Mr. ELSDEN, while agreeing the offence was serious, said the suggestion that the works might have suffered by the defendant's employment had not been supported by evidence. Defendant applied for membership of the Electrical Power Engineers' Association, but did not pay his subscription. He thought because he was not a member of that association he was being victimised, and conceived the idea of applying for a job in an assumed name.

The magistrates fined defendant £10 in the first case and £5 in the second, and ordered him to pay £5 5s. costs, or in default two months. He was given time to pay.

Reduction of Telephone Manufacturing Co.'s Capital.

IN the Chancery Division, on June 1st, Mr. Justice Romer heard a petition for sanction to a scheme of arrangement which involved the reduction of the capital of the Telephone Manufacturing Co., Ltd.

For the company, Mr. BISCHOFF said the company, with a capital of a million pounds, had had considerable success, and required further money for the business; the proposed scheme had been prepared for that.

On behalf of two shareholders, Mr. JOHNSTON said he opposed the petition, because there was nothing in the nature of arrangement about the scheme.

His Lordship approved the scheme, subject to certain variation, and dismissed the opposition.

Nelson Electric Co., Ltd.

IN the Companies Winding Up Court, on June 1st, Mr. Justice Romer heard a petition for the compulsory liquidation of the Nelson Electric Co., Ltd., presented by Mr. Eugene Durand, trading as C. Melin & Co., and Eugene Durand & Co., judgment creditor.

Appearing for the petitioning creditor, Mr. GEOFFREY HOWARD said the debt was for £763 9s., which was in part

for goods sold and delivered and in part for bills of exchange given for goods, and since judgment had been obtained on May 14th further bills had matured; the total amount now due to the petitioning creditor was £1,100. A list of other creditors had been handed in, representing a total of indebtedness of the company of £2,369. It appeared that shortly before one of the bills fell due debentures of £1,000 were created, and on April 23rd a receiver was appointed for £600 worth of those debentures, and had since carried on the business of the company.

For the company Mr. MOULD opposed a winding-up order, and read an affidavit of Sir William Henry, director and chairman of the company, from which, said counsel, it appeared that the company's complaint was that it was being made to pay for goods for which it was not liable and that it had not got full value for stock which it had bought. The company had been mishandled in the past, but there was confidence, now, of arranging a scheme to liquidate the company's liabilities in full.

Counsel, therefore, asked that the petition be allowed to stand over, and his Lordship granted an adjournment.

Compensation Awarded to Irish Electric Supply Co.

AT the Circuit Court, Killarney, County Kerry, before Judge E. J. McElligott, K.C., recently, Messrs. Mortimer Shea and John Sheehan, trading as the Kenmore Electric Supply Co., applied for £500 compensation in respect of a portion of machinery and plant of the concern that was destroyed on March 8th last at Gortahinny. After hearing the evidence, the Judge gave a decree for £60, to be levied of the Kenmore and Cappagh electoral divisions of the County Kerry, and allowed £4 4s. expenses.

Electrical Engineer Sentenced.

CHARLES B. SMITH, described as an electrical engineer, of Plymouth, was sentenced to three months' imprisonment by the local magistrates last week on five charges of theft and false pretences.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

The Resistance and Heating of Plunger-type Lampholders.

The comment made by Messrs. A. P. Lundberg & Sons in their letter in your issue of May 28th, and the article on page 689 in your issue of April 30th on the above subject, are very interesting to us, and we venture to suggest that the remedy to overcome this difficulty and the other weaknesses of plungers is to dispense with the plungers. In the J.K.W. Solid Contact Lampholder this is done without material alteration to general design, method of wiring, or appearance.

The J.K.W. Manufacturing Co., Ltd.
J. WILSON, *Director.*

Middlesbrough, *May 28th*, 1926.

Earth Tubes in Radio Sets.

I have read with interest Mr. Killingworth Hedges's letter in the "Correspondence" columns of the REVIEW for June 4th, in connection with my article on earth tubes in radio sets.

I quite agree with Mr. Killingworth Hedges that the efficiency of an earth pipe is as dependent upon its specific conditions as that of a connection made to a water pipe, and although I did not actually state this in so many words, I think I implied it in the latter part of my article.

I am afraid that I am not exactly clear as to the actual construction of the hollow earth pipe referred to, and the exact manner in which it functions during the dry weather. What is necessary, of course, is that the earth tube, plate, or whatever is used for the earth connection should be permanently in electrical contact with a large area of moist ground in the immediate vicinity of the aerial, and preferably directly beneath it. The statements in my article are based entirely on results obtained from water pipes, earth plates, mats, and the ordinary type of earth tube driven into the ground, the data having been obtained from a number of different localities, where various types of subsoil and ground conditions were available.

I note Mr. Killingworth Hedges's remarks concerning the particular tube, and I should certainly be very pleased to test one of these devices, which, I understand, are made by the G.E.C., should an occasion present itself.

Paul D. Tyers.

Watford, *June 7th.*

[The earth tube devised by Mr. Hedges was described in the ELECTRICAL REVIEW of May 3rd, 1918, and May 30th, 1924.—EDS. ELEC. REV.]

The Electrical Association for Women.

Annual Meeting and Luncheon.

THE first annual report of the Association, presented at the annual general meeting on June 4th, states that it was inaugurated in 1924 to interest and serve the cause of women in things electrical. The idea was first mooted by Mrs. M. L. Matthews, a member of the Women's Engineering Society, and that Society undertook the work of organisation. Great strides have been made since its inception, three branches having been formed—at Glasgow, Manchester, and Birmingham respectively. Other branches are in process of formation in S. Wales and Newcastle. Lectures and visits to places of interest were arranged for members throughout the year, including visits to power stations, electrical showrooms, and the E.L.M.A. Lighting Service Bureau, and lectures on the replacing of fuses, &c. The Association also arranged during the year a special course of evening lectures for saleswomen engaged in the electrical industry. These lectures proved to be a great success, and will be repeated in the coming autumn.

The Association is assisting in organising a big women's meeting in Glasgow on June 17th, in connection with the I.M.E.A. Convention. Dr. Christina Barrowman will lecture on the "Remedial Uses of Electricity."

The Association has received support from such bodies as the Institution of Electrical Engineers, the British Electrical Development Association, the Cable Makers' Association, and many other important electrical organisations. It has also been in touch with many electrical organisations in America, and sent a delegate to the National Electric Light Association's Convention at Atlantic City in May.

The Association gave evidence before a Committee set up by the Electricity Commissioners, on the Development of Domestic Electricity, this being the first time the Government heard the woman's point of view on matters electrical.

The immediate development of the work of the Association is the issue in June of a quarterly magazine to be called "The Electrical Age—for Women." This magazine will deal with practical matters of interest to women in the home and electrical housecraft generally.

At a luncheon following the meeting, Lady Cowan, vice-president (in the unavoidable absence of the president, Lady Astor, M.P.), presided over a large gathering of members and guests. After the loyal toast, Lt.-Col. Wilfrid Ashley, M.P., Minister of Transport, proposed "Electricity in the Service of Women," and described the Association as a very vigorous infant, 18 months old. Selling electricity was, he said, as important as generating it; that branch of the industry had not been pushed as well in this country as in the United States and Canada, where electricity in the home was a commonplace—here it was the exception. He used nothing but electricity to warm his own house. Let them all co-operate in putting the Electricity Bill through in the best possible form at the earliest possible moment—continued uncertainty was not good either for the industry or for the country, and the Government was willing to consider any suggested improvement in the Bill.

LADY COWAN, supporting the toast, said that electricity if properly used would relieve the burden of women and other workers, and the E.A.W. was going to remedy our backwardness by creating a demand for electrical and mechanical devices. Electricity, as she had recently seen, was a great help in the United States. The all-electric house ideal was nearer now owing to the interest of women in the subject.

SIR HUGO HIRST, proposing "The Electrical Association for Women," pointed out that British manufacturers, having to cope with 40 or 50 different systems of supply, could not avail themselves of mass production, and it was not their fault if electricity could not be supplied or goods manufactured as cheaply as they should be. He welcomed the Bill and hoped for the results that were so important to the Association. Men were not so well qualified as women to sell apparatus for the home to women; but this was not merely a question of selling, it was a question of service. To give that, the members must undergo training, and it was certain that if they took the matter seriously, they would find opportunities for remunerative employment. The servant question was going to be as prominent here as in the United States, and women would have to use labour-saving apparatus.

Responding, LADY BROOKS, C.B.E., J.P. (president of the Birmingham and Midlands Branch), said the E.A.W. came into existence at the right moment. The Birmingham Corporation undertaking was going ahead rapidly owing to the opening of showrooms; the work of women would hasten the process. They had to convert the conservative-minded working women to new ideas.

Alderman Mrs. HAMMER (chairman, E.A.W.) proposed "Our Guests," remarking that it was the first official birthday of the Association, which was growing rapidly. There were many all-electric houses in England, and more to come, as well as a "university" for training women. The Association had many good friends, and all were united in the common aim.

Mr. R. P. SLOAN, C.B.E., responded, and remarking that he had been accused of obstruction to the Bill, said that nothing was further from his desire. *Some* legislation should be carried through, and the opposition was constructive, not destructive. The phenomenal growth of the business in the North-East Coast area showed that he was out for the most

rapid development that was possible. A Bill was necessary, but the results would be disastrous if it were not framed on proper lines, and very important amendments were required. The excessive legislation in past years had bred constant uncertainty; they wanted a rest, and to get on with the job. He deprecated interference with private enterprise; the Bill, if passed in its present form, would hamper development. The experience of the recent strike had shown users of electricity that they could rely on a continuous supply. If all worked together, in a few years they would be up to the level of the United States and Canada—Bill or no Bill.

Reviews.

The Red Club. By H. R. TAUNTON. Pp. 282. London: Hurst & Blackett, Ltd. Price, 7s. 6d. net.

In this well-written and highly imaginative novel, Mr. Taunton, who is an electrical contractor and an old contributor to our pages, paints the possible consequences of the election of a Bolshevist House of Commons with such obvious sincerity and with such plausibility that the reader is relieved to find at the end that there is still hope for Britain and that red revolution is a bogey and nothing more. Michael P. Schwartz, a German-American millionaire, has matured a plan to wreck the British Empire when he finds an unexpected obstacle in John Sydney, a candidate for Parliament in the coming election that is to return a Bolshevist Government. Sydney's opponent is a follower of Schwartz and organises riotous scenes during the canvassing, the result of which may or may not come as a surprise to the reader. How Sydney falls in love at first sight with Schwartz's ward, how he is kidnapped by the Reds, and how his friends try to save his life in time to rescue the charming ward from captivity and possible death, form the main plot of the story. This is not, however, simply a love story and nothing more. It is true that some of the incidents are too melodramatic and, it is hoped, too impossible for England; but they owe their exaggeration to Mr. Taunton's earnest endeavour to warn the patriotic Briton against the very real dangers to which his easy-going trustfulness has always laid him open.

Broadcast Reception in Theory and Practice. By J. LAURENCE PRITCHARD, F.R.Ae.S. Pp. xii + 259; figs. 163. London: Chapman & Hall, Ltd. Price, 8s. 6d. net.

Mr. Pritchard tells us in opening his preface that "this book is intended for that large and growing class of wireless enthusiasts who wish to do a little more than construct wireless sets from given instructions." It has thus at the start a distinct advantage over many books recently published on radio telephony in that it is written for one definite class of readers, and, as the author is Technical Editor of "Harmsworth's Wireless Encyclopedia," it has the additional advantage of having been written by one who knows the wants of that class of readers, and how their wants can be adequately met.

Provided "the wireless enthusiast" has an elementary knowledge of mathematics, the principles of electricity, and the use of tools, he cannot fail to be benefited by a study of this book, generally as a text book, or more narrowly as a book of reference in those times of doubt or trial, the inevitable crosses of all enthusiasts.

The contents of the book cannot be summed up better than in the words of the title, and the amateur experimenter will find in its pages a self-contained, accurate and up-to-date exposition of the theory and practical application of the principles of broadcast reception.

It is interesting, and possibly prophetic, to find that Mr. Pritchard, like Sir Oliver Lodge in his latest book on wireless, recommends the student to use units of length for capacity and inductance, and it is refreshing to find that he strongly recommends the use of really good transformers and ample batteries, as there is certainly a tendency at the present time for experimenters to spoil their work by ill-advised economy on these two important items in their installations.

In addition to many illustrations, much useful information is given in the form of tables and curves.

This is a book which we hope will be welcomed, as it deserves to be, by a large circle of serious amateur experimenters.

Insulated Electric Cables. Part I. Materials and Design. By C. J. BEAVER, M.I.E.E. Pp. 264; figs. 71. London: Ernest Benn, Ltd. Price 36s. net.

Mr. Beaver needs no introduction to our readers. For many years he has been one of the leading authorities on questions affecting the design and manufacture of cables, and has made valuable contributions to our knowledge of the subject. He has now laid both cable makers and cable users under a further debt of gratitude by putting before them in a concise form the results of long and active experience in the industry. He has produced a valuable book of reference which we think will be the standard work on cables for a long time to come.

The volume which we have received is the first of two, and deals with materials and design. Vol. II, which will appear later, will be devoted to manufacture, testing and use.

In Vol. I the author first traces briefly the development of electric cables over the past 30 or 40 years, and then devotes half the book to a very able and detailed examination of the wide range of raw materials employed as conductors, insulators, and for protective purposes in modern cable manufacture. Design problems, which constitute the second half of the volume, are similarly divided; but, owing to the complicated nature of dielectric knowledge, the greater part of this space is devoted to the consideration of different types of dielectrics, their various electrical, physical, mechanical and chemical properties, and to the several important factors controlling voltage rating.

The book is well illustrated, and contains a mass of valuable data embodied in the form of tables and curves. The diagrams are well drawn, though we must take exception to fig. 31 on p. 170. In plotting the connection between the viscosity and temperature of different cable compounds the author has made the abscissae, instead of the ordinates, the dependent variable. These curves would also have been of greater value if they had been carried to lower temperatures, but we suspect that the limitation was not lack of appreciation of the point so much as difficulty in measuring the values with the particular viscometer used. We feel, too, that it might have been wiser in connection with Table VI of lead analyses, on p. 109, not to have given so many decimal places in the impurity content. The table, as it stands, will give users a wrong impression of the accuracy of ordinary everyday analyses.

Generally speaking, the information contained in the volume is well up-to-date, and shows that the author has kept a watchful eye on the mass of material which has appeared during the past few years. This flood of new developments must have embarrassed him during the preparation of the chapters, and we see that, although he has caught copper cadmium, on p. 53, he has himself been caught by the price of rubber on p. 90.

The very complete treatment of raw materials is evidently based on a long experience, and many readers will find the tracing of the materials back to their origin an absorbing study. There will be some, however, who will feel that the author has gone further back and into greater detail than is justified by the title of the book. The refining of copper and aluminium, for instance, are dealt with very fully, and we fear that, interesting as these origins are, the seeker after cable knowledge may be distracted rather than helped. The shape of the bed in a paper hollander is a long way removed from cable manufacture, and the inclusion of detailed information on the sizing of paper or on the manufacture of wagon grease is evidence rather of the cathocity of the author's interests than of their importance to the subject in hand.

The author is not always strictly logical. For instance, he says on p. 168 that the chief object of using a wood-pulp paper is economy in first cost, bearing in mind, presumably, his own test results shown in the curves on pages 246 and 247, and then proceeds to talk of the futility of comparing the properties of papers on the basis of composition when texture may be the deciding factor. We can scarcely think that the widespread and growing feeling against manila paper is due to the cause laid down by the author on p. 57. The results of electrical and ageing tests made by other investigators are surely more probable reasons than any question of foreign competition.

To carry our criticism over to the opposite side, we feel that in some respects the author is too modest. The reader wonders, for instance, why, on p. 21, he quotes two out-of-date authorities where he might give his own view at the time of writing, and in discussing the merits of rosin oil and mineral oil on p. 67, he withholds his own personal opinion on their relative merits.

In the matter of nomenclature the opening of Section III—Design—with the valuable and spirited attack on philological inexactitudes and other enemies to clearness in discussion, was a happy thought. What a pity, then, that the author from page 1 to page 128 vacillates between the use of the names resin and rosin for the same material!

A striking feature of the book is the evidence in every chapter of the author's practical knowledge of the subject. Good examples are the interesting and chatty pages 102-105 on varnished cambric cables, and pages 154-156 on shaped conductors. Again, on page 175, Mr. Beaver fulfils the function of an authority by dispelling errors with no uncertain hand. The inter-action of the copper conductor, its tinned coating, the rubber, and the sulphur, in a rubber cable are very much misunderstood, but the author's explanation puts the matter very clearly; in fact, the entire chapter on rubber dielectrics being so concise will prove a welcome addition to the existing literature.

Chapters IX and X, on dielectric properties and voltage rating, constitute a valuable summary of a wide and difficult subject showing the author's extensive knowledge of the work published and his appreciation of the limitation of existing theories.

The absence of any mention of the design of dry-core telephone cables strikes us as a serious omission in view of the broad title of the book, particularly as, by the adoption of a paper less than 7 mils thick for the present 264 pages, a chapter on this subject might still have been squeezed in without reducing the dignity of the volume with its 3 lb. 5 oz. avoirdupois and high price, or cutting out the twenty-four pages of advertisements which get in the way whenever the index is required.

In addition to producing a valuable technical treatise Mr. Beaver has rendered a great service to the British cable industry by showing the extent to which attention is given to detail in the production of British cables and, although his publishers

have seen fit to include a foreign manufacturer among the advertisements, we feel that cable users reading the book will be quite satisfied that in placing their orders for cable in this country they are reaping the benefits of the highest scientific and technical skill.

We shall look forward to the appearance of Vol. II with a lively interest.

Parliamentary News.

[By Our Special Parliamentary Reporters.]

Third Readings.—In the House of Lords on June 3rd, the Colwyn Bay Urban District Council Bill and the Kidderminster and Stourport Tramways Bill were read a third time and passed. The Ascot District Gas and Electricity Bill was read a third time in the House of Commons on June 4th.

Post Office Tube.—On June 4th, Col. DAY asked the Postmaster-General if he would state the amount already spent on the work in connection with the Post Office tube railway; the estimated cost for the completion of the scheme; and when it was anticipated that the railway would be ready for operation.

Sir W. MITCHELL-THOMSON said that the amount expended to date was £1,420,000, and it was estimated that about £260,000 would be required to complete the undertaking. It was hoped that the railway would be available for traffic in the autumn.

Breach of Contract by Public Works Employés.—On June 7th, Sir EVELYN CECIL asked the Home Secretary if he would state what steps his department took under Section 4 of the Conspiracy and Protection of Property Act, 1875, and Section 31 of the Electricity (Supply) Act, 1919, for breach of contract against persons employed in the public supply of gas, water, or electricity; and how the posting-up of a notice of these sections in the works as required by law was ensured.

Capt. HACKING, the Under Secretary to the Home Office, said that the matter did not fall within the scope of the Home Office. It was open to any person who was aggrieved to take action if an offence was committted.

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from the dates mentioned. In the case of foreign applications, the name and address of the British representatives are also given :—

May 19th.

Design only. No. 457,156. Class 8. Portable instruments and apparatus for use in radio-telegraphy and telephony.—Pell, Cahill & Co., Ltd., 64, Newman Street, W.1.

Resistoflex. No. 468,353. All goods in Class 8.—Spicers, Ltd., 19, New Bridge Street, E.C.4.

Rubite. No. 468,725. Class 8. Electric cables.—W. Brown & Co. (Engineers), Ltd., 89, Douglas Street, Glasgow.

May 26th.

Lewcos. No. 464,502. Class 8. Electric coils. Lewroidal. No. 468,849. Class 8. Coils for use in radio-telegraphy and telephony.—London Electric Wire Co. & Smiths, Ltd.

Orion. No. 465,674. Class 8. Electrical appliances of all kinds.—Magyar Wolframlampa-Gyar Kremenezky Janos Reszvenytarsusag, Budapest. (Dicker and Pollak, 20-23, Holborn, E.C.1.)

Cossor. No. 466,824. Class 8. Thermionic valves, electric lamps (philosophical), vacuum tubes, electric signs, X-ray tubes and apparatus, electric batteries, meters, resistances, switchboards, contact breakers, induction coils, transformers, radio-telephonic and telegraphic apparatus, electric furnaces (experimental), &c.—A. C. Cossor, Ltd.

Weilo. No. 468,248. Class 8. Transformers and radio-telegraphic and telephonic appliances.—H. Wieland, Berlin, S.W.61. (W. Bryson, 29, Southampton Buildings, W.C.2.)

Ivric. No. 463,852. Class 50. An electrical insulating material made principally of ground bone and casein in rods and sheets, and electrical insulators made of such material.—Completion Syndicate, Ltd., 136-138, Bishopsgate, E.C.2.

Linerfex. No. 468,584. Class 50. Insulating material for electrical purposes.—The Ioco Rubber & Waterproofing Co., Ltd.

Published Specifications.

Compiled expressly for this journal by Patent Agents.

The name of the applicant's patent agent, if any, will be found on the printed specification.

The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

28,000. "Electromagnetic mechanisms." Automatic Telephone Manufacturing Co., Ltd., and A. E. Hudd. November 22nd, 1924. (Addition to 195,824.) (251,317.)

1925.

2,413. "Electric batteries." British Battery Co., Ltd., and J. W. H. Reynolds. January 27th, 1925. (251,328.)

2,527. "Radio-receiving sets." C. C. Blackmore. January 28th, 1925. (251,332.)

2,534. "Telephone exchange systems." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (L. J. J. Schreiber). January 28th, 1925. (251,335.)

2,614. "Directional radio-receiving system." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). January 29th, 1925. (251,337.)

2,617. "Electrical driving mechanism for rotary tools for use in the tre ment of leather and hides or skins." Etablissements Reynier (Soc. Ano and C. Szmukler. March 27th, 1924. (231,434.)

2,622. "Electrically-operated point or switch machines for railways S. L. Glenn and E. E. Pierce. January 29th, 1925. (251,339.)

2,669. "Lamp signalling devices, particularly for use in controlling traffic F W. C. Bilby. January 30th, 1925. (251,340.)

2,685. "Electric secondary batteries or accumulators." H. F. Joel, a January 30th, 1925. (Addition to 230,184.) (251,342.)

2,797. "Electric telephones." M. Walker. January 31st, 1925. (251,349

2,936. "Electric condensers for use in wireless receiving apparatus." A. Peplow. February 2nd, 1925. (251,358.)

2,954. "Current transformers." E. Pfiffner. February 2nd, 1924. (228,57

3,210. "Impulse transmitters for use in telephone or like systems." Au matic Telephone Manufacturing Co., Ltd. June 7th, 1924. (235,136.)

3,214. "Sound-radiating means suitable for use with loud-speaking te phonic receivers and other sound producing or reproducing apparatus." E. Graham. February 4th, 1925. (251,365.)

3,520. "Electric circuits supplied by electric generators driven by win mills." L. Constantin and P. Fortier-Beaulieu. February 12th, 192 (229,291.)

3,891. "Electrical circuits for wireless telegraphy, telephony, or the like C. A. Cleghorn. February 11th, 1925. (Cognate application 8,340/2 (251,374.)

3,958. "Electric discharge devices." Westinghouse Electric & Manufactu ing Co. February 20th, 1924. (229,654.)

4,417. "Electrical connector." L. F. Summers. February 17th, 192 (251,377.)

5,211. "Trunk offering final selectors for use in telephone systems." Sta dard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.) a L. P. Lowry. February 25th, 1925. (251,385.)

5,688. "Automatic or semi-automatic telephone systems." Standard Tel phones & Cables, Ltd. (formerly Western Electric Co., Ltd.) and J. R. Goul March 2nd, 1925. (251,387.)

7,016. "Holders for thermionic valves." H. Terry & Sons, Ltd., and A. Terry. March 16th, 1925. (251,397.)

7,777. "Electric differential control system." E. Granat and Compagn des Forges et Acieries de la marine et d'Homecourt. April 19th, 192 (232,571.)

7,902. "Thermionic valves." Edison Swan Electric Co., Ltd., and T. Price. March 24th, 1925. (251,406.)

8,171. "Detectors for high-frequency electrical oscillations." H. Wa (Carborundum Co.). March 26th, 1925. (251,408.)

8,247. "Control of electric switches operated by impulses." Siemens Bro and Co., Ltd., and H. E. Humphries. March 27th, 1925. (251,410.)

8,470. "Illuminated signs." E. C. R. Marks (Wayne Tank & Pump Co. March 30th, 1925. (251,414.)

8,964. "Control of dynamo-electric machines." British Thomson-Houst Co., Ltd. April 3rd, 1924. (231,891.)

9,594. "Headlamps suitable for use on motor-cars." G. Herbert. Apr 14th, 1925. (Cognate application 12,176/25.) (251,417.)

10,276. "Detecting devices for electric circuits." British Thomson-Houst Co., Ltd., H. C. Wheat, and F. M. Cocksedge. April 20th, 1925. (251,425.)

11,046. "Method and device for detecting and locating ores by electr magnetic means." E. C. R. Marks (Aktiebolaget Elektrisk Malmletning April 28th, 1925. (251,429.)

12,428. "Electric motor-starting switches." Brookhirst Switchgear, Ltd and J. A. Hirst. May 13th, 1925. (251,440.)

13,137. "Shades or reflectors for electric lamps." R. R. Palmer. Ma 20th, 1925. (251,445.)

14,846. "Electrical generators." D. Mendelson. June 8th, 1925. (251,461

16,778. "X-ray tubes." Naamlooze Vennootschap Philips' Gloeilampe fabrieken. July 23rd, 1924. (237,580.)

16,843. "Electrical regulator systems and devices." Metropolitan-Vicke Electrical Co., Ltd. October 14th, 1924. (241,523.)

17,648. "X-ray apparatus." Dr. W. Moppett. July 9th, 1925. (Conve tion date not granted.) (251,477.)

17,922. "Electric furnaces." E. C. R. Marks (Scovil Manufacturing Co. July 13th, 1925. (251,484.)

17,928. "Thermionic valve holders." W. H. Dovey. July 13th, 192 (251,485.)

18,121. "Mercury lamps." H. Nagaoa, T. Asada, and T. Machida July 15th, 1925. (251,486.)

18,814. "Plates for electric storage batteries or accumulators." G. F Judd and W. A. Millington. July 23rd, 1925. (251,487.)

18,815. "Electric storage batteries or accumulators." G. F. Judd an W. A. Millington. July 23rd, 1925. (251,488.)

18,816. "Electrodes for electric storage batteries or accumulators." G. F Judd and W. A. Millington. July 23rd, 1925. (251,489.)

19,474. "System for transmitting electrical impulses, particularly for us in automatic telephone exchange systems." A. Barnay. November 8th, 192 (242,594.)

20,434. "Electrode holders for electric furnaces." D. M. Crist. August 14th 1925. (251,497.)

22,017. "Electrode-holder for electric furnaces." Studien Ges. fur Wirt schaft U. Industrie. September 5th, 1924. (239,522.)

22,026. "Control of polyphase crane-driving or like motors." J. W. Kirk land (Allgemeine Elektricitats-Ges.). September 3rd, 1925. (251,503.)

22,132. "Electric connecting devices provided with automatic cut-outs." E Blattmann. September 4th, 1925. (251,504.)

23 754. "Thermostatic switches for electric heating elements." M Klettner. September 23rd, 1925. (251,510.)

24,365. "Bushings for electrical apparatus." British Thomson-Houston Co., Ltd. September 30th, 1924. (240,839.)

25,241. "Wireless antennæ." J. M. Clark. October 9th, 1925. (251,521.)

25,409. "Switches for electric pocket-lamps and portable electric hand-lamps." Elektrotechnische Fabrik Schmidt & Co. Ges. February 28th, 1925. (248 322.)

26,926. "Fixing device for the magnet of an electricity meter." Soc. Genevoise d'Instruments de Physique. February 3rd, 1925. (247,151.)

26,927. "Ferraris electricity meter." Soc. Genevoise d'Instruments de Physique. July 4th, 1925. (251,536.)

27,093. "Reactive component indicating meter or wattless component energy meter according to the induction principle." Landis & Gyr Soc. Anon. December 24th, 1924. (245,074.)

27,723. "Apparatus for selectively cutting-out a rectifier when flashing-over occurs therein." Akt. Ges. Brown, Boveri et Cie. August 31st, 1925. (251,539.)

28,062. "Insulators." M. F. H. Gouverneur. November 11th, 1924. (242,983.)

28,139. "Arrangement for cooling the stators of electrical machines." Thyssen & Co., Akt. Ges., A. Glaubitz, and R. Simeith. November 9th, 1925. (251,542.)

28,624. "Radiating antenna systems." British Thomson-Houston Co., Ltd. November 25th, 1924. (243,706.)

31,932. "Electrically-actuated horns and the like." G. Ingrassia. December 18th, 1924. (244,798.)

32,349. "Electric motor controllers." Igranic Electric Co., Ltd. (Cutler-Hammer Manufacturing Co.). December 22nd, 1925. (251,559.)

1926.

1,934. "Electric fires or radiators." H H. Berry. January 22nd, 1926. (251,568.)

2,126. "Traffic signalling systems." British Thomson-Houston Co., Ltd. January 24th, 1925. (246,515.)

4,706. "Thermal-electric generators." British Thomson-Houston Co., Ltd. March 31st, 1925. (250,187.)

4,802. "Vacuum electric tube devices." E. Y. Robinson and Metropolitan-Vickers Electrical Co., Ltd. December 31st, 1924. (Divided application on 251,673.) (251,572.)

The

Electrical Review

VOL. XCVIII. JUNE 18, 1926. No. 2,534

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

LIST OF FOREIGN AGENTS (see first page "Official Notices").
